To facilitate the induction of inmates into the army when their sentences expired, selective service boards were set up in all federal and state prisons during 1943. Not all released felons, though, were inducted. Those convicted of the more serious crimes, as well as alcoholics, sex perverts, drug addicts and habitual offenders, were barred Some states (Kentucky, Oklahoma, Texas, New Jersey, Michigan) which enacted legislation soon after Pearl Harbor permitting the parole of worthy inmates *prior* to the expiration of their sentences (if the army would accept them) continued that practice, with excellent results. Only a handful of men so paroled relapsed into crime.

Because of the war—and the consequent restricted use of vital materials, no new buildings were erected in the prisons. In many, though, educational facilities were extended—particularly in vocational fields—to prepare inmates for war work within the prison, or upon their release.

With the exception of England, no information was available about prisons and crime in Europe. In that country, juvenile delinquency, rampant after the outbreak of the war, decreased considerably due to co-ordinated efforts on the part of social agencies and groups of interested citizens. And in the prisons, the inmates continued to aid in the war effort They produced considerable matériel and worked on either institutional or private farms. (*See* also CHILD WELFARE; CRIME.) (L. E. Protestant Episcopal Church.

During the year 1943 the continuance of the world-wide war deeply affected the life of the Episcopal Church. So many of the clergy volunteered for service as chaplains in the armed forces that the proportional quota of chaplains assigned by the war department to the Episcopal Church was more than filled.

The statistics for the year showed increases in some items, decreases in other items. The total number of baptized persons, 2,188,573, and the total number of communicants, 1,520,394, were the largest ever reported in the history of the church but the number of confirmations showed a slight decrease and the number of church school pupils showed a decrease of more than 35,000. The total of contributions for all purposes, $38,288,766, was an increase of $2,977,456 over that of 1942.

Because of war conditions, the triennial general convention, held this time in Cleveland, Ohio, was shortened to a period of only eight working days, but the necessary business was accomplished. A budget of $2,615,382 was adopted for the general missionary work of the church in 1944 with provision for increases in 1945 and 1946. In the adoption of this missionary budget special emphasis was placed on the need for more effective work among the Negro population of the United States and upon the great missionary opportunity open in China. Psychiatry.

Shock Therapy.—The three forms of "shock" therapy used in the treatment of mental diseases were evaluated. A series of 15 or 20 insulin "shocks" are usually given to each patient over a period of a few weeks. When used to treat schizophrenia or dementia praecox, the recovery rate exceeds that found following any other type of treatment.

Little more than 1% of the 48,772 patients with dementia praecox in New York civil state hospitals in 1941 recovered under all other forms of treatment. More than 350 patients, however, treated by the insulin shock method, recovered; 28% more showed major improvement and another 28% were somewhat improved. This drastic form of treatment, therefore, increased the recovery rate by ten times. It was five times more efficient than electric shock or the convulsive treatment initiated by metrazol injections. The drug was ineffective in restoring to usefulness mental defectives, the aged, or patients deteriorated by structural brain disease. Electric shock, a convulsive agent which largely replaced metrazol, appeared to have particular value in affection disorders and in the involutional states. Both metrazol and electric convulsive therapy, most observers agreed, are of small value in the treatment of schizophrenia. Although shock treatments in general did not live up to the claims of their early sponsors, an important therapeutic method was added to the small stock of agents formerly known to change the course of mental disease.

Psychosurgery.—Operation on the frontal lobe of the brain as a means of treating mental disease was first introduced by Moniz in 1935. The technique of prefrontal lobotomy or leucotomy, as the operation is called, was modified. M. C. Petersen, who treated 41 patients, without any fatalities, found that many showed a relief from anxiety and were able to be cared for in their homes. Walter Freeman and J. W. Watts noted that their patients exhibited certain characteristics different from their prepsychotic self. The patients were more likely to be indolent, often were outspoken, saying the first thing that came into their heads, and were often hasty, undiplomatic and tactless. They were sorry for their attitude and often apologized. Emotional reactions were brisk, shallow and short-lived. The brooding, melancholy, hurt feelings and grim silences, characteristic of their preoperative state, entirely disappeared. They harboured no grudges. The intellect was intact. With the passage of time, there was often further improvement in social adaptation, even through the third to the fifth year. In general, the operation gave better results than formerly anticipated, and in selected cases of chronic depression of long-standing where the prognosis was particularly poor, prefrontal lobotomy was the treatment of choice.

Epilepsy.—Most epileptics have abnormal electroencephalograms, a condition known as cerebral dysrhythmia. Brain waves, moreover, have individuality and the pattern is an hereditary trait. W. G. Lennox showed that similar twins have indistinguishable electroencephalographic records. In members of the immediate family of epileptics abnormal tracings were found in over 50%, a much higher incidence than in the general population. These studies led to the conclusion that epilepsy is not inherited, but that a predisposition or susceptibility is inherited Behind the abnormal pulsations of the brain lies the unknown chemistry of discharging nerve cells. Studies of arterial and venous blood from the brain area indicated that in epilepsy there is a lower concentration of carbon dioxide in the blood and the brain burns less glucose per unit of oxygen than in normal people.

Group Psychotherapy.—Group treatment of the neuroses was developed in many clinics and hospitals. Alfred Hauptmann reported that 90% of the neurotics ordinarily encountered by

physicians and seen in the out-patient department of hospitals can be treated successfully by this method. Each patient should be guaranteed, however, individual approach before he enters the class and in some cases this is necessary. Subordination to the class leader is one of the main curative principles, and it can be achieved more easily by group than by individual treatment. Teaching is primarily by lectures. Donald Blair tried the same method in the treatment of the neuroses in the war cases. He used general typewritten statements for distribution, individual interviews, autobiographies and a series of ten lectures. The results were satisfactory and group psychotherapy appeared to be well worthy of trial in the medical departments of the fighting forces.

Alcoholism.—A growing interest in the medical aspects of alcoholism is reflected in the current literature on the subject The *Quarterly Journal of Studies on Alcohol,* established in 1939, became a focal point for the publishing of scientific contributions. William Fleeson and E. F. Gildea analysed such a group. The largest number were "exogenous drinkers," with heterogeneous origins of their drinking habits and without any single personality type predominating. Many in this classification were able to make personality adjustments to their drinking habits. A smaller group were the true addicts, who suffered from addiction at the beginning of their use of alcohol. Although they might have good insight into the problem, their personality make-up would not allow them to give up drinking. The smallest group were the "symptomatic drinkers," also endogenously determined. The underlying cause was usually a psychosis, their inebriety being only a secondary manifestation of a more profound psychological state. After many years of exogenous or symptomatic drinking, moreover, patients may become secondarily addicted.

Joseph Thimann reported on his use of the conditioned reflex in the treatment of the abnormal drinker. The unconditioned stimulus was an emetic, consisting of a solution of emetine, pilocarpine and ephedrine. The conditioning treatment required many other controlled factors, including a special room excluding all extraneous auditory, olfactory and visual stimuli. The positive auditory stimuli were at the same time reinforced, such as the clinking of bottles and glasses, the sound of poured liquor and the effects of retching and vomiting. Treatment was given in session on four to seven successive days, and repeated after one to 12 months. The results depended largely on the selection of patients, not being good in psychopathic cases. Under expert hands, with a careful evaluation of the patients and with fully controlled environmental conditions, the method, as reported by Thimann and others, was effective.

The clinical aspects of alcoholism were summarized by E. M. Jellinek in a book devoted to studies on the aetiology and treatment of abnormal drinking and to the mental and physical disorders associated with it. The volume is the first of a projected series on the "Effects of Alcohol upon the Individual," undertaken by the Research Council on Problems of Alcohol, organized in 1937 and affiliated with the American Association for the Advancement of Science.

War Psychiatry: Selection of Recruits.—The great number of neuropsychiatric casualties in World War I, the prolonged and costly care of the veteran with nervous and mental disease in all countries and the growing awareness of the problem in field units as well as hospital organizations, in line officers and doctors in World War II led to a more careful selection of men before induction into the service than at any time in the history of medicine. The "screening" in the United States and elsewhere was not entirely successful. The reason in the U.S. lay largely in the fact that psychiatric resources were not evenly spread throughout the country. Competent psychiatrists were not available in many parts of the country. There was an attempt, however, to eliminate the unfit during the training period, but in places where there was official apathy many men remained in the service, only to break down under the great strain of modern, active combat. Some neuropsychiatrists tended to over-exaggerate the importance of neuropsychiatry as a part of military medicine, but in general line officers were expressing a willingness to recognize functional and mental disorders, in contrast to the attitude prevalent in World War I. Psychiatrists with actual battle experience, as pointed out by G A. Blakeslee, tended to eliminate a larger percentage of recruits than those who had never seen men break down under fire.

L. R Gowan showed that from one-half to two-thirds of the men who developed neuroses in the army were predisposed to such a disability before induction. There was no place in the army for the so-called "problem" boy. Military service did not eliminate these problems, but only tended to aggravate them, resulting in more serious or often permanent disabilities. War brings about many situations that require the individual to make extensive emotional adjustments. War neurosis, as stated by Gowan, is not a new disease, but merely the appearance of previously existing neurotic tendencies brought to the surface and organized into form by exposure to war's demands. To discover these tendencies in a recruit should be the primary function of an examining psychiatrist.

The Nature of the War Neurosis.—W. R. D. Fairbairn found in his examination of British cases, that in nearly every man treated there was a history of previous psychopathologic experiences. The war only served to activate a pre-existing, if latent, abnormal reaction. The chief symptom was a separation-anxiety, which he found always present in war neurotics. The capacity to endure danger usually varied with the extent to which the individual had outgrown the stage of infantile dependence. The compulsion to return home was often displayed, sometimes in the form of a fugue or in a consciously executed flight. The author found that the group spirit was the essence of morale, the phenomenon of panic in a military unit being basically one of separation-anxiety affecting all or usually all members of the group simultaneously. High morale, moreover, within a group exercised a profound influence in counteracting the ill effects of infantile dependence among its members.

Alexander Simon and Margaret Hagan also reported, after a study of 400 psychiatric casualties in United States navy and marine corps men, that previous mental illness, broken homes, psychosis in the family, faulty education, occupational maladjustment, antisocial behaviour and alcoholism were found in a study of complete social histories. Broken homes occurred in nearly one-half of the cases.

Sodium amytal narcosis, according to L. L. Altman, became of increasing importance in the treatment of war neuroses. Its use was first emphasized by Sargant. The use of the drug must be preceded, accompanied and followed by psychotherapy in the form of investigation, explanation, positive suggestion and reassurance.

E. R. Smith stressed the great strain under which modern warfare is carried out. During the occupation of Guadalcanal by the United States marine corps, sleep and eating were almost impossible. Weight losses ran as high as 45 lb. Rain, heat, insects and malaria contributed to the disorder of thinking and living. This strain persisted and increased for months. The complaints and symptoms were identical for each individual—headaches, lowered thresholds to sharp noises, periods of amnesia and of panic, sensory somatic complaints, marked muscular hypertonicity, tremors and palsies. Intellectually normal, the men were emotionally unstable and showed unbelievable neuromuscular

tension. Fear of cowardliness was almost universal. Few cases could be returned to full or combat duty, but most of the men leaving service, in the author's opinion, should be able to return successfully to civilian life.

Aubrey Lewis examined some of the more severe neurotics after they had returned to civil life and found that a large number were able to take their usual place in society.

Aviation Medicine.—E. G. Reinartz, commanding officer of a United States school of aviation medicine, reported that, while the exigencies of the air service beget no novel or unique psychological phenomena, they increase the incidence of certain syndromes. Aeroneurosis is a chronic functional nervous and psychic disorder characterized by gastric distress, nervous irritability, insomnia and minor psychic disturbances. It is, moreover, likely to occur in the professional or experienced pilot and is commonly known as "staleness." Emotional stress is the principal exciting factor, since in order to fly it is necessary for a pilot to repress many thoughts which provoke emotional reactions. If such repression is not successful, conflicts will arise, for the instinct of self-preservation which is frequently stimulated in aviation arouses many profound emotional disturbances. Even if fear is repressed subconsciously, pilots are affected by it every time they go into the air. The flight surgeon detects signs of aeroneurosis quickly, often before the pilot himself is aware that anything is the matter. A second syndrome, according to Reinartz, is "flying fatigue." This is the result of highly abnormal flying strain such as occurs in battle conditions and is not characterized by emotional factors such as appear in aeroneurosis. The onset is slow, but once started development is often rapid, leading to deterioration and disintegration of mental and physical faculties. In order to diagnose the condition in its earliest state, the flight surgeon must be closely associated with the pilot's case. These two conditions are separated from aeroembolism produced by rapid decrease of pressure below one atmosphere. The symptoms depend on bubbles of nitrogen escaping from the blood and lodging in various parts of the body. It appears in high-altitude flying and, as was pointed out by M. N. Walsh, there is considerable individual variation with regard to the ability of pilots to withstand high altitudes. Ordinarily, mental symptoms do not occur when flying below 9,000 ft. Above 12,000 ft. symptoms occur with rapidity, such as a decrease in acuteness of hearing and vision, blunting of judgment, impaired critical perception, indolence of thought, forgetfulness and absentmindedness. There may be changes in mood and diminution or loss of the will to perform certain duties, although the ability to perform them may be essentially unimpaired. The pilot himself is often unaware of these effects. When flying above 18,000 ft. all symptoms are exacerbated. These reactions are reversible by the administration of oxygen if given in time, but at a level of 40,000 ft. the time is only 30 to 60 seconds and only 15 seconds if activity is being carried out. In high-altitude flying an uninterrupted supply of oxygen was, therefore, indispensable for pilots operating above 12,000 ft. In addition, there were the grave accidents which occurred because of nitrogen emboli and the execution of turns and dives might produce anaemia with structural damage to the brain.

(H. R. V.)

Psychology.

American psychology during 1943 had a three-dimensional orientation: (1) its continued application in the prosecution of the war; (2) its attention to peace and postwar problems; (3) the continued development of pure psychological research.

As in World War I American psychologists were called upon for solutions of the problems involved in the classification of military personnel in the armed forces of the United States. The committee on classification of military personnel, a group of prominent psychometricians under the chairmanship of Walter V. Bingham, acts as an advisory body to the adjutant general,

SELF-ANALYSIS was advanced as one of the methods of experimental depth psychology by Dr. Werner Wolff, expatriate German psychologist in the United States, in his book *The Expression of Personality* (Harpers, 1943). In one test, the subject is asked to comment upon two composite photographs of himself, taken without his knowledge. The portrait is split down the middle, reversing one half, and fitting it against the remaining half. The subject's reactions to his "left" and "right" faces, usually strongly negative or positive, provide definite clues to his personality, according to Dr. Wolff

who was directed by the secretary of war, in June 1940, to assume central authority for the classification of all men in the army.

The actual administration of personnel procedures in the army was handled by the classification and enlisted replacement branch under the adjutant general's office. The officers who administered the program in the field were psychologists and personnel technicians who had special training at the adjutant general's school established in 1941 at Fort Washington, Md. The more significant psychological contribution, however, was made by the personnel research section of the classification branch under the direction of M. W. Richardson. This section constructed and revised the many tests demanded by the army's general and specialized needs. These demands could not be met by the rigid application of old psychological instruments. They required a program of constant research and experimentation which had, however, to be concerned solely with actual and urgent army situations. In addition to tests, the section prepared standardized aids for the field work of the army's classification officers: manuals of test administration, interview schedules and rating forms.

The first important step in the classification of the army recruit was the administration of a minimum literacy test to detect the men who would not be able to absorb army training—a large part of which was based on manuals and other written material. Men failing the literacy test were given a visual classification test to select the illiterates with sufficient native ability to learn military duties. The next step for literate men was the army general classification test on the basis of which soldiers were grouped into five categories according to their learning capacity. In addition, men took the mechanical aptitude test and the radio telegraph operator aptitude test and their scores helped determine their assignment to specialist training in mechanics or radio-telegraphy. Experiment showed the best single test for radio-telegraphy to be a work sample test of code learning. Auditory discrimination proved to be not quite as significant.

Initial assignments of men were based both upon test scores and upon the results of a standardized interview yielding data on such items as education, languages, occupational history, hobbies, leadership experience and previous military training.

Slow learners were placed in special training units under experts who had developed a good deal of original instructional material designed to increase motivation by its freedom from rigid and static content. In this way psychological training salvaged many recruits who would otherwise have been dismissed as mentally unqualified.

The need for highly trained technicians and officers was so great that the army utilized the resources of the country's universities in establishing the army specialized training program. Under the terms of this program soldiers were assigned to those colleges where the army had set up a curriculum. The ASTP included a basic phase and an advanced phase, the latter of which was divided into various specialized curricula. Criteria for admission to the ASTP included high scores on the army general classification test and on an educational achievement test also prepared by the personnel section.

The advanced phase of ASTP offered a curriculum in personnel psychology during 1943 at 11 leading U.S. universities for the purpose of increasing the number of trained personnel psychologists in the army. The total number of men assigned to these schools in 1943 was 1,350.

The National Research council's emergency committee in psychology established a sub-committee on a textbook of military psychology in 1942 to prepare a textbook for men in the armed forces. This volume appeared during 1943 as the co-operative effort of 59 psychologists with E. G. Boring, editor-in-chief. The book is a nontechnical presentation for the soldier of psychological facts and principles which bear upon military problems. Major attention is given to perception and the sense organs; but individual differences, training, efficiency, motivation, adjustment, mobs and rumours are also included.

The selection and classification of pilots was under the direction of the office of the air surgeon, army air forces. Aviation applicants had to pass, first, the aviation cadet qualifying examination which was primarily a test of pilot aptitude. Later the cadet took the aviation cadet classification tests, a series of 20 tests taking two days to administer. These tests were developed and were in the process of experimental modification by a large staff of psychologists. They measured the following types of function: (1) intelligence, judgment and proficiency, (2) alertness, observation and speed of perception, (3) personality, temperament and interest, (4) visual-motor co-ordination.

During 1943 the belief grew among psychologists that the winning of the war and the winning of the peace were different aspects of the same process. The general hypothesis that the nature of victory was related to a durable peace not only received acceptance but the emergence of specific postwar reconstruction problems before the end of the war became apparent. For example, the returning soldiers discharged because of physical injury or mental illness were challenging psychological resources for rehabilitation. In March 1942 the first rehabilitation clinic was held at Yale university for purposes of vocational and psychological counselling and in the course of the following 15 months over 60% of the clients tested were placed in jobs. In 1943 Stanford university established a course in psychology for rehabilitation workers emphasizing the physiological psychology of motor functions, optimal procedures for making and breaking motor habits, psychological adjustment and the mental hygiene of the hospitalized person.

One expression of this interest in postwar problems was manifest in the creation of a committee on the psychological aspects of postwar planning by the Society for Psychological Study of Social Issues under the chairmanship of Gardner Murphy. This committee co-ordinated research and information on major psychological obstacles to permanent peace; on the school systems of the various world powers as they bore on the development of war and peace attitudes; on American attitudes toward the postwar world. The implementation of research into psychological areas of understanding and attitude was furnished in part by the Office of Public Opinion Research of Princeton university which had been systematically sampling the opinions of the American public on a nationwide basis on postwar problems. This research institute reported that the majority of the American public in all major income groups wants co-operative national planning after the war in which government, business, labour and agriculture will participate. Other nation-wide attitudinal research was in agreement that the American people favoured international organization to preserve the peace but that their thinking was unstructured concerning the instrumentalities for achieving this end. Thus many clung to specific beliefs in high tariff barriers and immigration restrictions while accepting the general desirability of international co-operation. This was consistent with previous psychological research which indicated that the acceptance or rejection of general symbols could be accompanied by contradictory beliefs concerning specific, related proposals.

Another indication of the growing interest in psychological peace problems appeared in the April number of the *Journal of Abnormal and Social Psychology* which was given over to articles on "Psychological Considerations in Making the Peace,"

with contributions from E. C. Tolman, K. Lewin, C. Buhler, F. Schreier, K. Bode, O. H. Mowrer and R. Stagner. The discussion covered such problems as: how can psychological identification with a world state be achieved?; how can German forfeiting of freedom through overemphasis upon general abstract concepts be remedied educationally?; how should an unrealistic pacifist reaction after the war, which turns away from the basic problems, be met?; to what extent could church groups within Germany assist in re-education after the war?

Finally, the fundamental question concerning the basis of war in human nature received renewed study. In 1943 Mark May summarized the work of the Yale Institute of Human Relations on this problem in *A Social Psychology of War and Peace*. This volume denies that war is the inevitable outcome of human nature. It holds that though aggressive tendencies are unavoidable due to the frustrations in the socialization process and in social interaction, nevertheless it has been possible to control overt conflict within the in-group. Hence aggression is possible to control between groups. The only assured way to prevent armed conflict, however, would be to extend the boundaries of the peace group to include all nations, that is, to build an international order.

In addition to war-oriented research, steady psychological advances continued during 1943 in the study of the physiological basis of behaviour, of learning and motivation, and of social functions. Extirpation experiments established the independence of the optic cortex and the superior colliculi in the mediation of visual functions. The cerebral mechanisms of vision furnish the basis for focal pattern vision; the lower centers are the basis for pattern vision of moving contours as well as brightness discrimination and flicker vision. In the field of learning the hypothesis that anticipatory goal reactions are symbolic processes of a higher level than the goal gradient was strengthened by the removal of the prefrontal cortical areas in rats with a resulting persistence of the goal gradient and the disappearance of the anticipatory reaction. Unusual results were reported in experiments on incidental memory with an *intent* group showing no better scores after a 19-day interval than a *non-intent* group. A genuine contribution to the dynamics of attitude formation appeared in T. Newcomb's *Personality and Social Change*, a study of the personal basis of attitude change in a college community. The role and status of the individual in the group proved a central factor in attitude change. The extension of controlled psychological techniques in field situations was demonstrated by a study of Italian acculturation by I. Child. (*See* also NERVOUS SYSTEM).

Public Health Engineering.

Air Sanitation.—In 1943, the reality of air-borne infection appeared to have become rather generally accepted among sanitarians. Accumulating evidence had shown that, beyond the range of "droplet infection"—direct contact with droplets resulting from coughing and sneezing—there is air carriage of bacteria resulting from the evaporation of the smaller droplets to dry nuclei. These may float for hours or days and be carried over considerable distances.

Once in this suspended form, the fate of the bacteria is determined by their own ability to withstand the adverse conditions of desiccation and of sunlight, direct or diffused. It is known on good experimental evidence that many of the pathogens of the nose and throat will survive under these conditions, either as free floating particles or as deposited dust for a sufficient length of time. The subject was well summarized up to 1942 by Leon Buchbinder.

Recognition of these facts led to extensive investigation upon both sides of the Atlantic into methods of air disinfection. Most of these studies, during the war years, were conducted under governmental auspices, British and American, and the results were utilized in connection with military and civilian activities on the war front and little publicity was given to the newer developments.

Improvements were made in the use of aerosols, vapours or mists of disinfectant sprayed into the room. Ultraviolet light was also applied in large-scale experimental work. These studies were expected undoubtedly to have an important bearing upon public health practice in the postwar years.

Water Supply.—For some years previous to 1943, there had been a gradual accumulation of evidence that contaminated drinking water might be a means of communicating poliomyelitis. Briefly, this evidence was as follows:

1. The gastrointestinal tract is a possible portal of entry to the human body. The older views had held that the sole portal entry is the nasopharynx and the olfactory nerves.
2. Active virus is recoverable from stools of patients and from city sewage.
3. The virus lives in sewage for a considerable time and in pure water for at least 100 days.
4. Ordinary processes of water purification do not destroy the virus completely.
5. In many cases of epidemics, the chronological distribution among cities in a river valley has followed the river downstream.

Up to 1943, it had not been generally believed that public water supplies were implicated in any of the major epidemics of this disease, but the possible responsibility of contaminated water —as well as milk and other foods—for occasional sporadic cases could not be eliminated. A considerable anxiety was felt among those responsible for water and sewage treatment as was evidenced by several scientific studies dealing with the effects of the various standard processes employed upon the virus. These studies were summarized up to 1943 by H. J. Carlson, *et al.*

City Planning.—Among the several lines of postwar planning undertaken up to 1943, none had greater public health implications than the planning for new housing construction and for city and town development.

Harland Bartholomew, engineer of the City Planning commission of St. Louis, Mo., summarized the opportunities and the needs that might be expected to develop as the result of housing shortage and need for speedy re-employment of men released from war activities, military and civil.

There are three levels of planning: the city as a whole, the neighbourhood, and the individual home. Zoning, with reference to more orderly development, open spaces and recreational centres deals with the community as a whole. It segregates industry, provides purer air in residential areas and reduces congestion. Neighbourhood planning results in decreasing traffic hazards, convenient access to shops, schools and playgrounds and elimination of slums. Housing deals with the internal arrangements of the household, especially such details as living space, sanitary facilities, light and air.

Public Utilities.

In 1943 performance by the public utility industry of the United States was dominated as in 1942 by war influences. Early in the year the War Production board reorganized its organization for wartime public utility control when J. A. Krug assumed his new duties as wartime administrator of utility services. With the placing of local electric railway and motor bus services under the control of the Office of Defense Transportation by executive order, the merging of the control of all nontransport utilities under the new WPB set-up simplified the dual system of regulation under the war powers and of regulation under the police powers. The courts were also upholding the power of the OPA under federal anti-inflation legislation to prevent increases in the rates of common carrier and other public utilities after Sept. 15, 1942, by federal, state or municipal authority without 30 days' notice to OPA and opportunity to intervene.

The most significant influence of OPA on public utility regulation was shown by the reduction in freight rates ordered by the Interstate Commerce commission in April. This reduction removed increases of 6% which the commission had granted early in 1942. In carrying out the purposes of the stabilization act of Oct. 1942, the commission found that the passenger rate advances of 10% did not need to be disturbed and that despite the freight rate decreases the resulting service revenues would be sufficient to meet all costs. Similarly, the OPA was attempting to prevent increases in other public utility prices, especially those which flowed automatically from contractual or technical requirements like the various types of fuel clauses. In spite of this influence, rate increases were granted when it became necessary to provide increased revenues in order to keep up good service.

Coming to a head in 1943, though announced on Jan. 3, 1944, the decision of the U.S. supreme court in the case of the Hope Natural Gas company against the Federal Power commission reaffirmed the position it had already taken in the Natural Pipeline cases. The conflict between the reproduction cost theory and the prudent investment theory of rate-base determination was, if anything, even more pronounced in this case because the circuit court of appeals had set aside the rate reduction order of the FPC because it was not based on reproduction cost. It was now generally agreed that the decision would further serve to support the FPC and any other federal and state commissions which proposed to regulate rates on a prudent investment basis. It should also support the FPC in its work continued throughout 1943, relating to reclassification of fixed capital accounts and in its original-cost studies, with the view of eliminating "write-ups" in these plant accounts.

Expansion in the jurisdiction of the FPC was likewise upheld by a U.S. supreme court ruling in the Jersey Central Power and Light company case. Here the court expanded its definition of interstate commerce by using the potential sale of breakdown power across state lines as the basis for extending the commission's jurisdiction to intrastate utilities connected with companies having interstate tie-lines.

The year was also memorable because for the first time the electric energy output of the United States, under the influence of war production, reached and passed the 200,000,000,000 kw.hr. mark. With 221,000,000,000 kw.hr. generated by means of an installed capacity of slightly less than 50,000,000 kw., the nation's producing power reached a peak from which it is more than likely that the future must show a recession. It was also important to note that the upsurge in the supply of publicly owned generating facilities reached about 20% of the national total, with hydro power more than holding its own with the expanding steam power. It was the federal portion of the public supply which had been expanding, particularly in hydro facilities. The tenth and last unit was installed at Bonneville in December, bringing that project's capacity to its ultimate of 516,400 kw. at a cost of $81,000,000. Private enterprise also set a new mark with the installation in the Fisk generating station at Chicago of a record breaking steam turbine of 147,000 kw.

A major problem of postwar adjustment was expected to come when administrative arrangements were worked out to co-ordinate public supply with private supply of power. The bureau of reclamation was decentralized into six area components. Contracts providing for the sale of power from Reclamation's Shasta dam to Pacific Gas & Electric company were signed. A Southwestern Power administration was established to sell power from Norfork, Pensacola and Denison dams. And in the background the Securities and Exchange commission was continuing its work of supervising the corporate simplification of holding company systems and their dissolution into newly integrated operating units.

In March the Federal Communications commission granted final authorizations for the Bell Telephone Company of Pennsylvania to acquire the Keystone Telephone system of Philadelphia and for the New Jersey Bell Telephone company to acquire the Eastern Telephone and Telegraph company and the Camden and Atlantic Telephone company. Of similar import is congressional legislation, now signed by the president, which authorized the merging of the Western Union and Postal Telegraph systems, plans for which were worked out and approved by the FCC during the year. Publishing (Book).

In a year in which fewer titles were issued in all but five of the classifications into which U.S. books are divided, books on philosophy and ethics showed the only substantial numerical increase, with 131 more books published in this classification in 1943 than in 1942. The number of books on technical and military subjects, the category which in 1942 registered the only sizable numerical gain over the preceding year, declined nearly 14% in 1943, although total sales remained large. Books of poetry and drama suffered the greatest numerical decrease, but marked decreases also occurred in the classifications of fiction, children's books and, unexpectedly in a war year, history, geography and travel. The year's total of new books and new editions was only 8,325—1,200 fewer than in 1942 and 2,787 fewer than in 1941. Table I, compiled by *Publishers' Weekly*, summarizes U.S. book publication for 1942 and 1943.

Best Sellers.—The year 1943's two fiction best sellers, Lloyd C. Douglas' *The Robe* and Marcia Davenport's *The Valley of Decision*, were both published in Oct. 1942, and remained on the best seller list throughout 1943. In third place was *So Little Time*, by John P. Marquand, followed by *A Tree Grows in Brooklyn*, by Betty Smith, *The Human Comedy*, by

William Saroyan, and *Mrs Parkington*, by Louis Bromfield. *The Song of Bernadette*, by Franz Werfel, 1942's fiction best seller, was in tenth place in 1943. *One World*, by Wendell L. Willkie was the nonfiction leader in 1943, with John Roy Carlson's exposé of fascist activities in the U.S., *Under Cover*, in second place. *Journey Among Warriors*, by Eve Curie, *On Being a Real Person*, by Harry Emerson Fosdick, *Guadalcanal Diary*, by Richard Tregaskis, and *Burma Surgeon*, by Lt. Col. Gordon Seagrave, followed. Marion Hargrove's 1942 nonfiction best seller, *See Here, Private Hargrove*, remained, like Werfel's book, on the 1943 list in tenth place. Although no figures were released on sales of individual books, *Publishers' Weekly* stated that a substantially larger number of copies of the 20 best sellers of 1943 had been sold than of the 20 best sellers of 1942.

Great Britain.—1943 was the sixth consecutive year in which the number of books published in Great Britain fell below that of the preceding year. The 6,705 titles issued in 1943 represented a decrease of 536 from the 1942 figure as well as a total smaller by several hundred than the expected publication figure of 7,000 books. However, three classifications showed numerical increases over 1942, and works on aeronautics, on naval and military subjects and on veterinary science, farming and stockkeeping appeared in greater numbers during 1943 than in prewar years. Of

1943's production, 1,201 titles were reprints and new editions and 5,504 were new books. Table II, compiled by the publishers of *The Bookseller*, gives detailed statistics of British book production for 1941–43. (*See* also NEWSPAPERS AND MAGAZINES; AMERICAN LITERATURE; ENGLISH LITERATURE; etc.)

Puerto Rico. A United States insular dependency in the West Indies; area, 3,400.6 sq.mi.; pop. (1940): 1,869,255, a 21.1% increase over 1930. Whites comprised 76.2%, Negroes, 23.8%. The chief cities are San Juan, the capital (169,247); Ponce (65,182); Mayagüez (50,376); Caguas (24,377); Arecibo (22,134); Río Piedras (19,935). Languages: Spanish and English; religion: predominantly Roman Catholic. Governor in 1943: Rexford Guy Tugwell.

History.—The year 1943 was one of considerable strain, economically and politically, for Puerto Rico. Depredations by axis submarines and dislocations of normal sources of supplies and food through wartime restrictions and operations brought about great shortages; agricultural crops were lighter than in the two previous years; military installations were largely completed, thus throwing unemployed labour onto the market; and the colonial government itself was called into question. Both in the United States and in the island pressure was increased for autonomy or independence.

An investigating committee headed by Senator Dennis Chavez (Dem., N.M.) arrived in Puerto Rico from the United States in Feb. 1943, to hold an enquiry into social, economic and political conditions. Governor Rexford Guy Tugwell was called upon to make a general report on affairs in the island. In his comprehensive report, Tugwell strongly endorsed the policy of granting autonomy to Puerto Rico, especially in regard to the election of governor. This point became one of the principal recommendations of the Chavez committee.

In March, President Roosevelt requested congress to amend the organic act to permit the people of Puerto Rico to elect their own governor, and appointed a special advisory committee composed of Puerto Ricans and continental residents to study the matter. The committee was headed by Secretary of the Interior Harold L. Ickes. Senator Millard Tydings (Dem., Md.), however, pressed for complete independence for the island, except that military bases would be retained by the United States.

A matter of great concern to the Puerto Ricans came with a threat of suspension of the FWA work relief program. Although some reduction in the total rolls was effected, a means was found to prepare an insular work program to assume full responsibility for emergency work relief. Rapidly rising prices, aggravated scarcities, and the completion of military construction made a reduction in work relief a serious problem for the large low income groups, such as the landless "agregados."

Shortages of food and consumers goods, fortunately, were gradually alleviated after March 1943, through the successful campaign against the axis submarines and through an increased allocation of shipping to the island. Also, an extensive "victory garden" program helped somewhat to improve the food situation. However, the efforts of a Food Distribution administration were needed to avoid famine and suffering.

Lack of sufficient chemical fertilizer for the sugar cane and tobacco plantings, and a severe storm on Oct. 14, 1943, which damaged food crops, created many agricultural problems. However, these factors were compensated to a large degree by the extraordinary rise in the production and exportation of rum. By September, rum production had reached a peak of 944,164 gal. per month. Income from the tax on rum and general improvement in shipping caused the insular treasurer to estimate revenue for the 1943–44 fiscal year at $53,775,000—a possible surplus of more than $28,000,000.

Education.—In 1943, there were 1,939 public schools with an enrolment of 321,932. It was estimated that of the children ages 6–14, more than 400,000 were not attending school. There were 1,622 elementary, 92 rural vocational ("second unit"), 17 trade, 158 junior high, and 42 high schools. The University of Puerto Rico had almost 5,000 students in 1943.

Finance.—The monetary unit is the United States dollar. Private deposits in banks had more than doubled since 1940, reaching a total in Oct. 1943, of $99,800,000.

Trade and Communication.—During 1943, shipping restrictions were gradually relaxed until by September, imports had reached two-thirds of the 1940 average (imports in 1940 were valued at $107,030,482—93% from the United States). Export

shipping was only slightly below normal by the end of the fiscal year. Imports were principally of foodstuffs—rice, fish, meat, beans, corn, flour, and vegetable oils and fats; also imported were textiles and various manufactures. Export shipments were of sugar, rum (five times normal), tobacco, needlework and fruits.

Daily air service with the United States and Panamá continued. Internal communication was by railway (387 mi.) and by 1,487 mi. of main highway supplemented by local and military roads. Radio-telephone and cable service connected Puerto Rico with the United States and other countries. Also, there were six radio broadcasting stations and six newspapers.

Agriculture.—Agriculture is the principal economic pursuit. Most important products in 1943 were: sugar, 1,039,237 short tons; tobacco 8,200,000 lb.; coffee 17,541,500 lb.; cotton 3,200,000 lb.; pineapples 500,000 crates; coco-nuts 10,057,000 nuts; grapefruit and oranges (for local consumption). In 1940, there were 51,494 work and 112,585 other cattle, and 22,709 horses, mules and donkeys. There were approximately 1,200,000 ac. of tillable land.

Manufacturing.—Manufacturing is for domestic consumption except for rum production, needlework, sugar processing and cigar and cigarette making. (C. L. G.)

Pugilism: *see* BOXING.

Pulitzer Prizes. The Pulitzer prizes in journalism and letters were established by the late Joseph Pulitzer, founder of the school of journalism of Columbia university, and are awarded annually in the spring by the trustees of the university on the recommendations of an advisory board of the school. In 1943 all monetary awards were for $500 each; three travelling scholarships were granted to students and one scholarship worth $1,500 was granted an art student. The prize awards were: for a distinguished American novel, to Upton Sinclair for *Dragon's Teeth;* for a distinguished book on the history of the United States, to Esther Forbes for *Paul Revere and the World He Lived In;* for the best American biography, to Samuel Eliot Morison for *Christopher Columbus; Admiral of the Ocean Sea;* for a distinguished volume of verse, to Robert Frost for *A Witness Tree;* for an original American play, produced in New York, to Thornton Wilder for "The Skin of Our Teeth"; for a distinguished musical composition, to William Schuman for *Secular Cantata No. 2, A Free Song.* The awards in journalism were: for a meritorious public service by an American newspaper ($500 gold medal), to the Omaha *World Herald* for its original plan for the collection of scrap metal; for a distinguished example of reporting, to George Weller of the foreign staff of the Chicago *Daily News;* for distinguished articles of national or foreign correspondence, to Ira Wolfert, North American Newspaper Alliance, for three articles on the fifth battle of the Solomons and to Hanson W. Baldwin, New York *Times,* for articles on the South Pacific battle areas; for distinguished editorial writing, to Forrest W. Seymour of the Des Moines *Register and Tribune;* for a distinguished cartoon, to Jay N. Darling, of the New York *Herald Tribune;* and for a distinguished news photograph, to Frank Noel, of the Associated Press. (*See* also LITERARY PRIZES; THEATRE.) (H. HA.)

Purdue University. An institution of higher education at Lafayette, Ind., founded May 6, 1869, as the Indiana link in the chain of land-grant colleges and universities. Degrees in 1943 were offered in agriculture, home economics, pharmacy, science, physical education, education, and the following branches of engineering: civil, electrical, chemical and metallurgical, mechanical and aeronautical, public service and engineering law; trade and industrial education.

Like many other institutions of learning, Purdue in 1943 was geared to the U.S. war effort, with the school calendar changed from two semesters of 18 weeks and a summer term to three full terms of 16 weeks each, so that a student might graduate in two and two-thirds calendar years.

While the type of training offered in Purdue fitted definitely into the war program, there were in addition to the regularly enrolled student body in 1943 hundreds from the navy or army taking special courses. The normal civilian enrolment of about 7,000 continued to drop, but there were 1,250 in the navy V-12 training program; 800 in the naval electricians' school; 1,500 in the army's specialized training programs; 150 in training at the Purdue airport as navy flight instructors or in preliminary flight training; 42 South American fliers in training under the inter-American program, etc.

Research in agriculture and industry as well as the teaching and extension programs were also directed into the nation's war effort. For statistics on enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.

Pyrite. The production of pyrite in the United States rose from 722,688 short tons in 1941 to 806,807 in 1942; production increased by 12% and value of output by 23%. Output was reported to have increased again in 1943, but no details were available. Before the war, imports, chiefly from Spain, were almost as large as the domestic output, but Spanish shipments were cut by shortage of shipping, and imports from

Canada took their place. Canadian production, largely by-product from the concentration of copper ores, increased heavily. Australia could produce large tonnages of by-product pyrite from copper, lead and zinc ores, but the domestic demand is small and distance from other points of consumption plus shortage of shipping blocks the recovery of more than is required to meet the domestic consumption. Portugal for a time was a heavier producer than the United States, but here, too, lack of shipping curtailed operations. The Spanish output was irregular, between 33,000 and 66,000 short tons monthly; a total of 151,200 tons in the last quarter of 1942 declined to 116,600 tons in the first quarter of 1943. (G. A. Ro.)

Quakers: *see* FRIENDS, RELIGIOUS SOCIETY OF.

Quebec. One of the two central provinces of the dominion of Canada (*q.v.*), admitted to the union in 1867; area 594,534 sq.mi.; pop. (1941) 3,331,882, of whom 65% were urban. Capital, Quebec (147,908); largest city, Montreal (890,234). The lieutenant governor in 1943 was Eugene Fiset; the premier, Adelard Godbout.

Education.—The number of students in provincially controlled schools in 1942 was 610,792; in private schools 57,593.

Communication.—The mileage of surfaced highways in 1942 was 19,250; of earth highways 18,918; provincial expenditure on highways $21,389,804. The railroad mileage in 1942 was 4,804.

Finance.—The ordinary receipts in 1942 were $59,153,857; ordinary expenditure $66,441,201. The direct debt (less sinking funds) was $387,747,347, indirect liabilities (less sinking funds) $38,554,517.

Agriculture.—The acreage of field crops in 1943 was 6,599,900; gross value of all field crops $153,152,000.

Table I.—*Leading Agricultural Products of Quebec, 1942 and 1941*

Crop	1942	1941
Wheat, bu.	603,000	533,000
Oats, bu.	50,580,000	47,291,000
Barley, bu.	3,881,000	3,715,000
Corn, bu.	904,000	695,000

Manufacturing.—The gross value of manufactured products in 1940 was $1,357,375,776; net value $595,552,909; number of employees 252,492; salaries and wages $277,639,876.

Table II.—*Principal Industries of Quebec, 1939 and 1938*

Industry	Value of products	
	1939	1938
Pulp and paper	$103,564,981	$88,900,115

Asbestos, etc.	16,931,476	15,858,492

*1942. †1941. (J. C. HE.)

Queensland. A state of the Australian commonwealth lying in the northeast and occupying 670,500 sq.mi.; pop. (est. Dec. 31, 1941) 1,036,830. Chief cities (pop. Dec. 31, 1940): Brisbane, cap., 335,000; Rockhampton 35,500; Townsville 31,450. Governor (1943): Sir Leslie Orme Wilson.

History.—The Labour government under the premiership of F. A. Cooper remained in office throughout 1943. The state smeltery at Chillagoe—the last of the state enterprises established during World War I—was closed in July. Legal history was made in March when a jury of seven was empanelled in criminal proceedings in Brisbane. This followed special legislation passed to permit smaller juries consequent on the manpower shortage. Sugar production during 1943 was estimated at 607,000 tons, the lowest for several years. The year's cotton crop was also expected to be lower owing to unfavourable weather conditions.

The postwar reconstruction committee submitted plans to the state government for extending the state's irrigation and water conservation resources involving a capital outlay of £A14,000,000 to £A15,000,000.

Education.—In 1940: schools, 1,914; scholars, 171,391.

Finance.—Revenue (1941–42) £A23,662,947; expenditure (1941–42) £A23,599,175. Debt outstanding (June 30, 1942) £A131,171,752.

Communication.—Roads (1940) 125,095 mi.; railways (Dec. 31, 1942) 6,497 mi. Motor vehicles licensed (March 31, 1943), 63,948 cars; 44,756 commercial; 5,378 cycles. Wireless receiving set licences 176,947. Telephones, 85,847.

Agriculture, Manufacturing, Mineral Production.—Production in 1941–42: sugar cane 800,000 tons; wheat 3,000,000 bu.; maize 3,733,424 bu.; wool 194,200,000 lb.; gold (1939) 145,667 fine oz.; silver (1939) 3,600,000 oz.; coal (1942) 1,708,000 tons. Industry, manufacturing, 1940–41: factories 2,972; employees (average) 57,269; production, gross value of output £A70,236,464; unemployment (trade union returns) (March 1943), 1.5%. (W. D. MA.)

Quicksilver: *see* MERCURY.

Race Riots. When the Alabama Dry Dock and Shipbuilding company of Mobile promoted 12 Negro workers May 25, 1943, the white workers objected. As the Negro workers left the plant they were attacked, and 11 of them were so badly injured that they had to be treated at a hospital. Order was not restored until a detachment of troops arrived.

Rioting began in Los Angeles, Calif., on June 4 when soldiers and sailors attacked Mexicans and Negroes who were wearing "zoot" suits; the rioting continued for six days, and the city council passed an ordinance forbidding the wearing of zoot suits, but on June 7, before the ordinance was passed, a mob of about a thousand service men and civilians raided a theatre and drove the Mexicans and Negroes into the street, where they were assaulted.

Rioting began in Beaumont, Tex., on June 19 when it was rumoured that a white woman had been assaulted by a Negro. Negroes were attacked whenever they appeared on the streets, and many hundred workers in the Pennsylvania company's shipyard went out and refused to return to their jobs until order was restored. Ten persons had to receive hospital treatment for the injuries received.

Rioting began in Detroit, Mich., on Sunday, June 20, with an attack on Negroes employed by the Packard company. Attracted by the high wages in the war industries, more than 300,000 whites and Negroes from the south had migrated to the city, taking with them the southern feeling about race relations. Early in June some Negroes employed by the Packard company had been promoted. Agitators charged with being members of the Ku Klux Klan incited the white southern workers to protest

against the promotion of the Negroes. Many Negro workers were unable to get to the plant on Monday because they were attacked by roving mobs composed chiefly of boys and young men. The mobs not only attacked the Negroes but also broke the show windows of stores and carried off the goods from the shelves. On Monday night eight Negroes were riding on a Woodward avenue car. A police inspector with eight patrolmen boarded the car and told the Negroes that a mob was coming toward it and that he would protect any Negro who wished to be guarded against mob violence. Four of the men left the car with the police, but when they reached the street they were beaten and generally abused. Mobs of from 800 to 1,000 roamed the streets attacking Negroes in their automobiles, overturning the cars and burning them. Thirty-five persons were killed during the trouble, 29 of whom were Negroes. More than 600 were injured, most of them Negroes and 85% of the 1,832 persons arrested were also Negroes.

On Sunday, Aug. 1, according to New York city police, a Negro army M.P. interfered with a policeman who attempted to arrest a woman in the lobby of a hotel in the Harlem district. The policeman shot and slightly wounded the Negro. It was at once rumoured that a policeman had killed a Negro soldier, and rioting began with attacks upon Negroes. During the trouble five Negroes were killed and 561 persons, many of them Negroes, were injured. (G. W. Do.)

Rachmaninoff, Sergei Vassilievitch (1873 - 1943), U.S. pianist, composer and conductor, was born April 2, on his father's estate, Oneg, in the Novgorod district, Russia. He made his home in the United States after World War I, and though he appeared as conductor on several occasions, his popularity rested on his mastery of the piano and on his compositions. His works, ranked among the most important 20th century compositions, were described as purely "Russian" and as typical of the Slav folk spirit. Most popular of his compositions, a prelude in C sharp minor, was written when he was only 20 years old. He became a naturalized U.S. citizen, Feb. 1, 1943. An attack of pneumonia and pleurisy cut short his last concert tour and he died at his home in Beverly Hills, Calif., March 28. (See *Encyclopædia Britannica.*)

Radio. **Industrial Developments.**—Civilian radio manufacture in the U.S. was at a virtual standstill during 1943, with no new radio receiving sets or transmitters of any character produced for other than wartime use. But a tremendous new radio-electronics industry was established, with military production reaching the total of $250,000,000 a month during 1943 as against $30,000,000 a month a year before.

The total number of radio receiving sets at the end of 1943 was 57,000,000, a decline of some 2,300,000 as compared with the preceding year. But the number of radio homes increased from an estimated 30,800,000 in 1942 to 32,500,000 in 1943, reaching an all-time high. The decline in sets in use was attributed to multiple sets in the same home out of working order because of shortages in replacement tubes and batteries (primarily on farm or non-electrified areas).

With 32,500,000 of the nation's 35,000,000 homes radio-equipped, according to a survey made by the Office of Civilian Requirements in Dec. 1943, roughly nine out of each ten families had radio service. OCR also estimated in Dec. 1943 that 8.5% of receiving sets were out-of-order. Scheduling of production for tubes and parts, ordered by WPB in December for the first two quarters of 1944, was expected to restore large numbers of out-of-order sets to operation.

The total investment in the radio manufacturing industry as of Jan. 1, 1944 (devoted 100% to military, lend-lease and other wartime production) was placed at $350,000,000. Annual gross revenue was estimated to be $3,500,000,000. The total number of employees was 400,000, with an estimated annual payroll of $900,000,000.

Radio distributors, dealers and other establishments had a total investment at the end of 1943 of $280,000,000, with annual gross revenues of $200,000,000. They employed approximately 100,000 people, with an annual payroll of $150,000,000.

Because of wartime restrictions, no data was available at the year-end on exports of receivers to Latin American countries for civilian use. In 1942, consistent with the government's hemispheric solidarity program, about 2,500,000 sets were delivered to countries in Latin America, increasing the total number of receivers in those countries to an estimated 6,000,000. Another 3,000,000–5,000,000 sets, standardized export models capable of short-wave reception, probably were delivered to these nations during 1943.

On Jan. 1, 1944, in the United States there were 912 standard broadcast stations licensed and in operation. This compared with 917 a year before. Several stations, unable to operate because of wartime restrictions and lack of manpower, turned in their licences.

The "freeze" on construction of new stations, which became effective on April 27, 1942, continued in force during 1943. While several new stations were licensed, these were in areas considered underserved from the military standpoint. Similarly, improved facilities were authorized where a minimum of critical material was needed, to provide necessary coverage in underserved areas.

Wartime restrictions also prevented further development of television and frequency modulation (FM) broadcasting during the year. Operations on a quasi-experimental basis, however, continued, with these new services poised to expand as soon as restrictions were lifted. Large scale plans for postwar allocations in all radio fields envisaged some 3,000 FM stations and 1,000 television stations a decade following cessation of hostilities.

There were 42 commercial FM stations licensed as of Jan. 1, 1944, while seven other companies held construction permits to build such stations as soon as equipment becomes available. There were five commercial television stations authorized, while three construction permits were outstanding. In addition, 21 companies held experimental television licences while six others had construction permits. International shortwave stations in operation, with the government underwriting the programming for propaganda purposes, totalled 18 at the end of 1943. Seven other stations, however, were under construction.

As in years past, radio's chief sources of advertising revenue were foods, drugs (including soaps and similar housekeepers' supplies) and tobacco. These commodities represented about three-fourths of the total income of the national networks. The broadcasting industry continued its steady growth during 1943, with the "sold out" sign for desirable daytime and evening hours displayed by practically all metropolitan area stations and the networks.

National and regional advertisers, still limited as to production in most cases, continued their campaigns largely along institutional or "brand name" lines. They sought to maintain public prestige and to preserve continuity of their choice program time on the national networks, looking to the war's end. Many large manufacturing concerns, engaged in wartime production, began use of radio for institutional purposes. Moreover, rationing of paper for newspapers and magazines resulted in some "windfall"

business for radio.

Throughout 1943, broadcasters found themselves at grips with the Federal Communications commission and with labour unions. Primary activity, however, was in congress, where the senate interstate commerce committee, in Dec. 1942, completed hearings on proposed new radio legislation, to spell out the powers of the FCC. The house select committee to investigate the FCC, created in Jan. 1943, held hearings during the year, and charged the commission with exceeding its powers.

War effort programs were the rule during 1943. Estfmates of the Office of War Information made in November were that time valued at $103,000,000 had been donated by the industry for government programs.

For the first time in history, a major network changed hands. In October, Radio Corporation of America sold the Blue Network to Edward J. Noble, chairman of the Life Savers Corp., for $8,000,000 cash. In December, *Time Magazine* purchased a 12½% interest in the Blue Network Co. Chester J. LaRoche, advertising agency executive, also purchased a 12½% interest in the network.

Revenue and Finance.—During 1942 (1943 figures were not available) the broadcasting industry maintained its consistent pace of increasing business from year to year, with an increase of approximately 6.1% over the 1941 figure. This was slightly less than half the rate of increase during 1941 over the preceding year. Rough industry estimates for 1943 indicated net time sales of $215,000,000 as against $191,000,000 in 1942. There were no accurate figures on talent sales but they run between $40,000,000 and $45,000,000 annually.

Table I.—*Radio Advertising Revenue, 1942 and 1941*

	1942	1941
Major and regional network advertising revenue	$89,500,000	$82,373,607
National "spot" advertising*	49,500,000	45,681,959
Local advertising†	52,000,000	51,697,651
Total	$191,000,000	$179,753,217

*Advertising by nationwide distributors placed over individual stations (as opposed to chain, or network, advertising).
†Advertising placed by local advertisers over the individual stations in their market areas.

Before all discounts, the advertising revenue of the industry was divided, as shown in Table I.

The Federal Communications commission, which from 1938 on produced annual compilations of radio business and expenses, did not develop complete data for 1942 by the close of 1943, because of restrictions on government statistical production and of the manpower shortages. The detailed data was expected to be available sometime in 1944, covering the 1942 calendar year.

The industry's 1942 balance sheet, as produced in preliminary form by the FCC, varied slightly from the industry estimates, though the overall totals are approximately the same. The balance sheet is shown in Table II.

Table II.—*Revenue and Expenses of Radio Industry in 1942*

	1942	Pct. change over 1941
Station revenue:		
Sale of time to major and regional chains	$34,419,071	+ 7.2
Sale of time to national spot advertisers	51,059,159	+13.2
Sale of time to local advertisers	53,898,916	+ 4.2
Total sale of station time	$139,377,146	+ 7.6
Network revenue:		
Revenue retained after paying affiliated stations	$50,769,906	+ 4.4
Total industry time sales	$190,147,052	+ 6.7
Deduct commission to advertising agencies	26,504,107	+ 8.2
Total industry net time sales	$163,642,945	+ 6.5
Incidental revenue	15,196,554	—
Total net industry revenues	$178,839,499	+ 5.9
Expenses:		
Total deductions	$134,207,261	+ 8.3
Broadcast Service Income (Total Revenue in Excess of Expenses before Taxes)	$44,632,238	− .4

The figures in Table II are based on returns received by the FCC from 819 stations, the national and regional networks, including nine key stations of the major networks, and 23 managed and operated stations. They are not projected to cover the entire roster of 912 stations, leaving 61 stations which failed to file reports out of the compilation.

The FCC analysis shows the trend in increased radio overhead. While total broadcast revenues increased from approximately $168,779,000 in 1941 to nearly $179,000,000 in 1942, expenses jumped from $124,000,000 to $134,000,000. Thus, the total broadcast service income, before federal taxes, remained relatively the same—$44,839,000 in 1941 as against $44,632,000 in 1942. But the higher tax rates were expected to diminish appreciably net profits after taxes.

Trade estimates of gross billings, which are projected from one-time rates of stations and networks, showed gross billings for 1942 of $254,800,000 as against $237,600,000 in 1941. Gross billings for 1943 were estimated at $280,000,000. Of the 1942 estimated gross billings, $121,500,000 was assigned to major and regional networks; $69,500,000 to national spot and $63,800,000 to local advertising.

Radio was the only medium to come through the first year of the war comparatively unscathed with regard to its economic position. All other media had experienced losses. But during 1943, all media showed significant increases, with many newspapers and national magazines forced to "ration" space. Because

of the "sold out" status of leading station and desirable network time, radio also was in the position of picking and choosing accounts during 1943.

Profit.—No profit figures were available for 1943, because of the delay entailed in FCC production of this data. In 1942 an excess of revenues over expenses of $44,632,238 was reported. In 1941, the excess of revenue over expenses totalled $33,438,118. This was an average of $42,650 per station.

The economic structure of radio generally was regarded as improved during 1943 as compared with the preceding year. A number of small stations, regarded as "chronic losers" still were in that category during the year. But aggregate losses were not expected to exceed $500,000 for the some 150 stations usually in this category, or about $3,000 per station.

Industry Assets.—The tangible property of the entire broadcasting industry in 1942 and 1943 remained relatively unchanged, in view of the WPB-FCC freeze order on new construction.

The tangible property of the broadcasting industry as shown in 1941 had a composition as shown in Table III.

Table III.—Composition of Tangible Property of Radio Industry in 1941

	817 stations	Major networks	Regional networks	Total
Original cost	$67,017,706	$9,934,697	$121,060	$77,074,363
Depreciated cost	39,416,993	5,596,815	97,189	45,110,997

Programming.—*Network Commercial Programs.*—The ten most popular network programs as of Dec. 1 were[1]:

1943	*1942*
1. Fibber McGee & Molly	1. Chase & Sanborn Program (Edgar Bergen)
2. Bob Hope	2. Fibber McGee & Molly
3. Lux Radio Theatre	3. Jack Benny
4. Chase & Sanborn Program (Edgar Bergen)	4. Bob Hope
5. Kraft Music Hall	5. Kraft Music Hall
6. Red Skelton	6. Lux Radio Theatre
7. Sealtest Village Store	7. Red Skelton
8. Maxwell House Coffee Time	8. Maxwell House Coffee Time
9. Aldrich Family	9. Aldrich Family
10. Kay Kyser Hit Parade	10. Kay Kyser

There was further emphasis on war programming during 1943. In addition to the contributed sustaining time valued at more than $100,000,000 for government programs, many commercial programs took on a war-public service connotation. All programs in the war effort category were cleared through the Office of War Information, radio branch. A regular weekly schedule of campaigns to be emphasized on the air, broken down as to networks and various groups of affiliated stations, was inaugurated during the year.

An increase in international pickups, with broadcasts direct from the headquarters of war theatres, also was evident during the year in news and special events coverage. All networks increased war news staffs.

One innovation was the wire recorder, a compact instrument using a magnetized wire for recording and reproduction, which was dispatched to the fighting fronts through the war department's radio branch. Several programs, employing actual pickups from the fighting lines, were broadcast during the year in this new phase of "documentary" radio reporting.

The perennial controversy over so-called "soap operas," serial strips continued during 1943. There developed, also, a heated discussion over "editorializing" on the air by commentators and analysts who express personal opinions. The controversy resounded from congress to the FCC and throughout the networks. While no hard and fast rules developed, it was generally agreed that freedom of expression on the air should be retained as synonymous with press freedom, but that commentaries should be labelled for what they are—editorial, analysis or straight news reporting.

Network Programs by Types.—The general composition of network evening programming, based on latest available information, appears in Table IV.

Table IV.—General Composition of Network Evening Programs

Type of program	1943 % of time on the air	1942 % of time on the air
Drama, serial drama	27.0	31.4
Audience participation	14.3	14.5
Variety	18.1	22.6
Commentators, news and talks	18.6	10.9
Popular music	12.6	12.6
Familiar music	5.8	5.2
Classical, semiclassical music	2.0	2.8
Children's programs	.7	(No record)

Data supplied by the Co-operative Analysis of Broadcasting.
Note: Each program type has been allotted the number of hours which all programs in that type represent. The chart is based on the table of program types. 15-minute programs broadcast 5 times a week have been considered as 1¼ hours per week for the number of weeks investigated, 15-minute programs 3 times a week ¾ hour, etc.

Talent Costs.—Accurate data was not computed covering aggregate talent costs of network commercial programs. Trade estimates, however, covering the 1942–43 period were in the neighbourhood of $40,000,000 for nighttime programs and $8,000,000 for daytime programs. Costs generally increased by virtue of widespread introduction of union scales for performers and announcers, not only in key operating cities but in virtually all metropolitan areas.

Individual Station Programming.—The most decided trend in individual station programming during the year revolved around the war. Many stations adopted variations of "home front" features, based on reports of local fighting men overseas or in training camps. These supplemented network pickups of the same broad character. With rationing of food products, gasoline and other items, stations also built regular features covering point rationing. Sponsors were found readily available for such features in local areas.

Looking toward the war's end, stations generally put on drives for local retail advertising. Department stores spend the bulk of their budgets in newspapers. Under the auspices of the National Association of Broadcasters, a nationwide tour was made in the fall and winter of 1943, covering 120 cities, to exhibit the motion picture production "Air Force and the Retailer."

News programming settled down during 1943. In 1942 Associated Press, through its subsidiary PA, entered the field and there was lively competition for station clients. United Press, International News Service and Transradio Press, pioneers in radio news distribution, broadened their operations also, with a general speeding up of news service to individual stations and networks. Many stations supplemented their national news coverage through creation of local reportorial staffs. Several larger stations and all of the networks maintained full-time correspondents or bureaus in Washington.

Programs During the War.—When war came in Dec. 1941, broadcasters were fearful of the effect of government censorship, particularly since radio had never gone through a war. The reverse was true. Only scattered incidents involving censorship developed. "Man In the Street" broadcasts and certain types of audience participation shows had to be discontinued or modified. But voluntary censorship worked so well that a revised code of wartime practices for broadcasters was issued Dec. 10, 1943, lifting many of the former restrictions. Weather broadcasts, banned from the war's outbreak, were restored in the fall.

Despite out-of-order sets, as a result of wartime conditions, official estimates indicated that the radio audience continued to

[1]These ratings are supplied through the courtesy of A. W. Lehman, manager of the Co-operative Analysis of Broadcasting, and are copyrighted by the latter. The CAB is the industry's major fact-finding body in the field of programming.

increase during 1943. Approximately 32,500,000 American families, or 89% of the total, had one or more radio sets in use, according to a survey made by the Office of Civilian Requirements in Dec. 1943. President Roosevelt continued as the nation's leading radio personality, with his addresses reaching from some 45% to 75% of the radio audience. On several occasions in 1942, his audience reached 83%, a figure he did not eclipse in 1943, as far as the records go.

The average daytime audience for network programs, whether of the serial (soap opera) or non-serial type, reached an all-time high during 1943, according to a year-end review released in December by C. E. Hooper Inc., radio research organization. The average daytime audience was more than 6% larger, in the last quarter of 1943 than for the corresponding period of 1942.

Although the volume of daytime serial dramas had held constant at about 50 hours per week for 16 months, there developed a rapid rise in the volume of non-serial programs from 6½ hours during week days in January to the Dec. 1943 figure of 22¾ hours weekly.

Radio v. Government.—*The Network "Monopoly" Case.*—On May 10, 1943, the U.S. supreme court upheld the right of the FCC to regulate practically everything that is radio, by sustaining the jurisdiction of the commission to regulate contractual relations of the major networks with their affiliates. The effect of the supreme court's split decision was to sustain the commission's right to issue regulations preventing the networks from optioning more than a fixed percentage of the time of affiliated stations; to bar them from entering into exclusive contracts with affiliates and to prevent operation of more than one network by a single company.

The issue had been in litigation for a half dozen years. The supreme court opinion, however, went beyond the mere network regulations and appeared to give the commission authority to control general business practices of networks and stations and also inferred some degree of program control. The latter contention, however, was vigorously disputed by the FCC, and more particularly its chairman, James Lawrence Fly, who contended that broadcasters had plucked a phrase from the opinion out of context. This mooted phrase was "composition of that traffic" which broadcasters interpreted as giving the commission implied control over programs.

At hearings before the senate interstate commerce committee, which ran from Nov. 3 until Dec. 16, 1943, the broadcasting industry, through spokesmen for the National Association of Broadcasters, two of the networks and independent station groups, appealed to congress in effect to "repeal" the supreme court opinion and limit the FCC to control of physical aspects of radio.

Immediately upon completion of the hearings, the committee began executive sessions to draft new legislation to spell out the FCC's functions. Impressed by predictions made for the development of remarkable new services, such as FM, television and facsimile transmission by radio, the committee pondered the question of writing a series of simple amendments to the Communications Act of 1934, in lieu of an entirely new bill. An integrated act, covering radio's ultimate service, which would see voice transmission, motion pictures and an electronics printing process (facsimile) in the same cabinet, probably would await the peace.

As a direct result of the FCC's network regulations, RCA, which had operated both the NBC Red and Blue networks from 1926 and 1927 on, respectively, separated the two projects on Jan. 9, 1942 and divorced Blue operations from those of NBC. Subsequently, on Oct. 14, Edward J. Noble formally took over the Blue network and became its board chairman. He paid a cash figure of $8,000,000 for it. On Dec. 28, Mr. Noble announced sale of a 12½% interest each to Time Inc. and advertising executive LaRoche for $500,000 each, cash. Mark Woods, president, and Edgar Kobak, executive vice-president of the Blue Network Co., each acquired small stockholdings at the same time.

Following the supreme court action in the network cases, the department of justice dismissed anti-trust proceedings on practically the same issues filed against RCA, NBC and Columbia Broadcasting system on Dec. 31, 1941. Also dismissed by the federal district court in Chicago was a $19,000,000 triple damage suit against RCA-NBC filed by Mutual Broadcasting system, which claimed its growth had been impeded by RCA's operation of two networks.

Other FCC Investigations.—Faced with two separate investigations in congress during 1943—one before the senate interstate commerce committee and the other by the house select committee—the FCC dusted off a pair of old orders toward the end of the year which brought protests both from members of congress and from the industry. On Nov. 23, 1943 it resurrected a 2½-year-old order, banning multiple ownership of broadcast stations in the same area, affecting some 40 existing combination ownerships, or situations where there was overlapping service (*i.e.* the signals of one station overlap those of another owned by the same interests). The new order was made effective June 1, 1944. While no outright transactions had been completed at the year's end, negotiations were in progress for station sales or exchanges, to conform with the order.

There were projects for organized resistance, however, on the ground that the commission over the years had licensed these stations and renewed their licenses, finding that public interest thereby would be served. Owners contended that dual operation did not tend toward monopoly because competition existed with other stations in the same service areas in practically every case as well as with newspapers.

The second proposed regulation was that designed to ban newspaper ownership of broadcasting stations as tending toward monopoly in public opinion. Pressed by members of congress about its lethargy in deciding this issue, pending since March 1941, the commission, in the waning days of 1943 tentatively approved a policy allowing newspapers to own stations. Final action, however, did not crystallize as the year closed.

House Investigation.—When 1943 ended, the house select committee to investigate the FCC, created the preceding January, was still functioning. Originally given a $60,000 appropriation, the house authorized another $50,000 fund in November, to complete the inquiry. Originally headed by Rep. Eugene E. Cox (Dem., Ga.) the committee precipitated one of the most sanguinary fights in Washington political history in its attack upon the commission and more particularly its chairman, James Lawrence Fly. Rep. Cox resigned chairmanship of the committee in September and Rep. Clarence F. Lea (Dem., Calif.) was named his successor. The investigation was launched by the house, after Rep. Cox had levelled charges of incompetence, inefficiency and alleged wrong-doing against the FCC and more particularly its chairman.

Board of War Communications.—All wartime communications policy determinations, other than those directly affecting the military, were cleared through the Board of War Communications during 1943.

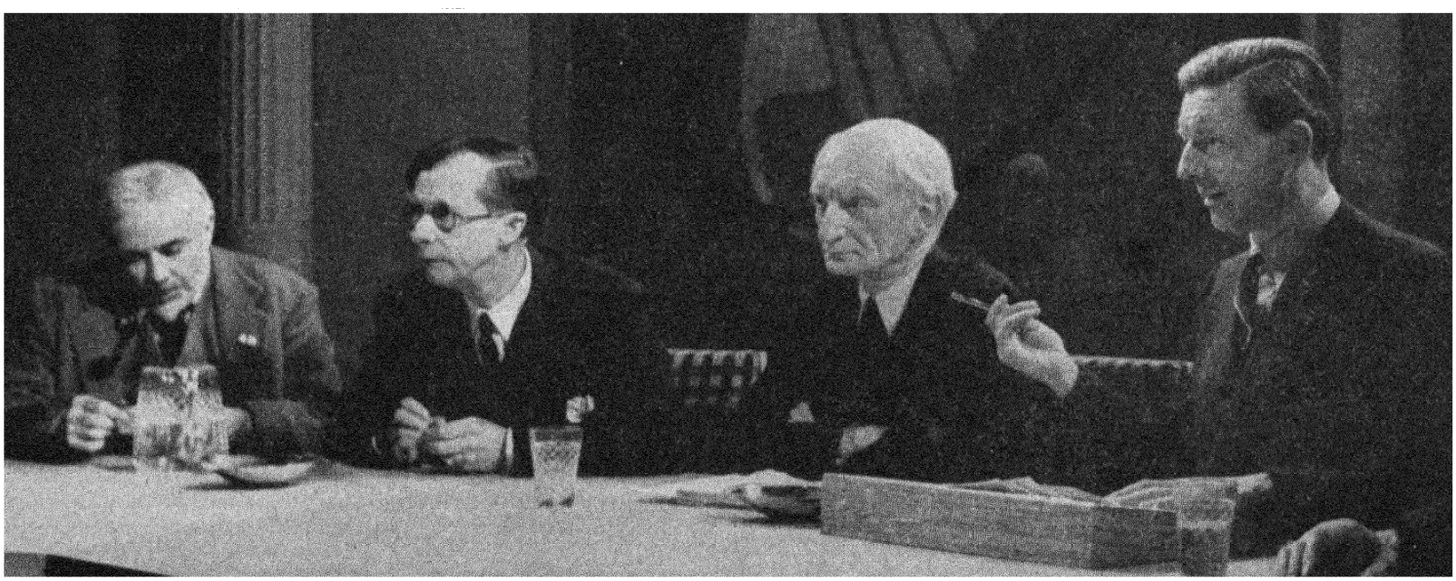
Practically all of the activities of the Board of War Communications were secret. During the year it issued a number of orders dealing with civil activities in all branches of communications. Restrictions placed upon the operations of broadcast stations to conserve materials were promulgated through this board and remained in force throughout the year. The ban on operations of amateur radio stations in the short waves was retained as a

national security measure.

Musical Property.—Broadcasters experienced no serious musical copyright troubles during 1943, perhaps for the first time since radio became a national service. Music troubles revolved around the dispute with the American Federation of Musicians (34,000 members) and at the year's end, more trouble appeared to be brewing. James C. Petrillo, president of the federation, on Aug. 1, 1942 similarly banned the making of transcriptions and phonograph records by union members, alleging unfair competition with live musicians. Despite a congressional inquiry and National War Labor board arbitration, this impasse, which broadcasters prefer to call a "strike," was not broken until Sept. 24 when Decca Records Inc. and World Broadcasting system agreed to the Petrillo demands for payment of royalties direct to the union for "unemployment relief." Subsequently, independently operated transcription and record companies agreed to somewhat similar terms and were authorized to resume recording. RCA, in behalf of its Victor Co. and the recording division of NBC, another subsidiary, and Columbia Recording Corp., subsidiary of Columbia Broadcasting system, refused to accept the Petrillo terms on the ground that a "private WPA" would be established.

Portents of a national strike of musicians performing for the radio networks was seen as the year ended. Contracts of the major networks with the federation were to expire Feb. 1, 1944. Petrillo had advised locals not to negotiate new contracts with network key stations, pending action by the transcription and record subsidiaries of RCA and Columbia Broadcasting system on the royalty demands. It was generally thought that if the recording ban was not reconciled by the date of expiration of union contracts, the federation might be disposed to withdraw all staff orchestras from network key stations.

Employment.—With average weekly compensation to its 25,515 full-time employees of $55.75, the broadcasting industry in 1943 maintained its standard of high compensation—a gain of 6.6% over the preceding year. While no comparable industry figures were available, it was stated semi-officially in Washington that this represented the highest average wages and salaries of any United States industry. The average weekly payroll (for the week of Oct. 17, 1943) totalled $1,366,687 for full-time employees. Excluding executives, the average per full-time employee was $49.50, or an increase of 7.3%. Station employees in executive capacities received the following average weekly salaries: general managers, $132.73; technical, $67.15; program, $67.29; commercial, $102.49; publicity, $65.32. In non-executive positions, station technical operating personnel averaged $48.53 per week; announcers, $45.76; staff musicians, $53.83; outside salesmen, $76.85; script writers, $37.60. Part-time employees totalled 4,862 average weekly and were primarily in the talent group. Network and network-owned stations paid this talent group of part-time employees $80.44 per week, while stations paid $30.25.



Television and Frequency Modulation.—The technical progress of these two arts is discussed below in *Scientific Developments* and in TELEVISION.

In Dec. 1941, it was estimated there were 500,000 FM receivers in use, and about 10,000 television receivers. During the year, nine U.S. television stations were broadcasting on regular schedule—three in New York, one in Schenectady, one in Philadelphia, two in Chicago and two in Hollywood. New television sets, it was generally predicted, would be available within six months after peace in Europe. The first models of sight and sound receivers probably would range from $200 to $700. One manufacturer said he would offer a $150 table model television set.

FM, providing a "staticless" type of transmission and reception which insures higher fidelity of reproduction, was expected to open up virtually unlimited competition in broadcasting after the war, according to its proponents. Under existing standards of allocation, 3,000 new FM sound broadcasting stations could be established. These would represent a capital investment of roughly $150,000. To launch FM with greatest possible expedition, two separate organizations were formed. One, FM Broadcasters Inc., was a trade association designed to encourage development of FM and to co-ordinate operations; the second, American Network Inc., proposed to create a nationwide network of FM stations to compete with the established AM (amplitude modulation) networks. FM receivers, it was predicted, would sell in about the same price range as regular receivers.

Radio in the Western Hemisphere.—Little or no change in the status of radio on the North American continent was effected during 1943, because of the frozen state of allocations. Most Latin American countries procured their radio equipment from manufacturers in the United States. This was so particularly after the beginning of World War II. Before then, Telefunken, German radio manufacturing and operating cartel, had important outlets in South and Central America.

The benefits of the North American Regional Broadcasting agreement, which became effective in March 1941, were fully realized in 1943. Because medium wave channels used for standard broadcasting (540 kc.-1600 kc.) have an interference range over the continent, scientific allocations to the various countries

THE BRITISH EQUIVALENT of "Information Please" in 1943 was a quiz program called "Any Questions?" Four of the program's stars, here shown left to right, were C. E. M. Joad, Julian Huxley, Sir William Beveridge and the master of ceremonies, Donald McCullough

in the hemisphere was necessary, along with uniform methods of operation.

World Conferences.—Need for an international radio conference and possibly a worldwide telecommunications conference immediately after the war was generally foreseen. In the postwar era, radio networks, both sound and television, might be extended internationally. Although it appeared fairly certain that such networks would not extend beyond the western hemisphere or even to South America for some time to come, the technical considerations should not be overlooked in planning domestic services, according to government engineers.

Much would be gained by allocating the same frequency bands to television on an international basis and also in adopting international standards for both program broadcasting and network relay systems (by short-wave radio). If such plans were not made, it might be impossible to set aside common bands of frequencies for maritime and air navigational aids, looking toward globe-girdling aviation service, wherein radio would serve both as its eyes and ears. Moreover, if different bands and technical standards were used in different regions of the world, problems respecting sale of apparatus and exchange of international programs might become well-nigh unsolvable.

Military Radio.—Smashing of barriers of distance, psychological as well as geographical, the army developed in 1943 the largest improvised network in the world to bring radio to American troops in all theatres of war. Every medium of radio, from 100,000-watt short-wave transmitters to the old acoustic spring-wound playback phonographs, was used by the armed forces service to bring soldiers, sailors and marines entertainment either direct or by recording. Thousands of hand-operated playback machines were sent to areas where no electricity was available and transcriptions of programs were supplied by transport plane for reproduction of these recorded programs.

In addition to broadcasting stations set up under military jurisdiction wherever feasible, short-wave transmitters operated by the overseas branch of the Office of War Information carried American radio service features. Special performances of radio stars, usually transcribed, regularly were featured. In places where radio could not be received, turntables and public address systems carried the programs. Army hospital ships and troop transports were supplied at the year's end with two hours of running time of transcriptions daily. Similar arrangements were made for submarines. (*See* also RADIO DETECTION.)

U.S.-Latin-American Broadcasts.—Use of radio in psychological warfare continued apace in 1943. The greatest activity, however, was in short-wave transmission to Latin America under the joint direction of the Office of War Information and the coordinator of Inter-American Affairs. OWI was charged with broadcasts to all nations other than South America, with the latter area in the hands of CIAA. In Nov. 1942, programming of all short-wave stations was taken over by the government, though the transmitters were owned independently and operated by the private licensees. An average of some 40 hours daily of program material was broadcast over a dozen transmitters in Spanish, Portuguese and English.

The press division of CIAA prepared and teletyped to various station alignments some 40,000 words daily of news and news commentary in three languages. In addition, program interchanges with Latin America gained impetus and began regular features on the national networks.

Another trend during the year was the development of Spanish language programs on many domestic stations under the general title "How to Speak Spanish." Instruction was largely an adaptation of the phonetic method. These programs were in keeping with the overall effort toward the good neighbour policy. (S. Tr.)

Scientific Developments (U.S.).—Air, military and naval applications and developments of radio techniques during 1943 necessarily overshadowed all other possibilities. The security requirements of the war prevented release and discussion of the scientific advances, in specific and quantitative terms, but there seemed little doubt that when the results of the new work could at last be applied to peacetime services there would be found to be available many new tools that would add to radio's value to humanity. Most people think of radio only in connection with the mass-communication or "broadcasting" aspect of its ability to transmit intelligence. Even in that field 1943 saw confirmation of earlier suggestions that the newer proposals of frequency modulation and television would become still more important shortly after hostilities cease. Testimony before a senate committee, which was studying the problems of revising existing legislation as to radio, brought out that in the broadcasting of speech and music it appeared that frequency modulation would be likely to supersede ordinary broadcasting for all local or regional operations, but that present methods would probably be retained for maximum uses including service to rural areas. It was also indicated that the visual broadcasting services of television and facsimile (the so-called "magic printing press") might well be expected to provide new and important industrial activity in the postwar period, particularly in view of the technical improvements in both systems that had been attained in order to meet military requirements.

In point-to-point communication also, 1943 saw a realization that it would be reasonable to expect faster and more accurate service over even greater distances, together with the possibilities of much expanded short-distance services. The announced use of satisfactory portable short-wave radio telephone in battle areas immediately suggested that similar instruments would be valuable to state and municipal fire-fighting and police organizations and, with the extension of the useful spectrum of radio waves, might perhaps even lead to the possibility of vastly extended person-to-person radio communication.

In non-communication radio applications, there was a flurry of announcements with respect to "radar"; generally known to be a radio direction-finder capable of determining not only the bearing of an objective, but also its distance, without requiring the co-operation of two stations for triangulation studies. Such reports gave rise to expectations that in postwar marine navigation the fog obstacle would be largely overcome, and that in flying there would be fewer hazards due to uncertainty as to safely available space. (*See* also ADVERTISING; FEDERAL COMMUNICATIONS COMMISSION; RADIO DETECTION.) (J. V. L. H.)

Great Britain.—On Nov. 14, 1943, the British Broadcasting corporation celebrated its 21st birthday. In 21 years it had grown from a staff of 31 of the first British Broadcasting company to one of over 12,000.

During the year the chief events of internal organization were the retirement of Sir Cecil Graves owing to ill health and the consequent changes in the higher officers of the corporation. Robert W. Foot, hitherto joint director-general with Sir Cecil, was appointed sole director-general, and a new post was created under him, that of editor-in-chief. The first holder of this post was W. J. Haley, till then joint managing director of the *Manchester Guardian* and *Evening News* and also a director of Reuters and the Press association. Sir Noel Ashbridge, previously controller of the engineering division, became deputy director-general.

Among the chief developments during the year were the growth of rebroadcasting of BBC programs by American stations, which by November were taking 175 hours per week; the increase of exchange programs between the BBC and stations in the U.S.A. and Canada, such as "Trans-Atlantic Call," and the creation of per-

manent BBC offices in Cairo, San Fr o and Canada. Seymour Joly de Lotbinière was appointed to take charge of the last.

All these are instances of the BBC's avowed policy of making radio a means of international communication in the fullest and most reciprocal sense. With these developments can be linked the virtual doubling of the broadcasting time given to the Latin-American service. This service hitherto had consisted of five hours which had to be divided between the Portuguese and Spanish tongues, one service, owing to the lack, in wartime, of transmitters and their associated apparatus and labour, having to go off the air in order to make way for the other. These difficulties finally having been overcome, in November the Latin-American Spanish and the Latin-American Portuguese services were enabled to run independently of each other with broadcasting hours of five and a half Spanish and four Portuguese.

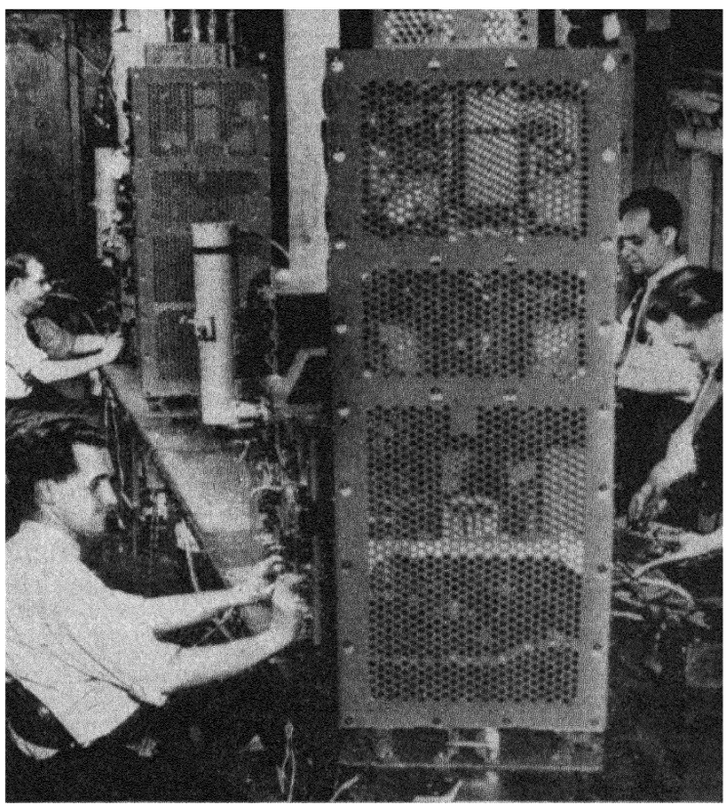
A further development occurred in the empire service with the introduction in June of the general overseas service, a scheme of programs specially designed not for residents in various parts of the empire but for the many thousands of exiles and servicemen from Britain then scattered all round the globe, especially in the middle east and adjacent territories. This was further expanded in November.

In a quite different way, too, the BBC made its programs known all over the globe through the development of a special department—the London transcription service—which sent out records of selected programs to some 30 or 40 broadcasting companies in the English-speaking world. Most important of these was the complete series of "The Man Born To Be King," the radio dramatic version of the life of Jesus, written by Dorothy Sayers. This had created much controversy before it came on the air in the home service children's hour in 1941. The early objections tailed into insignificance, however, when the series was actually heard, and the BBC was commended by leading churchmen of all denominations for its contribution to Christian knowledge.

During the year there were several notable expansions of the services in foreign languages, one being that for the Japanese. This service, starting on July 4, gave news in the Japanese language four days every week. On the other three days the program consisted of news and commentary in English. On the same date the service in English for Europe was extended to include five-minute daily lessons in colloquial English; and eight days later the European news services were expanded by the addition in English, French and Dutch of special bulletins for the information of the editors of the "underground" newspapers of the continent. Similar bulletins in German, largely for Polish editors, followed in October. In that month, also, two fresh bulletins in French were broadcast daily for all Europe, with especial attention to listeners in eastern and southeastern Europe and in parts of the middle east. At the same time 15 minutes each were added to the Portuguese and Spanish transmissions, these being rebroadcasts of "America Calling Europe" from New York. This rebroadcast service was thus raised from 16 to 18 languages, including English. The total European service broadcast in 24 languages, and for 44 hours in the 24.

Other high lights of the year included the BBC's announcement of the fall of Mussolini only five minutes after the first statement from Rome radio; a service as rapid giving the news of the surrender of Italy; and the remarkable broadcast by Wynford Vaughan Thomas from records which he made in a Lancaster bombing Berlin. Various editions of these records were put out in the home and all the empire services.

On Nov. 29, 1942, the BBC publication, *The Radio Times*, had achieved its 1,000th number; and on Dec. 14, 1942, the BBC published T. O. Beachcroft's *Calling All Nations*, telling the story of the growth of the overseas services from the first tentative empire service of ten years before to the present broadcasting of 48 languages. On Jan. 2, 1943, another pioneering effort celebrated its 2,000th performance—the daily program, "Music While You Work," specially devised to help factory workers.



Radio Detection. The curtain which hid one of the most secret of technical war developments was slightly lifted for a brief period when a joint army-navy release on April 25, 1943, revealed the existence of "radar" and described its early development. On July 13 the chief of the review branch of the war department bureau of publication issued instructions prohibiting further publicity on the subject.

According to the release of April 25, "The term **'radar'** means radio-detecting-and-ranging. Radars, then, are devices which the Allies used to detect the approach of enemy aircraft and ships, and to determine the distance (range) to the enemy's forces."

Such devices, used by the British and called "radio-locators," were instrumental in saving England during the aerial blitz in 1940–41 by indicating the approach of German raiders long before they reached target areas. Thus the R.A.F. and the ground forces were given time to prepare their defenses. At Pearl Harbor on the morning of Dec. 7, 1941, radar detected the Japanese planes 45 minutes before they struck, while they were 135 mi. away, but its indications were ignored.

The system operates with ultra-high-frequency radio waves (of wave-length below 10 metres) which, like light, can be focused in a beam and swept around, covering air and sea. Striking a ship or aeroplane, they are reflected back like an echo, and the returning signal is detected with appropriate equipment. Since the waves travel with the speed of light (186,000 mi. per sec.) the round trip takes a very brief period of time, yet it can be measured accurately, and the range determined.

A navy statement issued May 23 said that the birth of radar was the discovery in mid-Sept. 1922, by Dr. A. Hoyt Taylor and

TESTING RADAR TRANSMITTERS at a U.S. war plant before shipment to the U.S. navy in 1943

Leo C. Young of the Naval Aircraft Radio laboratory, that radio signals were reflected from steel buildings and metal objects. They then suggested that this effect might be employed to detect from one warship the presence of enemy vessels, irrespective of fog, darkness or smoke screen. Later it was found that aircraft crossing a line between a radio transmitter and a receiver operating directionally gave a characteristic effect which showed the presence of the aircraft.

Experimentation continued, and in Jan. 1931, the radio division of the bureau of engineering of the navy ordered the Naval Research laboratory to "investigate the use of radio to detect the presence of enemy vessels and aircraft." The war department was informed of the possibilities of these methods in 1932, the comment being made that "a system of transmitters and associated receivers might be set up in a defense area to test its effectiveness in detecting the passage of hostile aircraft into the area. Such a development might be carried forward more appropriately by the army than by the navy."

By 1932, aeroplanes in motion nearly 50 mi. away from the transmitter had been detected. A report on the work up to the middle of that year stated that the object of the investigation was to develop instruments for the collection, automatic recording and correlating of data to show position, angle and speed of approach of objects in the air. The types of apparatus and systems for detecting enemy aircraft and vessels had developed to such a degree by March 1933, that the Naval Research laboratory was able to outline in detail the theoretical military applications.

With the aid of an appropriation of $100,000 made in 1935 upon the initiative of the naval appropriations committee of the house of representatives, and with the co-operation of the national bureau of standards and representatives of the army, the work continued. In June 1936, Admiral Harold G. Bowen, then chief of the navy bureau of engineering, directed that plans be made for the installation of a complete set of radar equipment aboard ship.

It was on Feb. 17, 1937, that the assistant secretary of the navy, Charles Edison, and the chief of naval operations, Admiral Leahy, witnessed a demonstration of aircraft detection by the first radar set developed in the United States. Two years more were required for the design and construction of a practical shipboard model. Such a set was installed on the U.S.S. "New York" late in 1938. It was tested at sea during the winter cruise and battle manoeuvres carried on during the first three months of 1939.

The apparatus was so successful that in Oct. 1939, additional sets were ordered, on a bid basis, from commercial sources, and the following year other manufacturers were called in to aid in supplying the armed forces with needed equipment. After that, practically every important unit in the electronics industry was working on one phase or another of this important project. Some of these companies had previously worked on allied researches, such as the use of a reflected radio wave to determine the altitude of an aeroplane above the ground.

While the later phases of the work in the United States were taking place, the British "radio-location" system was developed, mainly under the direction of Sir Robert A. Watson-Watt. Members of the British technical mission, in Sept. 1940, held a series of conferences with representatives of the navy department and the Naval Research laboratory and much information was exchanged.

"During the conference with the British technical mission," the navy's statement of May 23 revealed, "it was found that the British equipment was similar in many respects to the equipment developed by the Naval Research laboratory, and members of the British mission stated that the British development had resulted from articles reporting the preliminary work between 1926 and 1930 of Dr. Taylor and Mr. Young, of the Naval Research laboratory, and Dr. Breit and Dr. Tuve, of the Carnegie Institution of Washington, studying the height of the Kennelly-Heaviside layer. With this preliminary study as a base, the British independently had developed their radar system and independently had arrived at frequencies and circuits very similar to those developed in this country."

Though the most spectacular use of radar was in the detection of aeroplanes, it also had value against ships, as was shown by the accuracy with which, in May 1941, the German battleship "Bismarck" successfully aimed its first salvo against H.M.S. "Hood," quickly sinking the British ship, although it was 13 mi. away. This was attributed to the use of some radio detection system. In night action in the Solomons, a United States battleship was able to locate and sink a Japanese ship 8 mi. away, although the enemy was not seen until actually on fire.

Undoubtedly such methods would find wide application after the war, particularly in allowing aeroplanes and ships to navigate safely in all kinds of weather, in darkness and in fog.

(J. STO.)

Radiology. In the field of diagnostic radiology the roentgenologic characteristics of atypical (virus) pneumonia were worked out, and the value of roentgenography in the differential diagnosis was established. Serial roentgenograms made during the course of the disease were found to be of aid in clarifying its course and pathology.

Further studies of the heart and great vessels by the roentgen ray, with the aid of an opaque medium, or angiocardiography, revealed the value of this procedure in the diagnosis of congenital heart lesions.

The technique of venography was improved. As this method of examination has been more widely used, its value has been shown to be greater and considerable knowledge has been added as to the pathology of venous thrombosis.

Other technical advances include the development of a stereoscopic method for the localization of opaque foreign bodies in the orbit; a new method for the making of stereoscopic films, and a technique for better soft-tissue visualization.

In treatment, more adequate reports on the effects of supervoltage therapy appeared. Treatment with roentgen rays generated in the region of 1,000,000 volts was shown to give a larger depth dose and a decreased dose to the skin, so that the treatment was in general better tolerated. Statistical studies, however, which covered a period of over five years, showed that the results are only a trifle better than at 200,000 volts.

The most conspicuous development in the therapeutic field was the report of the physical studies of the radiations from the betatron. This instrument produces either cathode rays or X-rays. The cathode rays produced at 20,000,000 volts have the power of penetrating 10 cm. of tissue. Studies of the X-rays produced at various voltages from 5,000,000 to 20,000,000 showed that the point of maximum dose becomes deeper as the voltage is raised, so that at 20,000,000 volts it lies between 3 and 4 cm. below the surface and is considerably higher than the surface dose. While these radiations were not yet applied to the treatment of disease, the physical observations raised hopes that the betatron might develop into a more efficient instrument for the treatment of deep-seated cancer than any so far evolved.

(S. J. Hy.)

Radium. A small amount of radium is recovered in the United States as a by-product in the treatment of ores mined primarily for vanadium and uranium, but the bulk of the world output is derived from the ores of the Belgian Congo and Canada. Ore from the Eldorado mine at Great Bear lake in Canada is treated at the company's refinery at Port Hope, Ont. In 1940 some 1,200 short tons of Congo ore were sent to the United States after the refinery in Belgium fell into German hands, but it was not known whether this was continued. It was demonstrated by field use that the Geiger-Mueller counter of gamma-ray emissions could be used as a prospecting instrument, not only for pitchblende veins but also for mildly radioactive host rocks in large scale reconnaissance surveys. (*See* also Uranium.) (G. A. Ro.)

Railroad Retirement Act: *see* Social Security.

Railroads. The outstanding facts in the railroad record of 1943 in the U.S:

(1) The volume of traffic, both freight and passenger, and the gross revenues, were higher than in any previous year.

(2) The transportation demands of the army, the navy, the war production plants, and the lend-lease administration were met in a manner which brought ready praise from their high officers.

(3) Notwithstanding the heavy demands of the war agencies the civilian freight traffic was satisfactorily handled and, while many passenger trains were badly crowded and frequently late, the painful expedient of rationing of passenger travel was avoided.

(4) New high records in rail operating efficiency were recorded. The more effective utilization of locomotives, cars, trackage and terminals made possible the production in 1943 of nearly 80% more ton miles and 25% more passenger miles than in 1918 (World War I) notwithstanding the fact that in 1943 the locomotives and passenger train cars were about one-third less, and the freight cars were about one-quarter less than in 1918.

(5) In protest against wage increase awards of boards appointed by the president under the Railway Labor act and modifications ordered by the director of economic stabilization, the unions of the non-operating and operating railroad employees issued strike orders to take effect on Dec. 30. On Dec. 24 the non-operating unions and two of the operating unions agreed to the arbitration of their pending disputes by the president and rescinded their strike orders. Three of the non-operating unions rejected presidential arbitration. On Dec. 27 President Roosevelt, acting under authority of the same 1916 law utilized by President Wilson in Dec. 1917, ordered the secretary of war to take over and operate all railroads in the United States. The executive order commandeering the railroads stated as reason for the unexpected action that "the continuous operation of transportation service in the nation is necessary for the movement of troops, materials of war, necessary passenger traffic, and supplies and food for the armed forces and the civilian population, and is otherwise essential to the successful prosecution of the war," and that "the continuous operation of some transportation systems is threatened by strikes called to commence Dec. 30, 1943."

As of midnight, Jan. 18, 1944, the roads were restored to private operation after the recalcitrant unions had accepted a settlement worked out by the president and approved by the director of economic stabilization.

Taking these subjects in the order given we may first note certain specific detail in traffic volume. The 1943 results, in Table I, may be compared with the immediately preceding year, the year 1939, the last year unaffected by national defense, and lend-lease activities, and 1918, the last year of World War I.

Table I.—*Volume of Traffic*
(*in thousands of millions*)

Item	1943*	1942	1939	1918
Revenue ton miles	725	638	333	405
Passenger miles	85	54	23	43

*Figures for 1943 partially estimated.

The large volume of traffic in 1943 naturally resulted in a new high in gross revenues although large parts of the tonnage and passengers were government freight and members of the armed forces which, in substantial part, moved under reduced rates. The cancellation by the Interstate Commerce commission of the freight rate increases of approximately 6%, authorized by the commission in 1942, also held down gross revenues.

The condensed income account given in Table II shows that the increase in revenues in 1943 over 1942 was less in amount than the sum of the increases in operating expenses and taxes, and that the net income available for dividends and other appropriations from income was less than in 1942.

Table II.—*Condensed Income Account—Class I Railroads*
(*in millions*)

Item	1929	1939	1942	1943*
Operating revenues	$6,279	3,995	7,166	9,075
Operating expenses	4,506	2,918	4,601	5,650
Taxes	307	356	1,109	1,850
Net railway operating income	1,252	589	1,485	1,380
Per cent return on investment	4.81	2.25	5.50	5.60
Net income after fixed & contingent charges	897	93	902	880
Dividends paid	490	126	202	215

*1943 partially estimated. From *Railway Age*, Jan. 1, 1944.

In support of the assertion herein made that the adequacy and quality of rail service in 1943 met the military needs, the opinions of high-ranking officers may be quoted. Lt. General Brehon Somervell, the head of the Army Service Forces, wrote for the *Railway Age* of July 24, 1943:

American railroads and American railroad men are accomplishing one of the most brilliant achievements in this global war. With limited equipment, with constantly diminishing manpower, with forceful leadership through the Association of American Railroads, with elimination of peacetime competition, the carriers have pooled their brains and their equipment to move the army as demanded. It has been by far the largest moving job in the history of America. It has been done with outstanding efficiency.

The views of the navy were published in the same issue of *Railway Age* in an article by Vice-Admiral S. M. Robinson, chief, Office of Procurement and Material, who wrote:

The navy has been obliged to call on the railroads to perform seemingly impossible feats in the transportation of personnel and munitions. In every

case the railroads have risen to the occasion.

In operating efficiency the commendable record of 1942 was continued and in most items improved upon. The freedom from congestion in freight service and the more effective utilization of freight cars were attributable in large part to the co-operation of shippers and the helpful co-ordinating influence of the ODT and the ICC. The significant items indicative of freight performance were:

Table III.—*Freight Car and Freight Train Performance*

Item	9 Months ended Sept. 30		
	1939	1942	1943
Tons per loaded car	26.5	31.4	33.5
Car miles per serviceable car day	34.5	47.5	49.8
Per cent loaded of total car miles	62.3	62.7	63.7
Ton miles per car day	501	906	1,036
Per cent cars unserviceable	9.4	5.2	2.4
Tons per freight train	792	1,021	1,111
Speed of trains (m.p.h.)	16.8	16.0	15.5
Ton miles per train-hour	13,300	16,300	17,200
Locomotive miles per locomotive day	103	122	125
Per cent locomotives unserviceable	30.7	13.6	11.8

Other important developments during the year include the reports of the board of investigation and research, set up under the Transportation Act of 1940, and the improvement in the financial condition of the railroads. On Sept. 24 the board issued a report favouring uniform freight rate scales throughout the country, and thus brought to public attention the time-honoured controversy over discrepancies between eastern, southern, and western rates.

During 1943 four railroads were discharged from receivership or bankruptcy, while two small companies entered trusteeship, so that as of the end of the year 85 companies were in the hands of receivers or trustees, of which 30 were "Class I" roads operating 27% of total "Class I" mileage. A series of supreme court decisions during the year upheld the methods of valuation used by the Interstate Commerce commission in reorganization cases, in a number of which the stockholders' equity was eliminated. Reduction of debt made possible by increased earnings left the industry in an improved financial condition. (*See* also BUSINESS REVIEW; INTERSTATE COMMERCE COMMISSION; NATIONAL MEDIATION BOARD.) (W. J. C.; H. E. DL.)

Other Countries.—During 1943 the outstanding feature of railway developments throughout the world was the proof that railways are an integral part of the war machine of the various belligerents, as might be witnessed by their high priority as a target for air attack. Further the theory, steadily gaining ground during the two inter-war decades, that alternative means of land transport were gradually replacing railways as the prime means of moving masses of people and commodities by land, was falsified, owing to the restrictions effective in so many countries on the consumption of oil products and rubber. This background, almost universal in five continents, explains why the main problem facing railways in the vast majority of countries was that of attempting to deal with overloads of traffic, and, indeed, restricting as much non-essential traffic as possible.

Great Britain.—The British railways proved no exception to this general rule, but in a country where, though population is dense on the average, hauls are comparatively short and no large centres are far from a coast possessing good harbour facilities, the question did not become quite so acute as in other countries. Britain was well provided with urban and country bus routes, and some of these had been converted to gas producer working, consequently, the load on the railways was to that extent eased, though interurban and long distance services, being duplicate with railway routes, were discontinued. Additionally, the close correlation through railway financial integration of the railroad passenger services enabled widespread economies to be effected in vehicle mileage.

In general, the most serious problem arose through the withdrawal of skilled staff, chiefly to the armed forces, thereby limiting the train mileage possible, though extensive recruitment of temporary women employees eased the gravity of the position. Since 1939 no official operating figures had been published, but, in general, a study of timetables reveals that passenger train services had been reduced by approximately 30%, and, doubtless, freight train mileage had risen by an important percentage as compared with the prewar figure. Overall percentages do not give a correct picture because areas differ widely, and the changed flows of traffic since 1939, owing to civil evacuation and military activities, overloaded certain railway facilities little used in prewar years; other facilities were not being called upon to carry their due quota. Shortage of staff creates difficulty in every branch of railway working, making for slower station working with delays to trains and their connections, a reduced output in repair shops with more motive units awaiting attention, a reduced standard of track maintenance and inability to effect much needed refurnishing, cleaning and painting of rolling stock, stations and buildings.

Britain was still a front line war area with rigid black-out restrictions and liable to air attack at any point at any hour; yet withal, the accident record of the British railways was not far short of the peacetime standard, and smooth running of the faster trains revealed that, in spite of difficulties, the reduction in standard of equipment, track and signalling was not openly noticeable. Every effort was made to reduce unnecessary travel, but the summer week-end holiday peaks were heavy, and the attraction of a holiday at home to people who had worked overtime for four years had, somewhat naturally, lost its appeal. Zoning orders in regard to food distribution helped to ease freight traffic loads as did heavier loading of wagons, of which there had been no general shortage, probably assisted by the completion of small but useful track and yard facilities at the bottlenecks created by new traffic routes.

Normal programs of construction and improvements, such as electrification, had long been held up; on the other hand, few instances occurred where even branch lines had been dispensed with and tracks removed. Locomotive construction was limited to standard types and, naturally, the bulk of output was in the heavy freight category. The U.S. built "Austerity" type 2-8-0 class locomotives and their British counterparts were much in evidence throughout Britain. Long non-stop runs, such as Carlisle–London, 199 mi., still remained a feature of British working, as did financial profit-earning capacity, and, though the rental figure paid by the British government remained at about £43,000,000, it was likely that the surplus of net revenue over this figure accruing to the government would not be lower in 1943 than the £45,000,000 retained in 1942. As a typical example of substitute materials concrete blocks were being used for timber sleepers or ties in sidings.

Continental Europe.—With the exception of Switzerland, Sweden, Spain and Portugal, and a small mileage of the Turkish state railways in Europe, the railway systems of continental Europe formed an integral part of the German war machine and provided the transport arteries of the German armies. Under such conditions physical improvements were limited to those required for strategic purposes and little data were available as to changes in 1943. The Italian state railways became a battleground with the southern sections in Allied hands and the northern rail gateways, such as Genoa, Turin, Milan, Bologna, Bolzano and Trieste as objectives of air attack. In France much branch line and other mileage was known to have been removed and despatched to the U.S.S.R. for military lines, and the same applied in Belgium.

Progress was made with electrification of the Brive–Montauban section of the line from Paris to the Spanish frontier at Cerbère/Portbou, otherwise electrified throughout from Paris to Sète. Preparatory work continued on the conversion of the Paris–Lyon main line to electric traction. French and Belgian locomotive builders were fully occupied in turning out German standard locomotives suited to working in eastern Europe and the Balkans, and some progress was made in extending the "Metro" underground lines in Paris and eliminating level crossings. Many sections of French and Belgian railways were exposed to frequent air attack to prevent the movement of troops and military stores: civil traffic was cut to the minimum and lack of motive power and equipment was said to be acute.

In Germany heavy air attacks extensively damaged railway facilities, especially in the industrial Ruhr and the Rhineland, while the railway load was eased where possible by diversion to the inland waterways. Evacuation of industrial production to Austria and Czechoslovakia necessitated improvements in the freight handling facilities in those countries and to a lesser extent in Hungary, while the strategic importance of the main line to Salonika and Athens, frequently damaged by patriot activities, was understood to have necessitated additional accommodation at several junctions. In general, bridges damaged in the fighting of 1940–41 had been almost completely repaired, and in Bulgaria progress had been made in the construction of new lines of strategic importance, such as Gueschevo–Kumanovo, Simeti–Demir Hisar and Montchilgrad–Gümüljina. Rumanian state railway trains were reported to be running into Odessa, the schedule from Bucharest requiring about 21 hours.

In Switzerland further sections of the Swiss Federal system were electrified, notably Winterthur–Schaffhausen and Neuchâtel–Les Verrières, but the most difficult problem was that of handling the heavy coal traffic from Germany to Italy via the Gotthard and Simplon–Loetschberg routes; this traffic presumably had nearly ceased by September. The Swedish state railways faced equally with a serious fuel shortage made further progress with electrification—45% of state railway mileage carrying 85% of the total traffic was reported as electrified. Conversion of the Hälsingborg-Hässleholm and Eslöv routes was due for completion in 1943. Further company-owned railways in the Malmö area were to be taken over by the state. In Spain the Santiago section of the new Zamora–Corunna railway was opened, embodying many heavy engineering works, and satisfactory progress was made with the output of new locomotives and equipment; heavy arrears of repairs had still to be undertaken before the pre-civil war situation would be fully restored. Electrification of the Madrid–Avila main line progressed but slowly, though the Villalba–El Escorial section was nearing completion in spite of materials difficulties.

Africa.—No data were published covering new railway mileages opened by the Allied forces controlling North Africa, and the need for the Mediterranean–Niger route southwards from Kenadza had grown less with the victories of the United Nations in Tunisia. In Portuguese East Africa construction was understood to be proceeding with the new lines in the Tete area north of the Zambezi. The line from Hercules to Koedoespoort in the Pretoria area was opened by the South African railways in June 1943. A line from Kena (Nile valley) to Safaga (Red sea) was reported as completed by Egypt, where many locomotives had been converted to burn oil fuel. A standard Beyer-Garrett type of locomotive was in production in Britain, suitable for working on many African lines laid with light 60-lb. rails.

Asia.—Definite information was not available regarding the progress made by Japan in linking more closely the Siamese railway system with those of Malaya and Indo-China. The headquarters of the South Manchurian railway had been moved from Dairen to Hsinking. Equally U.S.S.R. railway construction in Asia was not publicized. The Turkish state railways opened in July 1943 their new line from Diarbekir through Bismil and Cizre towards the Iraq frontier, and progress was made with the Mamuret el Aziz route via Palu to Karpahur, now open to traffic. Thence onwards via Mush and Van to Iran the line was under construction.

South America.—The link between the Argentine and Chilean railways via Salta made further progress and reports stated that trains were running to a point 190 miles from Salta; there were 158 miles further to the Chilean frontier at Paso de Socompa, whence Antofagasta is 211 miles distant; the route throughout was unlikely to be completed until 1945, and on the Chilean side the railhead was still 52 miles from the Argentine frontier. Argentina in Aug. 1943 agreed to reconstruct the Transandine railway. Fuel shortage continued very serious for locomotive purposes in Argentina. Many improvements were being effected on the Brazilian railways, thanks to American help, especially in the case of the Victoria–Minas line.

Australia.—The New South Wales government railways conducted trials with a new semi-streamlined 4-6-2 "Pacific" type locomotive, known as class C 38, and working at the high pressure of 248 lb. per sq.in. With Australia and New Zealand both virtually theatres of a war area it was not possible to give data on railway improvements or additions, but, as in so many other countries, the main problem to be faced was that of attempting to carry the heavy traffics offering with limited facilities for the construction of new equipment and repairs to older units. The transfer of coastal traffic to the railways and the restriction of highway movement to conserve gasoline and tires were partial causes of the increased railway load, while the various breaks of gauge limited the possible transfer of motive power units between the various state systems.

Canada.—Still increasing traffics and revenue were the outstanding features of the working of the two large Canadian railways in 1943, but with the rise in expenditure for salaries, wages, stores and fuel the increase in net revenue, predominant during the earlier war years, commenced to slacken. The latest Canadian National figures revealed an increased net revenue over 1942, but the Canadian Pacific figures indicated that the net revenue for 1943 would approximately equal that of the preceding year. Events of importance were the opening in July of the great new passenger terminal of the C.N.R. to replace the old Bonaventure station at Montreal, thus bringing to fruition a scheme planned and commenced over 15 years before, and the close correlation between the C.N.R. and its famous air subsidiary the Trans-Canada Airlines. The C.P.R. was also developing its airlines which are more of the shorthaul feeder character. Both systems received important additions to their heavier motive power classes and electric locomotives operated trains in the new station area at Montreal. Further Canadian mileage was being equipped with automatic signals. (*See* also DISASTERS; UNITED STATES.)

Ramey, Howard Knox (1896–1943), U.S. army air officer, was born Oct. 14 in Mississippi. He served in the signal corps, aviation branch, in World War I, and later attended the air service photography school, the air corps tactical school and the command and general staff school. Regarded as one of the outstanding heavy bombardment officers of the U.S. army air force, Brig. Gen. Ramey was commander of the 5th bomber command of the 5th U.S. air force, a post to which he succeeded the late Brig. Gen. Kenneth M. Walker in Jan. 1943.

General MacArthur announced from Allied headquarters in Australia on April 3 that Gen. Ramey and his crew had been reported missing in action after failing to return from a recent mission.

Ramírez, Pedro Pablo (1884–), Argentine army officer, was born Jan. 10 at La Paz, Entre Ríos province, Argentina. He was graduated from the Argentine Military college in 1904, and was commissioned a first lieutenant in 1910. He studied in Germany, 1911–13, serving with Kaiser Wilhelm's famous Fifth Hussars. He resumed his military career on returning to Argentina and rose to the rank of general. In 1930, he mobilized the army to help Gen. José F. Uriburu overthrow the liberal Irigoyen regime. But in 1932, Uriburu and his cohorts were overthrown in turn, and Ramírez suffered a temporary eclipse. The Argentine general, who expressed admiration for Italian fascism, helped organize the Milicia Nacionalista, modelled after the Italian blackshirts. In 1942, he was appointed war minister by Pres. Ramón S. Castillo but was subsequently ousted from this position. On June 4, 1943, Gen. Arturo Rawson with the aid of Ramírez, overthrew the Castillo regime; Rawson, president for three days, stepped down in favour of Ramírez on June 7. In his first public statement, Ramírez pledged to retain the republican form of government, co-operate with American nations and continue neutrality "for the moment." Throughout 1943, however, he jettisoned freedom of speech and the press, established a dictatorship, instituted anti-Jewish measures, suppressed newspapers that criticized his rule and in Jan. 1944 decreed the dissolution of all political parties.

Rationing. Consumer rationing began in the United States in 1942, to meet shortages in supplies of certain civilian goods needed for, or curtailed by, the war program. The legal basis for rationing had been laid in 1941 in the Priorities and Allocations act of May 31, 1941, and was clarified and elaborated in the Second War Powers act of March 27, 1942. The president delegated his rationing authority, with respect to food, to the War Food administration, and with respect to all other matters, to the War Production board. In making its decisions, the WPB is guided by the recommendation of certain so-called supply agencies, notably the Petroleum Administration for War in the case of gasoline and fuel oil, and the Rubber director in the case of tires. In the case of some commodities, however, such as petroleum, where PAW rather than WPB has power to decide, the determination is made by a so-called supply agency. The Office of Price Administration rations pursuant to delegations of authority issued by the WFA and WPB.

Tires, automobiles and typewriters were among the first commodities upon which the impact of war was felt. They were rationed by certificate, as were bicycles, because eligibility to purchase the commodity must be determined separately in each individual case. Coupon books, on the other hand, were used when the commodity was distributed equally to all citizens or to all those in a given class, such as owners' of automobiles or of oil-burning heating or cooking equipment.

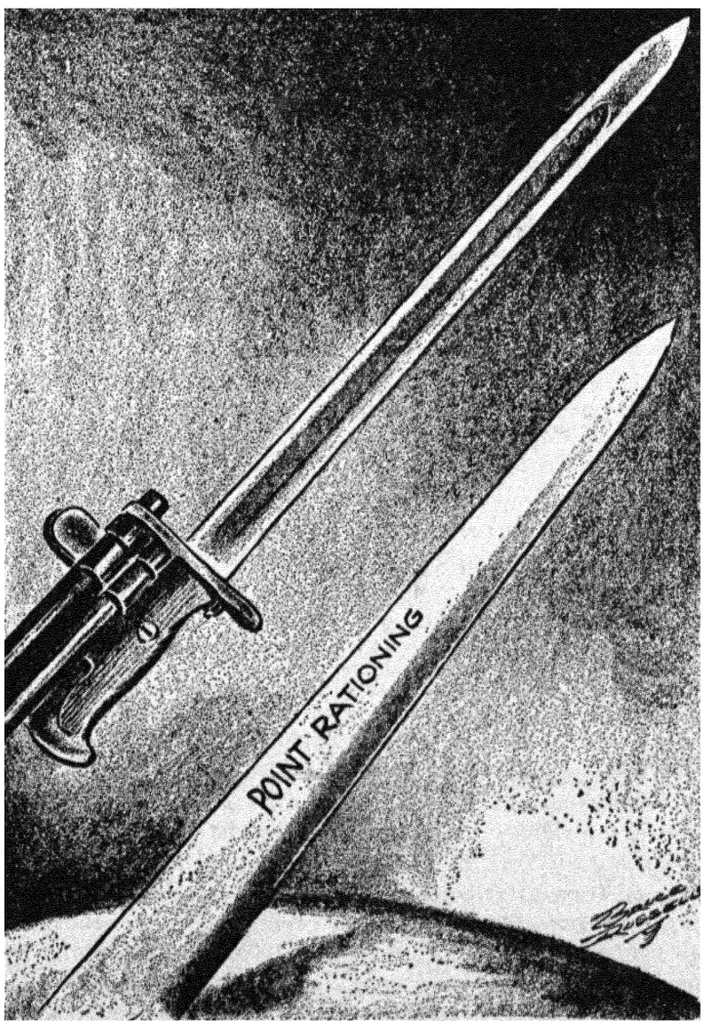
War Ration Book I, put in use in May 1942, first provided coupons for sugar, then also for coffee and shoes. A separate coupon book was issued for rationed gasoline and coupon sheets for rationed fuel oil.

The rationing program was greatly extended in 1943, so that by the end of the year it covered a large proportion of U.S. food, including virtually all meats, processed foods, canned goods and many dairy products. A most important development during the year was that of point rationing. Numerous modifications made the program simpler to carry out, and often more equitable to the consumer. Growth of the ration banking system was a significant contribution to the simplification and workability of the program.

"WAITER TROUBLE." Cartoonist Parrish's explanation of U.S. food scarcity in 1943 and the reasons therefor, published in the *Chicago Tribune*

The scarcity of leather, especially of imported hides, and the large demands of the armed forces made shoe rationing a necessity early in 1943. On Feb. 7 the War Production board directed the Office of Price Administration to ration shoes and the order was put into effect the same day. The mechanics of the program were simple. Certain stamps in the War Ration Books were designated as shoe stamps and every individual in the U.S. was entitled to one. At first each succeeding shoe stamp had a four-month period of validity. Later, with the validation of a new stamp, the period was abolished and the stamp was made usable at any time. Consumers were thus relieved of end-of-period pressure to use their current stamps. At the same time it was announced that no further stamp would be validated for six months. Special provision was made to take care of individual hardship cases.

The extension of rationing in March to processed foods, meats and fats was necessitated mainly by the rapidly increasing needs of our armed forces and our fighting Allies. Because canned foods are compact and easily stored, government purchases, especially for overseas shipment, are extremely high. Government requirements were approximately 35% of the total pack for 1943, while the proportion of total dried fruits, dehydrated vegetables and soups ran even higher. At the same time, civilian demand increased while the total output of canned goods was restricted because of the shortages of tin, steel, rubber and manpower. In addition to the decline in allocable civilian supplies of processed foods, the need for rationing was further accentuated by panic buying and consumer hoarding during the nine months prior to rationing.



Meat production, unlike that of canned goods, increased steadily from 1941, with a record production in 1942. Enormous

government requirements, however, coupled with the rise in consumer income which led to a greatly increased consumer demand made rationing a necessity. Fats and oils and later canned milk and almost all cheeses were included under the meat program.

War Ration Book II was issued simultaneously with the start of the processed foods program. Blue stamps were reserved for processed foods; red stamps for meats and fats. War Ration Books III and IV consisted of point coupons for meats, processed foods and other commodities, and unit stamps for sugar, shoes and possible future programs. Book III was distributed by mail June 15–July 15, and Book IV through individual registration in October.

Point rationing was introduced with the processed foods program, which went into effect on March 1, 1943. A separate rationing program for each commodity would have been extremely cumbersome and would have made no allowance for regional or individual food preferences. Under the point system, coupons designated for groups of food were valid for a certain number of "points," and the amount of goods that could be purchased was determined by the point value assigned to each item. These point values were changed from time to time according to the supply situation and as the character of demand became clear from experience under the program. Point values tended to perform the same function that dollar prices normally perform in bringing supply and demand into equilibrium.

An outstanding feature of rationing was the "flow-back" of ration currency. Local War Price and Rationing boards issued books of ration stamps to consumers and granted certificates to institutional, industrial and other bulk users. Stamps and certificates flowed to retailers, wholesalers, processors and primary distributors, the surrender of ration currency being required with each exchange of goods at each level in the trade. The last two groups were required to turn over all ration currency to OPA and the currency they turned over had to match the value of the rationed goods they transferred.

"HOME FRONT BAYONET," by Russell of the *Los Angeles Times*

The mechanism of the "flow-back" of ration points was simplified during 1943 by the use of a ration banking plan worked out in co-operation with the American Bankers' association. About 84% of U.S. commercial banks participated in the program, which enabled retailers, wholesalers, primary suppliers, bulk consumers and institutional and industrial users to deposit their ration currency in co-operating banks and to make and receive payments in the form of checks. It was estimated that approximately 50,000,000 deposits would be made annually and about 637,000,000 items would be handled by the banks each year. The ration banking program relieved local boards throughout the U.S. of a tremendous burden of counting, auditing and exchanging stamps and coupons for certificates of larger denomination. The producers and distributors of rationed goods benefited likewise from the time and cost-saving features instituted by ration banking.

The second half of 1943 was characterized not so much by the extension of rationing as by its modification. Forms and procedures were simplified considerably. Operating techniques were improved through co-operation with both industry and consumers. One of the improved techniques worked out was that of enumerating stamps by weight rather than by counting. Formerly the retailer had to count an enormously large volume of stamps. After intensive research it was found that large quantities of stamps could be enumerated more accurately by weighing than by counting and the change relieved the retailer of a real hardship. All the programs were amended in various ways which made it simpler to attend to individual needs. For example, local boards were given authority to grant additional quantities of food ration points to people living or working in isolated areas who could not otherwise get a nutritionally adequate diet. A plan for supplementing ration stamps with plastic tokens was scheduled to go into effect early in 1944. Under the proposed plan each stamp, regardless of original face value, was to have a value of 10 points in each program, which would eliminate the time-consuming job of sorting stamps. Change would be given consumers in the form of tokens which would remain valid indefinitely. The expiration date of ration stamps would be extended for much longer periods. Under the token plan it was expected that War Ration Books III and IV would last two years.

By the end of 1943, OPA was rationing new automobiles, bicycles, tires, gasoline, fuel oil, coal and oil heating stoves, some solid fuels, typewriters, rubber footwear, shoes, sugar, canned and processed foods, meats, fats and some dairy products. Coffee, after having been rationed for seven months, was released from rationing during the year. Plans had been completed for rationing coal, should it become necessary. Dates upon which rationing began: 1941—new tires and tubes, Dec. 30. 1942—recapped and recapping tires, Feb. 19; new automobiles, March 2; typewriters, March 13; sugar, April 28; gasoline in 17 eastern states, May 12; nation-wide mileage rationing, Dec. 1; bicycles, July 9; rubber footwear, Sept. 29; fuel oil, Oct. 22; coffee, Nov. 29 (released July 29, 1943); coal and oil heating stoves for private dwellings in 30 states, Dec. 19 (nation-wide Aug. 24, 1943). 1943—shoes, Feb. 7; processed foods, March 1; meats, fish, fats, oils, cheese, March 29; canned milk, June 2; soft cheese, June 6; firewood in Pacific northwest, March 1; coal in Pacific northwest, Sept. 20; jellies and preserves, Oct. 31..(*See* also BUSINESS REVIEW; PRICE ADMINISTRATION, OFFICE OF.) (C. Bs.)

Ray, Charles (1891–1943), U.S. actor, was born in Jacksonville, Ill., on March 15. He received his early schooling in theatricals in stock shows and vaudeville and worked in motion pictures as an extra. Ray rose to motion-picture fame as a homespun hero and was at the height of his career in the early 1920s. His name later gradually disappeared and with the advent of sound pictures Ray could find only subordinate roles. He toured vaudeville houses in an effort to boost his waning popularity, but returned to Hollywood in 1934 and thereafter was cast in minor parts. Among his better-known films were: *String Beans, The Sheriff's Son, The Coward, The Busher, The Girl Dodger, The Egg-Crate Wallop, Greased Lightning, Bill Henry, Crooked Straight, Forty-Five Minutes from Broadway, The Old Swimmin' Hole, Scrap Iron, A Midnight Bell, The Girl I Loved,* and *The Courtship of Myles Standish.* Ray died Nov. 23 in Hollywood, Calif.

Ray, Edward (Ted) (1877–1943), British golf champion, was born in Jersey, one of the Channel Islands. Ted Ray and the late Harry Vardon, also a Jersey native, made up one of the greatest professional golf combinations in Britain. Ray's skillful technique won him many golf competitions including the British Open championship, 1912, and the American Open championship, 1920. Both he and Vardon were beaten by a young amateur, Boston's 20-year-old Francis Ouimet, in a highly publicized three-way play-off at an open championship at Brookline, Mass., in 1913. Ouimet's victory over the veteran English golfers was a startling upset that caught the imagination of the American people and started the game of golf on the road to popularity in the United States. Ray, however, continued to be a formidable opponent and participated in many American and continental matches. He died in London, Aug. 27.

Rayon and Other Synthetic Fibres. By Dec. 1943, rayon fabrics and yarn had become so important to the world at large that in the United States of America, the War Production board issued an allocation quota order setting aside for export to friendly countries 4% of the yarn and fabric produced. From South America and from the various countries in the United Nations group came demands for American-made rayon fabrics or the yarns from which to make fabrics or hosiery. In return for food, shelter and labour provided American forces stationed in such outlying points as New Zealand and Iceland, civilians in those countries were supplied rayon fabrics under the lend-lease agreements. South American hosiery and fabric mills, established during 1940–42, needed yarn to supply their domestic needs.

The production of rayon in the United States in 1943 exceeded the 1942 record year. Preliminary estimates indicated that the total consumption of rayon yarn in 1943 would exceed the previous high year of 1942 by 5.5%. Of this, the filament yarn consumption would exceed the 1942 record by 5% and the staple fibre by about 6%. Aside from the increased production of regular yarn, five of the rayon producers, who in 1942 had been ordered by the United States government to convert part of their facilities to production of special yarn for tire cord, had completed the necessary expansion by Nov. 1943 and expected an annual production rate of 240,000,000 lb. of high tenacity yarn for this purpose by the middle of 1944.

Military use of rayon yarns continued in 1943. It was estimated that approximately 50% of the viscose process yarn and from 10 to 15% of the acetate yarn went into such channels during 1943. Staple fibre rayon was used only in a limited way to augment the wool supply in the early part of the year. This was not important in the later months as the wool supply had improved to such an extent that restrictions on the use of raw wool were lifted by the War Production board in Nov. 1943. However, staple fibre and acetate filament yarn were the main supplies for civilian fabrics, an important part of essential textile requirements for clothing and household articles.

One of the most colourful uses of rayon for military purposes was the successful employment of fragmentation bomb parachutes during the campaigns of 1943 in the South Pacific and in North Africa. Especially in the South Pacific, the low-level flying made possible by the use of the parachute bombs, proved most effective in the capture of important enemy positions in New Guinea and other Pacific island strongholds. The use of rayon fabric provided an inexpensive, lightweight parachute that enabled the bombing crew to escape from their low altitude before the bomb exploded. The slowly drifting bomb was of the type that scattered explosive instead of penetrating the earth. American rayon fabric mills supplied not only their own but Allied forces as well with these effective implements of war.

Not only in the United States was rayon production attaining new importance. In Dec. 1943, statistics of world production, the first since June 1941, were issued by the Textile Economics bureau in New York showing that world total rayon production increased from 2,227,500,000 lb. in 1939 to 3,472,900,000 lb. in 1942, a gain of 56%. Of the 1942 production, 1,447,200,000 lb. was filament yarn and 2,025,700,000 lb. was staple fibre. The filament yarn showed an increase of 26% and the staple fibre an increase of 87% over 1939. The latter increase was due primarily to the use of staple fibre as a substitute for wool and

cotton in the axis countries. In Germany, Italy and France, the total staple fibre production was 1,338,000,000 lb. compared with the United States production of 153,300,000 lb. in 1942. Japan also exceeded American production of staple fibre with a total poundage of 400,000,000. In the production of filament yarn, however, the United States produced more than any other single country, manufacturing 29% of the world's total in 1939 and 33% in 1942. In total production of filament and staple fibre, Germany in 1942 led with 1,100,000,000 lb. (32% of the total), Japan second with 700,000,000 lb. (20% of the total) and the United States making a close third with 632,600,000 lb. (18% of the world total).

This total would probably be less for Germany in 1943 because of the bombings of rayon plants which, according to military reports, were hard hit in the heavy attacks during the latter months of 1943.

The general world picture of rayon production is given in Table I.

The introduction of other types of synthetic fibres continued during 1943. Nylon was not available for civilian use except for approximately 2,000,000 yd. of nylon parachute cloth rejected by the army air forces for parachutes and ordered sold by the War Production board for essential civilian use. Most of this was treated with a special finish to make underwear or infants' wear. Fibreglass, a spun glass cloth, was being used in a coated fabric in place of cotton. It had the advantage of being non-flammable and extremely flexible. Fibreglass was found to be extremely strong within a relatively small area, a two-ply standard yarn being the equivalent in diameter of a 100-denier rayon. In the fibrous form, it was roughly twice the strength of steel piano wire. In a flare chute used in 1943 bombings over Germany, the fibreglass was used as reflector or screen between the blinding white light of the flare and the lightweight rayon parachute used to carry it down. The use of the screen prevented pilots and bombardiers in following planes from being blinded.

Velon was featured in 1943 by a former silk manufacturer who was developing its use in upholstery fabrics both for the home and for automobiles. Velon fabrics showed no stains and were non-flammable. It was impervious to the effects of salt water, heat, cold or tropical conditions. Aralac, the synthetic yarn that was most like wool, previously used only in blends, was offered in 1943 by its producers for use alone or in combination with other yarns. The longer staple of aralac offered special advantages over wool.

Production of all types of synthetic yarns, including rayon, was uncertain by the end of 1943 because of the shortages of wood pulp and chemicals. Manpower was the cause of pulp shortage, the same conditions causing the shortage in paper supplies. The chemical shortages were particularly important in acetate yarn but also were expected to affect pigmented yarn, largely used in civilian fabrics. Plastic yarns, such as cellulose acetate, nylon, vinyon, etc., contained essential chemicals needed for the war effort. The prospects at the end of the year were for a drastically decreased civilian supply. (*See* also SILK; TEXTILE INDUSTRY.) (I. L. BL.)

Reconstruction Finance Corporation.

The Reconstruction Finance corporation was created by congress on Jan. 22, 1932, and started operations on Feb. 2, 1932.

Its original purpose was to aid in financing agriculture, commerce and industry, which were then under great economic stress. Its main activities included the strengthening of the banking structure of the nation through, first, the making of loans and, later, the purchase of and loans on preferred stock and capital notes and debentures in banks, trust companies, insurance companies and mortgage loan companies; loans to railroads; for self-liquidating public works; to business; to mining and fishing industries; for refinancing drainage, levee and irrigation districts and public school districts; for the carrying and orderly marketing of agricultural commodities and livestock and exportation of agricultural and other products; also the purchase of securities from the Public Works administration. The RFC Mortgage company was formed by RFC on March 14, 1935, to aid in the re-establishment of a normal market for sound mortgages on income-producing urban property. The Disaster Loan corporation was created by an act of congress Feb. 11, 1937, and was organized by RFC on Feb. 15, 1937, for the purpose of making loans to those who had suffered by reason of floods or other disasters.

The Federal National Mortgage association was established by RFC on Feb. 10, 1938, to maintain a market for first mortgages insured by the Federal Housing administration under Title II of the National Housing act.

With the necessity for national defense, the following subsidiaries were formed:

Defense Plant corporation	Aug. 22, 1940
Defense Supplies corporation	Aug. 20, 1940
Metals Reserve company	June 28, 1940
Rubber Reserve company	June 28, 1940

The Defense Plant corporation was organized to assist in financing the construction and equipping of defense plants and projects throughout the country and to operate them if necessary, while the Defense Supplies corporation and Metals Reserve company were formed to acquire stockpiles of strategic and critical war materials from all over the world. The Rubber Reserve company was created to build up our stockpile of raw rubber and to develop and supervise the operation of facilities for the production of synthetic rubber.

The Defense Homes corporation (not a subsidiary of RFC but managed by it) was incorporated pursuant to a letter of the president to the secretary of the treasury on Oct. 18, 1940, allocating funds to the federal loan administrator to provide homes of a permanent type for war workers and their families.

The War Damage corporation was created by RFC on Dec. 13, 1941, for the purpose of offering reasonable insurance protection against loss of or damage to property resulting from enemy attack in the United States and its possessions.

The United States Commercial company was created by RFC March 27, 1942, its original purpose being to compete with enemy countries for the purchase of materials which might be of use to the enemy. It was transferred to the Foreign Economic

Reconstruction Finance Corporation—Summary of Activities Feb. 2, 1932, through Dec. 31, 1943

	Authorizations	Disbursements	Repayments and Other Reductions
For benefit of agriculture	$ 2,603,733,430.83	$ 1,452,180,464.11	$ 1,450,690,620.58
To open banks to meet demands of depositors	1,334,880,161.08	1,138,251,619.27	1,092,957,177.95
For distribution to depositors in closed banks	1,419,531,473.07	1,056,883,720.04	1,040,525,167.93
For bank capital (including Export-Import banks $176,500,000, and Federal Home Loan banks $124,741,000)	1,647,160,539.00	1,471,521,311.56	815,049,462.11
For self-liquidating projects (including PWA municipal securities)	1,297,532,465.62	1,072,390,065.85	957,046,102.78
To business enterprises	684,026,741.40	348,002,811.70	255,904,855.34
For loans to national defense	14,343,603,048.33	11,486,731,869.18	4,886,072,979.54
For loan to Great Britain and Northern Ireland	425,000,000.00	390,000,000.00	61,334,740.74
For purchases of stock—national defense	125,000,001.00	26,000,001.00	
To drainage, levee and irrigation districts	148,999,798.64	100,370,198.25	44,409,090.84
To railroads (including PWA railroad securities)	1,626,986,435.54	1,049,298,714.70	651,782,075.76
For loans to and capital of mortgage loan companies (including $25,000,000 capital the RFC Mortgage company and $11,000,000 capital Federal National Mortgage association)	887,342,930.95	735,582,073.01	560,517,059.54
For loans to and capital of insurance companies	151,589,750.19	137,843,209.81	105,605,282.73
To building and loan associations (including receivers)	179,874,559.59	139,898,067.90	136,698,246.85
To public school authorities	25,689,050.00	23,242,175.00	22,784,900.00
For catastrophe rehabilitation loans	16,184,520.95	12,003,055.32	11,347,543.65
To state funds for insurance of deposits of public moneys	13,087,715.88	13,064,631.18	13,064,631.18
For mining, milling and smelting businesses	19,019,100.00	8,989,409.40	3,748,883.38
For loan to Export-Import bank	25,000,000.00	25,000,000.00	25,000,000.00
For other purposes	669,057.07	614,813 85	614,813.85
Total—By directors of the corporation	$26,974,910,779.14	$20,687,868,211.13	$12,135,153,634.75
Allocations and loans to other governmental agencies and for relief by direction of congress	3,819,327,821.87	3,545,583,239.51	3,104,027,771.60*
GRAND TOTAL	$30,794,238,601.01	$24,233,451,450.64	$15,239,181,406.35†

*Includes $2,783,040,007.21 of corporation's notes cancelled pursuant to act of congress approved Feb. 24, 1938.
†Includes $46,724,308.14 credited on indebtedness for property taken over for debt.

administration July 15, 1943

The Rubber Development corporation was created by RFC on Feb. 20, 1943, for the purpose of developing sources of rubber outside of the United States. This organization was transferred to the Foreign Economic administration on July 15, 1943.

The Petroleum Reserve corporation was created by RFC June 30, 1943, to acquire petroleum, petroleum products and petroleum reserves outside the United States. It was transferred to Foreign Economic administration July 15, 1943.

The Federal Loan agency came into being through the president's reorganization plan No. 1, of April 25, 1939. Grouped under Federal Loan agency were the Reconstruction Finance corporation and its subsidiaries above mentioned and in addition the Federal Home Loan Bank board, Home Owners' Loan corporation, Federal Savings and Loan Insurance corporation, Federal Housing administration, Electric Home and Farm authority (now in liquidation) and Export-Import Bank of Washington (now a part of the Foreign Economic administration). In Feb. 1942 the activities of the Federal Loan agency were placed by executive order under the direction and supervision of the secretary of commerce for the duration of the war, with transfers of the Defense Homes corporation, Home Owners' Loan corporation, Federal Home Loan Bank board, Federal Savings and Loan Insurance corporation and the Federal Housing administration being effected to the National Housing agency. (C. B. H.)

Red Cross. **United States.**—Red Cross services and supplies, in 1943, were carried to every part of the globe occupied by United States troops. In Europe, North Africa, the middle east, India, Australia and the islands of the Pacific, thousands of specially trained Red Cross men and women—field directors, hospital, club and recreation workers—were by the side of the fighting men. They accompanied invasion forces into new combat areas or followed close behind—always within earshot of cannon fire. In continental United States and insular possessions there were other thousands of Red Cross workers on duty in camps and naval stations and military hospitals. Their number was being constantly augmented to keep pace with expansion by the army and navy.

The number of overseas Red Cross service clubs, rest homes and recreation centres grew to 350 during 1943. An innovation was the clubmobile, a bus equipped as a clubroom which solved the problem of bringing Red Cross services and supplies to remote camps and outposts in Great Britain, North Africa, Sicily, Italy, Australia and other places. The demand of army and air force officers for more frequent visits by Red Cross clubmobiles to their camps and airfields led to the inauguration of a new service—aeroclubs and camp clubs. Still another development during the year was the establishment of rest homes for aviators in need of relaxation after they had been on many bombing missions.

Important as were these activities for the able-bodied, far more vital was the service to the sick and wounded servicemen in the military hospitals at home and overseas. In the war zones, Red Cross hospital workers shared the hardships and risks with the nurses, doctors and patients. Hospital service and the work performed by field directors constitute the basic services of the Red Cross in this war. Field directors were available to servicemen and women everywhere.

Millions of Americans served their country on the home front as volunteer Red Cross workers. There were 4,000,000 workers in volunteer special services alone. They made 12,000,000 garments and 2,500,000 kit bags for uniformed men and women, and rolled more than 900,000,000 surgical dressings. They drove cars, ambulances and trucks in city, country and army camp. They served many thousand mass emergency meals to troops and civilians, and worked as typists, clerks and utility helpers in Red Cross and other war aid centres.

During 1943 the U.S. Red Cross enrolled about 27,000 nurses for service in the army and navy nurse corps. A hundred thousand trained volunteer nurse's aides served in veterans' and civilian hospitals. About 400,000 women and girls were taught Red Cross home nursing, while an expanding nutrition program helped strengthen the home front.

More than 17,000,000 members of the American Junior Red Cross produced millions of comfort and recreation articles ranging from hospital tray favours to furniture for army recreation rooms.

Of the more than 1,500,000 Red Cross first aid certificates issued in 1943 to persons who completed a prescribed training course, a large percentage went to war plant workers in every part of the country.

During the year, the Red Cross blood donor service grew to a nation-wide project with 35 blood donor centres and 63 mobile units, collecting approximately 100,000 pints each week. More than 4,000,000 donations were made through the Red Cross during the year, bringing the total donations to more than 5,000,000 from the time the service was inaugurated at the request of the surgeons general of the army and navy in 1941. The quota for 1944 was 5,000,000 pints.

The year 1943 saw the opening of four large packing centres in Philadelphia, New York, Chicago and St. Louis for the packing of Red Cross food parcels for American and Allied prisoners of war. In these plants 4,000 women volunteers packed nearly 7,000 Red Cross standard food packages. They were consigned to the International Red Cross committee at Geneva, Switzerland, for distribution principally in Europe. In Sept. 1943, the diplo-

matic exchange ship "Gripsholm" sailed from New York carrying a cargo of food packages, medicines and other supplies valued at $1,500,000 for the United States and Allied prisoners of war in the far east. An *American Red Cross Prisoner of War Bulletin* of which 100,000 copies were issued each month was launched during 1943. So was another publication, the *Red Cross News*, printed in small type on onion skin paper and sent by air through the International Red Cross committee to Americans in prison camps in Europe.

In March 1943, the Red Cross filed over 6,000 claims for veterans' pensions. Six months later the number had jumped to 25,000 a month. Requests for Red Cross assistance in filing claims for government benefits continued to increase in proportion to the number of men discharged from military service. The bulk of cases handled by Red Cross were filed for servicemen by Red Cross field directors attached to army and navy hospitals in the United States. When men were discharged from hospitals and returned to their homes, Red Cross chapters took over the responsibility of aiding veterans and their families who were in need during the period pending settlement of claims for government benefits.

All chapters maintained their service units in readiness to meet natural disasters of all types—windstorms, floods, fires and famine—and to assist local emergency defense councils with civilian aid in case of enemy action. Rehabilitation was offered to those victims who, through their own resources, were unable to recover from the effects of disasters. (G. S. Br.)

The World.—The 63 national Red Cross societies and their two international organizations, the International Red Cross committee and the League of Red Cross societies, found increased opportunities for service in a world at war.

Information was exchanged between national societies through the Geneva headquarters of the League of Red Cross societies—the federation of the national Red Cross and Red Crescent societies. The League's secretariat sent missions to societies both in Europe and in the western hemisphere, and through its publications encouraged the development and expansion of national activities. The League's Pan-American bureau, with headquarters in Santiago, Chile, supplied materials and advice to the societies of Latin America, and arranged field visits to extend disaster relief and nursing programs.

The International Red Cross committee continued to discharge its basic wartime responsibility as a benevolent neutral intermediary between belligerents. Through its headquarters in Geneva, Switzerland, continued to flow personal messages exchanged between civilians across enemy lines, bringing the wartime total of such messages by Sept. 1943, to over 3,000,000. The committee's delegates in warring nations visited prison camps, observed the application of the Geneva Prisoners of War Convention, and distributed relief supplies to prisoners and civilian internees. Ships operated by the international committee, sailing under safe conduct, carried relief supplies for prisoners of war on a regular schedule across the Atlantic, and the flow of such supplies through the committee's warehouses in Switzerland was larger than in any preceding year. Refugees. The year 1943 brought no surcease to the refugees trapped on the continent of Europe. When Germany occupied southern France in Dec. 1942, virtually all avenues of escape from Europe were closed. Inside Europe the deportations of Jewish refugees from the western countries to the east, which had been initiated by the Germans in Aug. 1942, in Paris, continued without abatement. At the end of the year 1943 it was generally accepted that practically all central European Jews, who had earlier sought haven in France and the Low Countries, had been shipped eastward along with many nationals of these countries.

Deportations were carried out with determination and ruthlessness. Families were separated, wives from husbands and children from parents. The old and infirm were collected along with others, first in concentration centres and then into deportation trains with minimum supplies of food and personal belongings. The deportations developed some resistance in the civilian population, particularly in France. Church groups, charitable institutions and individual families aided in hiding and protecting children especially, even at the risk of their own lives and security.

Concurrently with the deportations of Jews the recruiting of labourers for the war industries in Germany was intensified. The number of foreign involuntary workers drawn from other countries in Europe to Germany increased during the year to approximately 5,000,000. The ranks of the workers were increased substantially by the discharge of many Allied prisoners of war, who were immediately re-enlisted as civilian workers.

Even before the final closing of the borders of southern France at the end of 1942, the physically able among the refugees had established routes of illegal egress over the Pyrenees into Spain. At the beginning of the year some 15,000 refugees, predominantly French but including most of the nationalities of Europe, were in Spain endeavouring to make their way to north Africa or overseas to the western hemisphere. Their number was aug-

YOUNG FRENCH REFUGEE, son of a French war prisoner, enjoying a hearty meal at a home for refugee children in Geneva, Switzerland

mented daily by accretions of 50 to 100 who managed to cross the mountains even during the winter months at the beginning of 1943.

In North Africa the Allied occupation brought release and re-employment to some thousands of refugees who had escaped to that area earlier. Included were approximately 5,600 Spanish refugees, a small fraction of the estimated 120,000 caught in southern France by the German occupation. An Inter-Allied commission co-operating with the French authorities in North Africa arranged for their release from internment camps and immediate employment, chiefly in the labour corps of the Allied armies.

The persistent reports of mass executions of refugees in eastern Europe and of mounting death rates from starvation coupled with the complete stoppage of emigration from Europe resulted in public demands in the spring of 1943 in England and the United States for more effective governmental action on behalf of refugees.

In April 1943 the Anglo-American conference met in Bermuda to consider the problem. Recommendations were made to the American and British governments that the membership of the Intergovernmental Committee on Refugees, organized as a result of the Evian conference called by President Roosevelt in 1938, be enlarged and that its scope be extended to include authority to act on behalf of all refugees wherever they might be found, who had been obliged to leave their homes during the war for reasons of race, religion or political belief. This reorganization of the Intergovernmental committee and the extension of its mandate was accomplished at a meeting of the committee in London in Aug. 1943.

Hopes aroused by the Bermuda conference that intergovernmental action might result in the removal to neutral countries—Sweden, Switzerland, Spain and Turkey—of larger numbers of refugees from the occupied areas were doomed to disappointment. In spite of repeated efforts directed particularly to the rescue of children from Bulgaria and Rumania the exits of axis Europe remained closed to the refugees. The single exception was in the escape to Sweden of some 6,000 refugees from Denmark upon the German occupation of that country in the fall of 1943. Over 1,000 Danish Jews had previously been deported to the east.

The neutral countries had generally received refugees who crossed their borders clandestinely. Switzerland had accepted over 20,000 refugees from France and Germany, and Sweden some 20,000 Finnish children, more than 15,000 refugees from Norway and 4,000 from Germany. These were in addition to numbers of military refugees from France and Norway.

The movement of Polish refugees through Iran and India to temporary camps in east Africa and Mexico probably constituted the largest movement of refugees outside Europe during 1943. Some 33,000 Polish refugees had trekked in 1942 from eastern Poland through Soviet Russia to Tehran. From there they were transferred to Karachi and Bombay, India. More than 1,200 were removed by boat to Palestine. During 1943, 21,000 were placed in camps in Uganda, Kenya and Tanganyika; 1,500 were transported across the Pacific to Mexico to await repatriation to Poland after the war.

Smaller numbers of Greek refugees found asylum in the near east, 5,000 on the island of Cyprus, 2,000 in Syria, 2,000 in Egypt, 1,000 or more in Ethiopia and others in temporary camps in east Africa and the Belgian Congo.

The withdrawal of Italian troops from southern France following the collapse of Italy in the fall of 1943 precipitated a new movement of refugees into Switzerland. Central European refugees, previously comparatively safe in the Italian occupied zone of southern France, joined others from northern Italy and Italian military personnel to increase the refugee group in Switzerland to approximately 63,000. There were repercussions to the changed status of Italy in the war also in the near east. Greek refugees, some of Italian nationality, numbering over 10,000 fled from Samos and other islands relinquished by Italian troops to Palestine and Syria.

The refugee situation in the far east did not change substantially during 1943. The westward movement from central and eastern China continued at a slower pace. Estimates of the numbers of persons involved indicated displacements comparable to those in Europe. The war in the southern Pacific uprooted many overseas Chinese who fled from Burma, Malaya, Thailand, the Netherlands Indies and French Indo-China to Australia, India and China.

On Nov. 9, 1943 the representatives of 44 nations signed an agreement at Washington establishing the United Nations Relief and Rehabilitation administration. At the first session of the council of the new international relief organization which followed immediately at Atlantic City, New Jersey, the discussion of the problems of displaced persons in Europe and the far east clearly demonstrated the concern of governments to find early solutions for their uprooted populations. Rehabilitation and Occupational Therapy for Wounded Soldiers.

The medical rehabilitation of disabled ex-members of the armed forces in the 94 hospitals of the Veterans' administration in operation in 1943, supplemented the efforts of the internist and surgeon by an integrated program of physical therapy, occupational therapy, physical exercises, recreation and library activities. Group therapy was conducted for mentally ill patients whose condition unfitted them for individual assignment to an occupational therapy project.

Physical Therapy.—Physical therapy was extensively employed in the treatment of subacute and chronic conditions and in the restoration of impaired function. There were 95 physical therapy units in field stations of the Veterans' administration: 51 in hospitals for medical and surgical disorders, 29 in hospitals for neuropsychiatric patients, 13 in hospitals for tuberculous beneficiaries, and 2 in regional offices. Each unit was centrally located, completely equipped with modern appliances, and well lighted and ventilated. A physician was in charge of each, and the technicians under his direction were specially trained for this work.

The physical therapy measures used in the three different types of hospitals varied considerably. In all of them thermotherapy, massage, active and passive exercises, ultra-violet rays, galvanic, faradic and sinusoidal treatments were available. Hydrotherapy rooms were installed in the hospitals for medical and surgical and for neuropsychiatric patients, and were equipped with electric light cabinets, control table, shower, arm and leg whirlpool baths and sitz baths. Continuous flow tubs and pack rooms and swimming pools were provided for disturbed psychotic patients. In the hospitals for neuropsychiatric beneficiaries a well developed program of physical exercise and recreation was carried on by physical directors. The hospitals for tuberculous patients were equipped for heliotherapy—by solariums, indoor and out, and mobile ultra-violet ray lamps. Mineral baths were available at

the hospital in Saratoga Springs, N.Y.; and at a Florida facility (Bay Pines), the beach and warm water were used for heliotherapy and exercise.

Because the great preponderance of the beneficiaries were men who served in World War I, the physical measures employed were gradually modified to accord with their average age and its attendant disorders. The incidence of arthritis and peripheral vascular diseases naturally increased, and special facilities for their treatment were amplified. Fever therapy was employed as required.

The admission of patients from the armed forces in World War II, which was expected to accelerate greatly, would give renewed impetus to physical therapy.

Occupational Therapy.—Occupational therapy had an exceptional development under the Veterans' administration. As the name signifies, it was primarily a treatment measure, organized and administered for that purpose. It was prescribed and supervised by physicians. Any vocational training that might accrue, although considerable, was regarded as incidental and secondary. Occupational therapy projects were assigned only after careful consideration was given to the interest and aptitudes of the patients concerned, and to their physical, mental and emotional condition. Although many of the activities in occupational therapy had direct relation to the maintenance requirements of the hospitals where they were carried on, the assignments were never thought of as "work." There was consistent adherence to the administration's concept and definition of occupational therapy as "any mental or physical activity that is prescribed for, directed, and supervised to promote recovery from disease or injury, and to aid in the hospital or extramural adjustment of patients."

Besides the projects in arts and crafts conducted in hospitals for general medical and surgical, tuberculous and neuropsychiatric patients, occupational therapy projects of the industrial type also were carried on in connection with the fabrication and repair of pajamas, mattress covers, cooks' aprons, neckerchiefs, bedshoes, brushes, brooms, toothbrush cabinets, cement blocks, dustpans, tub-hammocks and covers for continuous flow tubs, repairs to library books, mops, rubber mats, printing and mimeographing, shoe repairs, head bands, shoeshining boxes, typewriter desks, venetian blinds, dishwashing racks, window drapes, raffia hats, linen trucks, library trucks, laundry trucks, convalescent gowns, wristlets, restraint belts, rubber pillowcases, furniture repairs and other repairs. Projects in landscaping, vegetable gardening, general agriculture and other outdoor activities were used and emphasized whenever this type of treatment could be utilized to advantage.

Habit-training and kindergarten types of occupational therapy for mentally deteriorated patients were further developed and extended in the neuropsychiatric facilities, under occupational therapy personnel with special training and experience in this type of treatment. Co-ordinated with this were the activities resulting from programs of recreational therapy, group therapy and physical exercise.

Reinhardt, Max (1873–1943), U.S. theatrical producer, was born Sept. 9 in Baden, near Vienna. Reinhardt, whose staging of *The Miracle* made him internationally famous as a producer, left Berlin in 1933 after nazi officialdom ousted him from the German State theatre because of his Jewish birth. Almost penniless, he went to the United States, where he staged the Hollywood production of *A Midsummer Night's Dream*, 1935. At the time of his death he was supervising the production of *La Belle Hélène* for the New Opera company and a successful revival of his production of the operetta, *Rosalinda*, had entered its second year on Broadway. Reinhardt, who became a naturalized U.S. citizen in 1940, died in New York city, Oct. 31. (See *Encyclopædia Britannica.*)

Relief. The outstanding fact in the field of relief in 1943 was the great demand for workers in all belligerent countries, so insistent that every able-bodied person could get a job, if free to take it, and the need was so urgent that persons on the old-age assistance rolls left to take jobs, mothers or guardians of small children made special arrangements for the care of their children so they might accept positions and even some of the blind were drawn into wage earning.

The number of the unemployed in the United States dropped to an altogether unanticipated low of less than 1,000,000, as against a theoretical minimum of 2,000,000 which had been assumed as the ultimate reduction possible in that category. Those who had been freely stigmatized as shirkers and paupers on work relief projects, such as the Works Progress administration, were in 1943 working in defense industries, absorbed in the military services or otherwise risen to the ranks of independence, leaving only the physically and mentally handicapped, the aged and children with their guardians on the relief rolls.

Up to the middle of 1942, assistance to the aged in the United States had increased from about 500,000 recipients in 1936 to about 2,250,000 in July 1942, aid to dependent children from about 110,000 families to 386,000 and aid to the blind from about 57,000 to 78,000. After July 1942, all these trends not only had ceased to continue in their upward direction, but had actually been reversed, the least pronounced being among the blind and the most among families with dependent children.

In the class of general relief, the unemployables and the unemployed not cared for by the above provisions, the decrease in total number receiving assistance began earlier, as industrial conditions began to absorb the unemployed. In Jan. 1940, it stood at about 1,600,000 families and dropped to only slightly more than 300,000 cases in the fall of 1943.

As the number of cases decreased, certain changes in character of cases and in methods of administration emerged. Obviously, everyone capable of securing a job was off the rolls, and therefore those left presented more difficult problems. Services looking toward rehabilitation occupied a larger share of the attention of public and private assistance workers than ever before. A substantial number of states in the United States placed their general relief grants on a cash basis to families, as it had been in the special categories such as aid to the blind, the aged and dependent children.

Contributions to community funds, or to war chests continued to rise in Canada and the United States as they had in 1942. In Canada 15 chests collected $4,895,385 in 1943 as compared with $3,777,058 in 1942. In the United States 247 war chests raised in 1943 $118,438,178, compared with $101,633,241 in 1942. There was no solicitation for funds for the Red Cross in the United States in 1942; but in 1943 a special appeal, largely for relief due to World War II, was made for $125,000,000, and more than $141,000,000 was raised. These substantial increases in contributions to private agencies in the two English-speaking countries of North America were in the face of drastically increased taxation, draining off excess profits of corporations and extra earnings of individuals. They cannot be offered as conclusive evidence of the confidence which these private agencies enjoyed, but they are valid evidence that high taxes did not reduce the willingness,

or perhaps the ability, of corporations and persons to give in a period of high industrial activity and its sequential widely spread improvement in the income of workers.

The publication of *Social Insurance and Allied Services in England* by Sir William Beveridge in England, and of the *Report of the National Resources Planning Board* in the United States in the latter part of 1942 broke new ground in the theory and administration of public assistance. While both documents were interested primarily in insurance provisions whereby wage earners might be adequately protected in old age, illness, invalidity, unemployment and the other predictable contingencies which reduce them to dependence, each recognized that all plans for the anticipation of need by insurance or other means must envisage a general assistance program capable by its flexibility and adequacy of caring for those whose needs do not fall within the anticipated categories. The Beveridge report said, "The State cannot be excluded altogether from giving direct assistance. However comprehensive an insurance scheme, some . . . will fall through the meshes of any insurance." For this residual group he proposed a national assistance program, based on the means test, with aid somewhat less adequate than insurance benefits, but with no requirements as to residence as a criterion of eligibility.

The National Resources Planning board (U.S.) made practically the same recommendations, modified only by the governmental structure of the United States, which places ultimate responsibility for public assistance upon the different states. The device used by the federal government to bring about uniformity in benefits and public assistance within the more than 50 jurisdictions was to offer grants-in-aid for assistance, among other purposes, conditioned upon the states' meeting certain conditions. It recommended that the system of categorical assistance be enlarged to include all assistance, granted without reference to the residence of the applicant within the jurisdiction in which he becomes dependent. This report, however, followed the precedent of the United States in recommending provision for a flexible work relief resource for the unemployed, which English policy discarded over a half century ago.

The reception of these reports in the two countries was almost diametrically opposite. In England all parties, Tory and Labour alike, urged the adoption of the various provisions of the Beveridge report; the conservative group offered minor restrictive amendments which the liberal group opposed; but the divergence of opinion as to the wisdom of adopting it substantially as submitted was all but universally held. Contrariwise, the congress of the United States, on receipt of the report, immediately cut out the appropriation for the board's work and refused to consider its recommendations. The Wagner-Murray senate bill No. 1161 incorporated some of its recommendations into a proposed law; but only the most optimistic expected the bill to reach passage in the 78th congress. Religion. The emergence of religion of a diffused, popular sort, as a reflection of the vicissitudes of multitudes of people under the war stress, was unquestionably the outstanding development in the religious field in 1943. It appeared in the widespread resort to prayer by soldiers facing danger and by their families at home, in the appointing of special days for formal public prayer and in the vast outpouring of religious sentiment by the radio in response to sensitiveness to what the public wants. Much of this manifestation of religion was outside of churchly forms and matched the unconventional and "scrambled" religious ministries of war chaplains to soldiers of varying faiths.

The year was also marked by highly significant inter-faith action. A statement of fundamental principles for a postwar world order, issued in the United States by 38 Roman Catholics, including archbishops and bishops, 48 Jews and 48 Protestant leaders, marked a form of collaboration unprecedented for America. The declaration found basic common ground in the conviction that "a moral law must govern the world order," and theologians were putting new stress on the doctrine of a natural revelation of God expressed in all faiths and appealing to the consciences of Christians, Jews and pagans alike. This was the 1943 theme of the meeting of the American Theological society. The latest sessions of the Conference on Science, Philosophy and Religion continued to give respectful recognition to religion on the part of the intellectual world.

Even more significant was the realization by nations that religion is essential to their solidarity and peace. The White Paper setting forth the British government's plans for educational reconstruction indicated

> a very general wish that religious education should be given a more defined place in the schools, springing from the desire to revive the spiritual and personal values in our society and in our national practices. . . .

"We are concerned," the White Paper continued, "to see preserved, or born, a genuinely Christian civilization . . . one in which the Christian belief in God and all that is derived from it . . . shall set the tone of society."

Easily the most spectacular event of the year in the religious world was the reversal of Russian policy which permitted and regularized the election of the Metropolitan Sergei as patriarch of the Russian Orthodox Church, after a hiatus in that office for nearly 20 years, due to the government's opposition to religion. This move apparently assured freedom of religious worship, especially for the recognized church, and probably also some provision for theological education and a limited amount of publication; it did not mean general freedom of religious education or propaganda. Even so the government's action was a clear recognition of the integral place of the church in the social and cultural life of the Russian people.

The failure of this more liberal policy to include the Russian minority religions—some of which are akin to certain strong American denominations—together with the continued suppression of minority churches in many totalitarian countries and the renewed tension between Roman Catholic and Protestant churches with respect to missions in Latin America, combined to bring the matter of religious freedom to the fore in church circles. A tentative demand was voiced for the inclusion of a "charter of religious liberties" in the formal treaty agreements under which the postwar world was expected to be reconstituted.

The chief preoccupation of the churches' thinking during 1943 was with a group of Christian ethical principles on which they sought to mobilize world sentiment for the ordering of the postwar world, together with practical measures of reconstruction for religious institutions throughout the world which had been damaged or destroyed by war. The effort to develop a common Christian world view, through correspondence and exchange of papers by international commissions working under a co-ordinated plan through the World Council of Churches, only partly succeeded. It did not prevent the development of somewhat divergent trends of thought between the churches of the English-speaking world

on the one hand. and those, especially, of the European continent on the other.

Unhappily the heightened sense of religion's responsibility for its world task, together with a certain rivalry with respect to the control of funds, occasioned a fresh flare-up in several denominations in the United States of the controversy between "fundamentalist" groups and the more moderate majority party in control of the churches. This threatened disruption of the agencies of certain denominations, caused numerous local congregations to cease to co-operate with their denominations and led to the organization of a nonecclesiastical national fundamentalist organization seeking to duplicate the Federal Council of Churches.

A compilation of nation-wide religious statistics for the 1943 *Yearbook of American Churches* showed that church membership increased faster than population and that the churches included in their membership a larger portion of the population of the U.S. than ever before. A challenging revelation of these statistics was the fact of the extraordinary growth, relative to the longer-established churches, of the emotional sects. Generally speaking, these expected the speedy return of Christ to earth, sought holiness through a radical break with the world and claimed supernatural gifts of speech, healing, etc. Thirty-four denominations of this type increased their memberships after 1926 four times as fast as the old-line churches. In spite, however, of their very great rate of gain, the irregular denominations all told constituted not more than 5% of the total church membership of the nation. Republican Party.

The Republican party subscribed to a program of full United States co-operation with other democratic and peace-minded nations in the postwar era.

The minority members of congress supported all measures for effective prosecution of the war against the axis, but they frequently combined with conservative Democrats to reject administration proposals dealing with domestic questions. With 208 members in the house and 38 in the senate for the first 10 months of the year, the G.O.P. exerted more influence in national affairs than it had in a decade.

The Republicans formally charted their course in both foreign and domestic fields when their Postwar Advisory council staged what amounted to an off-year, party convention at Mackinac Island, Michigan, on Sept. 7, 1943. That body adopted these main principles with respect to the war and eventual world reorganization:

1. Prosecution of the war by a united nation to conclusive victory over all our enemies, including
   (a) Disarmament and disorganization of the armed forces of the axis;
   (b) Disqualification of the axis to construct facilities for the manufacture of the implements of war;
   (c) Permanent maintenance of trained and well equipped armed forces at home.
2. Responsible participation by the United States in postwar co-operative organization among sovereign nations to prevent military aggression and to attain permanent peace with organized justice in a free world.

The G.O.P. formally underwrote these pledges when the minority representation voted overwhelmingly for the Fulbright resolution in the house and for the Connally resolution in the senate. The Fulbright resolution was adopted by a vote of 360 to 29, with

OPENING SESSION, Sept. 6, 1943, of the Republican Postwar Advisory council at Mackinac Island. At the conference, 43 delegates, including 18 state governors, approved a compromise declaration favouring U.S. participation "in postwar co-operative organization . . . through regular constitutional channels"

three Democrats and 26 Republicans in opposition.

Five senators opposed the Connally pronouncement. They were Hiram W. Johnson of California, William Langer of North Dakota, Henrik Shipstead of Minnesota, Burton K. Wheeler of Montana and Robert R. Reynolds of North Carolina. Although the first three are listed as Republicans, they have never been classified as regular party men.

The Fulbright resolution declared that "the congress hereby expresses itself as favouring the creation of appropriate international machinery with power adequate to establish and maintain a just and lasting peace among the nations of the world, and as favouring participation by the United States therein through its constitutional process."

The Connally declaration paraphrased the house edict, but it also included the following paragraph from the agreement negotiated at Moscow on Nov. 1, 1943, by the foreign ministers of the United States, Great Britain and Russia:

> Resolved that the senate recognizes the necessity of there being established at the earliest practicable date a general international organization, based on the principle of sovereign equality of all peace-loving states, and open to membership by all such states, large and small, for the maintenance of international peace and security.

The Mackinac convention, however, condemned the administration's domestic program. After advocating greater encouragement of "private enterprise" and postwar "termination of rationing, price-fixing and all other emergency powers," the advisory council said:

> The present program of the New Deal administration, with the enlargement thereof set forth in the reports of the National Resources Planning board, would wreck the country because the only remedy it proposes is unlimited government spending of borrowed money. It would socialize business, agriculture and the professions. It would extend the power of government until ultimately no man or woman could act, write or speak without approval. It would substitute for American liberty the regimented existence of a subject people.

The Mackinac meeting named the following study committees and chairmen: Foreign Policy and International Relations—Senator Arthur H. Vandenberg of Michigan; Postwar Enterprise, Industry and Employment—Governor John W. Bricker of Ohio; Social Welfare and Security—Governor Earl Warren of California; Finance, Taxation and Money—Senator Robert A. Taft of Ohio; Reform of Government Administration—Governor Thomas E. Dewey of New York; Labour—Representative Charles A. Halleck of Indiana; Agriculture—Senator Charles L. McNary of Oregon; International Economic Relations—Representative Daniel A. Reed of New York.

Senator McNary continued as Republican senate leader, and Representative Joseph W. Martin Jr. of Massachusetts remained as house minority leader.

Harrison E. Spangler of Iowa headed the Republican National committee, devoting full time to the job—the first occupant of the post to do so in many years. He placed the headquarters on an all-year-around basis, whereas in the past it had been inactive except for a few months before congressional or presidential elections.

Representative J. William Ditter of Pennsylvania, who was killed in an aeroplane accident on Nov. 21, 1943, was succeeded as chairman of the Republican Congressional committee by Representative Halleck. Former Senator John G. Townsend Jr. of Delaware was reappointed chairman of the Republican Senatorial committee. (*See* also UNITED STATES.) (R. TU.)

Rhode Island. A north Atlantic state of the United States, in New England; one of the 13 original states; popularly known as "Little Rhody." Area, 1,214 sq.mi. (smallest of the United States); pop. (1940) 713,346. The urban population was 653,383 (91.6%). Capital, Providence (253,504). Other cities include Pawtucket (75,797); Woonsocket (49,303); Cranston (47,085); Newport (30,532); Warwick (28,757); Central Falls (25,248).

History.—At the regular 1943 session of the legislature, leading measures passed included the following:

An act authorizing the governor to shorten the business week because of the fuel shortage; an act extending the governor's emergency war powers for a year; an act providing for military leaves and separation pay for certain persons employed in the service of the state; an act exempting residents of the state from the payment of interest on delinquent property taxes while such residents are in the military or naval service of the United States; an act providing penalties for an employer who refuses to restore a job to a member of the armed services if the member applies within 40 days of discharge and the employer is in a position to rehire him; an act appropriating $20,000 to establish canning centres in various parts of the state to tie in with the food conservation program; an act creating a commission to study the matter of bonuses for men and women now in the armed services; an act authorizing inmates of the state prison to participate in war production; an act freezing unemployment compensation credits of Rhode Islanders in the armed services until two years after the war; an act relating to hours and conditions of employment of women and minors—chiefly restricting employment of minors under 16 years of age; an act allowing employees to draw cash sickness insurance benefits even though they are paid for absences by their employers; an act empowering the governor to lower cash sickness benefits and reduce the number of payments in the event of an epidemic or other emergency; an act creating a second injury indemnity fund; an act setting up a curative centre for injured workmen; an act making appropriations of $17,759,970.06 for the support of the state for the fiscal year ending June 30, 1944; an act increasing from 3% to 4% the excise tax on financial institutions; an act placing a tax ceiling of 27.5 cents on each $100 of deposits in savings banks and a tax ceiling of 10 cents on each $100 of deposits in credit unions, but granting credit unions a $100,000 exemption, plus exemptions on loans to members; an act revising the unincorporated business tax so that businesses will pay $1 per $1,000 on gross receipts over $5,000, excepting wholesalers who will pay 50 cents on $1,000; an act authorizing cities and towns to set up reserve funds to be spent on capital expenditures after the war; an act authorizing the city of Providence to create the office of budget director; an act relative to the assignment of accounts receivable; an act allowing theatres in several communities to open an hour earlier on Sunday; an act regulating the practice of electrolysis and providing for licences therefor; an act regulating the sale, distribution and use of biological products; an act opening a specific area of the Sakonnet river to power dredging and providing for the opening of a comparable substitute area in Narragansett bay when the Sakonnet river is over-fished; an act to provide for the conservation of soil and soil and forest resources and the prevention and control of erosion; an act creating a state board of inspection of horse riding schools and defining its powers and duties.

The chief executive officers of the state, all re-elected in Nov. 1942 for 1943–44 were: J. Howard McGrath, governor; Louis W. Cappelli, lieutenant governor; Armand H. Cote, secretary of state; John H. Nolan, attorney general; Russell H. Handy, general treasurer. In the 1942 gubernatorial election, McGrath (Dem.) received 139,407 votes; McManus (Rep.), 98,741. Edmund W. Flynn was chief justice of the supreme court.

Education.—During 1942–43 there were in the public elementary schools 60,216 pupils and 2,115 teachers; in junior high schools 20,954 pupils and 933 teachers; in senior high schools (three years) 15,581 pupils and 754 teachers; in senior high schools (four years and vocational) 4,809 pupils, of whom 551 were vocational, and 204 teachers.

Public Welfare, Charities, Correction.—The total number of persons receiving relief in all categories (excluding incapacitated fathers) in Nov. 1943 was 15,266, or about 2.1% of the state's 1940 population. The total amounts paid out during the year Dec. 1, 1942–Nov. 30, 1943, were as follows: general public assistance $929,142; soldiers' relief $68,478; old-age assistance $2,357,732; aid to dependent children $828,335; aid to the blind $28,717. In unemployment compensation, the gross amount of benefits paid during 1943 was $1,350,400.09 to 11,577 different individuals. The amount paid into the fund during 1943 was $15,081,868.92. There were 785 inmates in correctional institutions in Oct.-Nov. 1943, and 4,724 patients in charitable institutions and institutions for defectives.

Communication.—The total mileage of highways on Dec. 31, 1943 (excluding city streets), was 2,680.86, of which the state highway system comprised 806 mi. At the close of the year 1942 railroads were operating 185.9 mi. of road, and electric railways 78.504 mi. Water-borne commerce of the state for 1941 was 7,220,697 tons of which 530,970 tons were foreign commerce (imports, 370,156 tons; exports, 160,814 tons) and 6,689,727 tons were coastwise (receipts, 5,982,731 tons; shipments, 706,996 tons). Airways totalled 120 mi.; there were one airport and two landing fields. In Jan. 1942, there were 138,762 telephones in service.

Banking and Finance.—There were 35 banking institutions in 1943. Resources of 23 banks under state supervision totalled $563,172,899.46 and of 12 banks under federal supervision, $223,642,649.75. Savings deposits (exclusive of club accounts) in sav-

ings banks and trust companies (the 23 state banks) amounted to $343,644,438.31 on June 30, 1943. In addition, six loan and investment companies had resources of $8,103,032.50; eight building and loan associations, $47,007,889.87; 23 credit unions, $6,090,953.59.

At the close of the fiscal year, June 30, 1943, total state receipts were $22,979,600.22; expenditures and encumbrances $20,168,056.75; surplus from operation $2,811,543.47. The state gross debt was $28,363,000; net debt $22,633,254.66.

Agriculture.—The total estimated value of agricultural production was $15,984,000 in 1943 and actual value was $15,704,000 in 1942. Total acreage harvested was 50,000 in 1943. Cash income from crops in 1943 was $4,064,000; from livestock $10,820,000; from government payments $100,000, a total of $14,984,000.

Leading Agricultural Products of Rhode Island, 1943 and 1942

Crop	1943	1942
Corn for grain, bu.	39,000	42,000
for silage, tons	57,000	57,000
Hay (tame), tons	45,000	49,000
Alfalfa, tons	2,000	2,000
Potatoes, bu.	1,085,000	975,000
Oats, bu.	31,000	34,000
Apples (commercial), bu.	281,000	332,000
Peaches, bu.	1,000	16,000
Pears, bu.	4,000	6,000
Grapes, tons	150	200
Livestock and Livestock Products		
Cows and heifers, 2 years and over	23,000	23,000
All cattle and calves	29,000	29,000
Hens, 3 months and over	548,000	504,000
Sheep and lambs	2,000	2,000
Hogs	8,000	7,000
Milk produced, lb.	135,000,000	140,000,000
Eggs produced, doz.	5,900,000	5,800,000
Chickens raised, no.	1,100,000	908,000
Turkeys raised, no.	26,000	25,000

Manufacturing.—The total estimated value of manufactures was $516,390,541 for 1939 and $517,196,193 for 1937. Employment in 1939 totalled 106,269 wage earners and 12,005 salaried personnel. The number of establishments was 1,460. Wage earners received $105,406,950 and salaried personnel $27,940,576. (Figures for 1943 were not obtainable from bureau of the census). Report of state department of labour for Dec. 1943, showed 84,463 wage earners and weekly payroll of $3,217,584 with a statement that survey covered over 75% of total number of wage earners employed in all manufacturing industries in Rhode Island.

Mineral Production.—The value of mineral production in Rhode Island is small, exceeding only that of Delaware and the District of Columbia. Value in 1939 was $980,916; in 1940, $994,997. Stone ($558,944 in 1939 and $511,620 in 1940) and sand and gravel ($265,631 in 1939 and $333,612 in 1940) are the principal products. Production of stone reached 320,780 tons in 1939 and 201,380 tons in 1940; sand and gravel 383,557 tons in 1939 and 515,129 tons in 1940. (M. C. ML.)

Rhodesia. The territory extending from the Transvaal border northward to the boundaries of the Belgian Congo and of Tanganyika Territory. It is bounded on the east by Portuguese East Africa, Nyasaland and the Tanganyika Territory, and on the west by Belgian Congo, Portuguese West Africa and Bechuanaland. Area 440,656 sq.mi.; comprises two territories of the British empire; viz., Southern Rhodesia and Northern Rhodesia. Southern Rhodesia is a self-governing member of the British commonwealth, but supervision over native rights is reserved to the imperial government. Northern Rhodesia remains a dependency of the crown. Certain essential statistics are given in the accompanying table. (*See* also BRITISH EMPIRE.)

Rhodesia

Territory and Area in sq. mi.	Principal Products	Imports and Exports (in thousand £)	Road and Rail	Revenue and Expenditure (in thousand £)	Education: Elementary and Secondary 1938
NORTHERN RHODESIA 290,323	copper (smelter production 1939) 215,100 metric tons (export 1940) copper, blister, £7,452, 644 copper, electrolytic, £1,270,638	(1941) imp. 5,639 exp. 10,937	(1940) All rds. 8,775 mi. rly. 629 mi.	(est. 1942) rev. 2,657 exp. 1,919	Eurpn. schls., 18, schlrs., 1,320; African schls., 431, schlrs., 35,570
SOUTHERN RHODESIA 150,333	(1941) maize 118,475 metric tons coal 1,874,975 tons gold 790,442 oz.	(1941) imp. 9,829 exp. 15,395	(1941) Main rds. 1,621 mi. rly. 1,361 mi.	(est. 1942-43) rev. 7,050 exp.: ord. 4,335 war 4,106	(1941) Eurpn. schls., 78, schlrs., 11,106; Asiatic and coloured schls., 12, schlrs., 1,734; native (1940) schls., 1,302, schlrs., 111,686.

History.—Intensive production in both Rhodesias of crops and basic metals in 1943 accentuated the shortage of African labour. Both territories enjoyed considerable prosperity, but costs of living rose owing to the limitation of imports. The financial position improved considerably; Southern Rhodesia was able to offer Great Britain a loan of £3,000,000 free of interest, and the revenue of Northern Rhodesia showed a large surplus at the beginning of the year.

Southern Rhodesia.—In June the Southern Rhodesian parliament passed a bill to prolong its life for 12 months to avoid a general election. On the appointment of R. C. Tredgold as high court judge, Captain Bertin was appointed minister of justice in his place, and Sir G. Huggins took over the defense ministry. Captain Bertin was responsible for internal security and internment and refugee camps. Professor Wallis, who was appointed editor of archives, was to publish a series of volumes of historical documents of Rhodesian history under a scheme financed by Sir Ernest Oppenheimer to be known as the "Oppenheimer Series." The 50th anniversary of the occupation of Matabeleland was celebrated by the issue of a special postage stamp. Many more Rhodesians were joining the forces; numbers were serving in the Black Watch, the Cheshires and in other well-known British regiments. A battalion of Rhodesian African rifles was added to the East African command, comprised chiefly of Matabele and Mashona. Much attention was being paid to the encouragement of sound farming; a subsidy was paid for maize grown according to approved methods.

Northern Rhodesia.—The rationing of food and other commodities was avoided, but supplies of articles for native consumption were scarce and efforts were made to increase imports. A river route opened through Lake Bangweulu facilitated transport of supplies to the northeastern districts. A state maize-growing project to increase production was rejected owing to difficulties of equipment and labour. A meat cold-storage plant was opened in Livingstone to assist the cattle industry. Copper production during the first nine months of 1943 exceeded that for the same period in the previous years and vanadium production increased by 15%. (J. L. K.)

Ribbentrop, Joachim von (1893–), German statesman, was born April 30 at Wesel on the Rhine and was educated at the gymnasium at Metz. In 1910 he went to Canada as an independent merchant. At the outbreak of war in 1914 he returned to Germany, enlisted in a Hussar regiment, advanced to lieutenant colonel and by the end of the war was attached to the war ministry. After the war he

returned to private business as a wine merchant. He first became identified with the nazi party as a worker in 1930. At his home in Berlin-Dahlem were held the important meetings that preceded Hitler's appointment as chancellor of the reich, Jan. 30, 1933. In 1935 Ribbentrop was appointed ambassador-at-large, and from 1936 to 1938 he was ambassador to Great Britain. He became foreign minister, Feb. 4, 1938, and from then on played a prominent role in the diplomatic manoeuvring that co-ordinated with German military operations. In 1939 he made the deal with Russia that kept peace until Germany was ready to invade. In 1940 he negotiated the three-power pact with Italy and Japan. From 1941 to 1943 he participated, with Hitler and others, in numerous conferences with leaders of satellite and conquered states

On Aug. 6, 1943, Ribbentrop went to Italy to confer with Premier Pietro Badoglio and Foreign Minister Raffaele Guariglia, but was unsuccessful in his effort to keep them lined up with the axis.

Rice, Cale Young (1872–1943), U.S. poet and dramatist, was born Dec. 7 in Dixon, Ky. He received degrees from Cumberland and Harvard universities and soon afterwards turned to writing as a career. He wrote two novels, *Youth's Way* (1923) and *Early Reaping* (1929), and numerous poetic and prose dramas. Among his 21 volumes of poetry are *From Dusk to Dusk* (1898), *With Omar* and *Song Surf* (1900), *Nirvana Days* (1908), *Many Gods* (1910) and *Far Quests* (1912). His poetic dramas include *Charles di Tocca* (1903), *David* (1904), *Yolanda of Cyprus* (1906), upon which an opera score was based, and *A Night in Avignon* (1907). He also wrote his autobiography, *Bridging the Years* (1939). He was the husband of the late Alice Hegan Rice, author of *Mrs. Wiggs of the Cabbage Patch*. Mr. Rice was found dead in bed in Louisville, Ky., Jan. 24, from a gunshot wound below the heart. A revolver was found beside him.

Rice. A crop of 70,025,000 bu. of rice in the United States in 1943 exceeded the crop of 1942, 64,549,000 bu., by 8% and the ten-year (1932–41) average of 47,334,000 bu. by 48%. The acreage was 1,500,000, much the largest on record and 10% above the goal set by the government for 1943. The yield per acre, 46.7 bu., was above 1942 and near the average of 48.4. The southern rice area produced nearly 56,000,000 bu. compared with 52,000,000 bu. in 1942. California produced about 14,200,000 bu., its largest crop on record owing to expanded acreage as well as favourable conditions. More machinery was used for harvesting and drying, offsetting the shortage of labour. The Arkansas and Louisiana growers suffered from water shortage early in the season followed by floods late in the season. Texas had a good crop except in the hurricane belt.

U.S. Production of Rice by States, 1943 and 1942

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
Louisiana . . .	23,908,000	23,370,000	California . . .	14,030,000	12,627,000
Texas	20,196,000	15,910,000	Arkansas . . .	11,891,000	12,642,000

Rice production in South America continued to increase under the stimulus of war demand. Brazil early in 1943 reported a large surplus for export though the total crop was not expected to exceed that of 1942 amounting to 14,700,000 bu. In 1942 a total of about 196,000,000 lb. was exported. Peru was reported in the fall of 1943 to have a crop of about 6,000,000 bu. for harvest compared with the small crop of 3,889,000 bu. of 1942. Efforts were made to expand the acreage of rice in Peru by improving the water resources. Ecuador was reported to have a crop of 7,300,000 bu. in 1943 compared with an average of 3,400,000 bu. for the five-year period 1936–40. Ecuador was the third largest exporter of rice in the western hemisphere, exceeded only by the United States and Brazil. Cuba's needs for rice amounting to about 460,000,000 lb. are supplied by imports from the United States and Ecuador.

Efforts to increase the crop in Cuba were not successful because of the scarcity of water for irrigation. Yields are low on dry lands.

The rice crop of China was reported as larger in the Free China areas, but some localities had poor crops and in late 1943 faced famine conditions. In India the failure of the crop because of storm damage, harvesting difficulties and other troubles resulted in a shortage in the Bengal area so acute as to have resulted in the starvation of several hundred thousand people.

(J. C. Ms.)

Richards, Laura Elizabeth (1850–1943), U.S. author, was born Feb. 27 in Boston, the daughter of Julia Ward Howe, author of the "Battle Hymn of the Republic," and of Dr. Samuel G. Howe, head of Boston's Perkins institution. Mrs. Richards embarked on a literary career by writing nursery rhymes for her children, which were published in 1873. She later wrote children's stories, the most famous of which is *Captain January* (1890). Collaborating with her sisters, she wrote a biography of her mother, *Julia Ward Howe*, 1819–1910, which was published in 1915 and won the Pulitzer prize for biography, 1917. Mrs. Richards also wrote a biography of her father in 1935. Her own autobiography, *Stepping Westward*, was published in 1931. She died at her home in Gardiner, Me., Jan. 14.

Rivers and Harbours. Federal improvement and maintenance of rivers and harbours and other waterway channels in the continental United States and its territories and island possessions are carried out by the corps of engineers, U.S. army, under the direction of the secretary of war and the supervision of the chief of engineers in accordance with the plans authorized by congress. Reports requested by congressional directives to ascertain the advisability of further improvements of this nature are also made by the corps of engineers. The water transportation facilities provided by these works are vital to the commercial and economic development of the United States in normal times and are of the utmost importance to the nation in time of war.

In conformity with national policy governing wartime construction in the interest of conservation of manpower, equipment and materials, the work program on river and harbour projects for navigation and allied purposes was restricted to improvements having direct importance to the war effort. Improvements and maintenance operations were carried out on 323 separate projects of which six projects were fully completed. During the fiscal year ending June 30, 1943, the principal items of new work operations included the continuation of dredging and rock removal in the Kennebec river from the mouth to Bath, Me.; removal of ledge rock and dredging in the main channel of Portland harbour, Me.; dredging of anchorage areas in New York harbour; dredging and rock removal in the Kill van Kull section of the New York and New Jersey channels; rock removal in the Delaware river channel leading from Philadelphia to the sea; bank protection work in the deep cut section of the Chesapeake and Delaware canal; enlarging channel dimensions in sections of the Sabine-Neches waterway; deepening of the final middle section completing the through waterway extending from Lake Michigan to Sturgeon bay, Mich.; construction of the Mac-

Arthur lock in the St. Mary's river at Sault Ste. Marie, Mich., which was completed during Aug. 1943; completion of the powerhouse extension at the Bonneville dam on the Columbia river, the tenth and final power generating unit having been placed in operation in Dec. 1943, adding 74,000 additional horsepower, and increasing the power capacity of the Bonneville multipurpose project to 518,400 kw.; completion of the initial power generating unit of 35,000 kw. capacity at Fort Peck dam, Mont., on the Missouri river, the production of power having commenced on July 1, 1943; widening of a section of the Cuyahoga river, Ohio, and enlargement of the turning basin; closing of the gap in the west breakwater at Oswego harbour, N.Y.; continuation of construction of the breakwater extension at Los Angeles and Long Beach harbours; and construction of a breakwater extending from Waadah island to the westerly shore of Neah bay, Wash.

In addition to the maintenance of channels previously completed, and the above-mentioned new work projects, important channel and harbour improvements were also effected on waterways and at ports on the Atlantic, Gulf, and Pacific coasts, on inland rivers, and on the Great Lakes. These included improvements at Weymouth Back river, Mass.; Providence river and harbour, R.I.; Connecticut river below Hartford, Conn.; Hudson river, N.Y.; Great Lakes to Hudson River waterway, N.Y.; Fishing creek, Md.; Norfolk harbour, Va.; Caloosahatchee river and Lake Okeechobee drainage areas, Fla.; Southwest pass and South pass, Mississippi river, La.; Mississippi river between the Missouri river and Minneapolis, Minn.; Missouri river from the mouth to Sioux City, Ia.; Ohio river; Allegheny river, Pa.; Manitowoc harbour, Wis.; Calumet harbour and river, Ill. and Ind.; Indiana Harbor, Ind.; Illinois waterway, Ill.; Buffalo harbour, N.Y.; San Pablo bay and Mare Island strait, Calif.; and Bodega bay, Calif. (*See* also AQUEDUCTS; CANALS AND INLAND WATERWAYS; DAMS; FLOODS AND FLOOD CONTROL.) (E. RD.)

Other Countries.—Ports play so important a role in war transport operations that secrecy in regard to their equipment and methods of exploitation was essential in World War II, and no information could be divulged in this regard.

That there was widespread activity during 1943 in the expansion of facilities at certain ports of strategical importance could not be doubted and it was well known that in the middle east, for instance, new ports and harbours were created and brought into commission, mainly for war purposes. "Camp X," for example, was the wartime designation of a modern seaport which arose during the year on a bay of the Egyptian coast, where the year before there was little more than desert sand, and it was typical of a number of new ports in various stages of development scattered along the coastline of the middle east.

To this active expansion of port facilities there was a counterbalance in the practical destruction (due to R.A.F. raids) of well known European ports, formerly of the highest trading importance. The fate of Hamburg, Naples, Genoa, and, in some lesser degree, a score of others was known.

Although port developments in actual progress in Great Britain cannot be discussed, allusion to postwar projects to be put in hand when circumstances were favourable is permissible. Quite a number of British ports had schemes under consideration, some of them of considerable magnitude. Notable among them were plans for the expansion and development of the harbours and docks at the ports of Dundee and Greenock. Both of these were set out fully in reports published in the press, particularly in *The Dock and Harbour Authority*, the scheme for Dundee in the June 1943 issue and the scheme for Greenock in the Sept. 1943 issue.

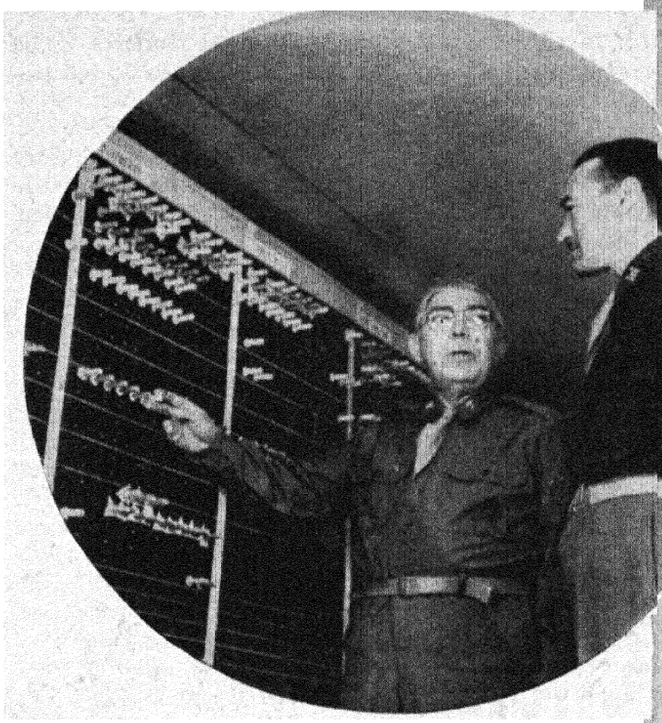
There was considerable activity at Marseilles, where a scheme of some magnitude was in progress, and also at Cape Town, where the new Duncan dock was completed. The new basin added 290 acres to the sheltered accommodation for shipping at the port. The naming ceremony of the dock took place on April 19, 1943. Just prior to this event, on March 13, the first pile was driven for the enclosure cofferdam within which was to be constructed a large new graving dock, with an effective length of 1,212 ft., an internal width of 150 ft. and a depth over all of 40 ft. at low water. Work on the site was actually commenced in May of 1942, when dredging operations were begun.

Another new graving dock was projected for the port of East London, with a length of 750 ft., a width of 80 ft. and a depth over sill of 29 ft. Port improvement works to cost £900,000 were in hand at the port of Durban, Natal.

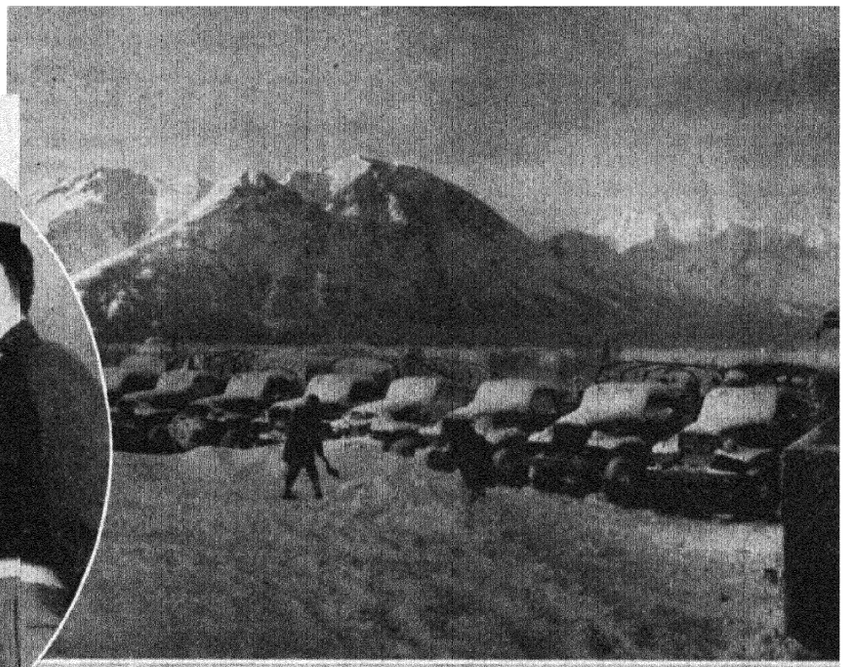
Kindred developments took place in East Africa, where at the port of Mombasa two new deep-water berths were provided and at Beira the depth of water at Pungwe wharf was increased. (B. CU.)

Roads and Highways. Notable highway construction throughout the world in 1943 was limited to routes urgently needed for movement of men and materials in the prosecution of the war. Men, materials and equipment were not available for general highway construction. Highway networks in all of the countries at war played an important part in transport for war production and feeding of armed forces and civilian populations. The highways were maintained as a necessary war measure but not to the high standards of peacetime maintenance. Normal replacements of old roads nearing the end of useful life were not made. The war brought a gradual decline in the condition of roads throughout most of the world.

Alaska Highway.—This highway, extending 1,483 mi. from Dawson Creek, B.C., to Fairbanks, Alaska, was the greatest single highway construction job undertaken up to Jan. 1, 1944. Work was begun in the spring of 1942 by 7 regiments of U.S. army engineers and the civilian forces of 52 contractors working under the Public Roads administration. By the beginning of winter the combined forces had pushed through a pioneer road for the entire length of the route.



During the winter of 1942–43 work was carried on in the cold and darkness of the subarctic region, building barracks, shops and major bridges across the Peace, Kiskatinaw and Sikanni Chief rivers on the south end of the project. This work was rushed in anticipation of the large volume of hauling from Dawson Creek to begin with the first mild weather.

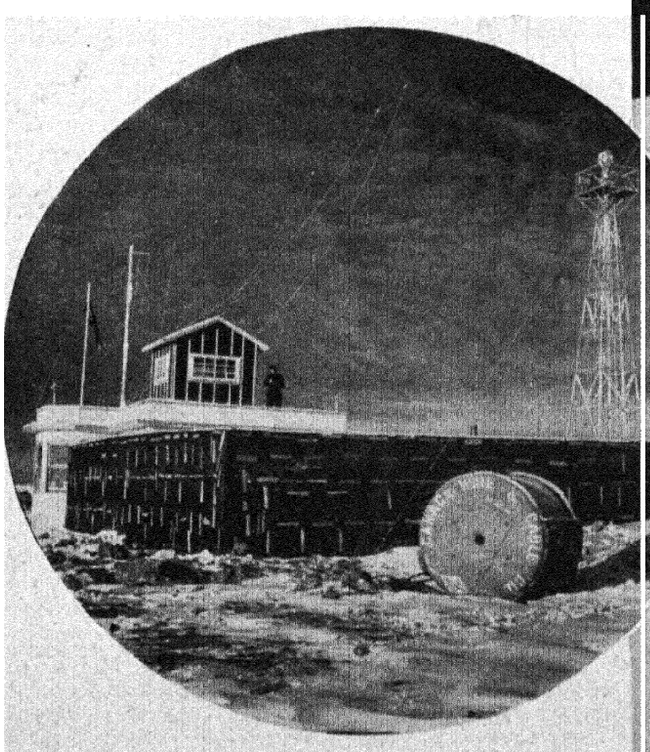


A highway adequate for all military purposes was completed during the construction season of 1943. In general the route followed along the pioneer road built in 1942 but a number of relocations materially shortened the distance. Work was done by 14,000 men employed by 81 contractors from the United States and Canada and by one regiment of U.S. engineers. Nearly 6,000 units of heavy road building equipment were kept going by two shifts of men working 10 or 11 hours each.

Floods in the early spring and summer took out most of the temporary bridges constructed in 1942. These were replaced by permanent structures. In all there were 86 permanent bridges to build. A few of the larger steel structures were not to be completed until 1944 because of delays in obtaining and delivering steel.

A large volume of traffic flowed over the highway in 1943 to supply and expand the airports and emergency fields on the air route to Alaska.

United States.—Highway work in 1943 consisted almost entirely of road construction and services having a direct connection with the conduct of the war. Governmental restrictions on the use of manpower and materials practically terminated



Above, left: TRAFFIC CONTROL HEADQUARTERS of the Alaska highway at Dawson Creek, B.C., Canada. The position of every army truck on the road is indicated on the board

the normal highway construction program but considerable work was done in building roads to war plants and training centres. In Sept. 1943, traffic on main rural highways in most states had declined 40% to 50% from the 1941 level. Estimates of motor vehicle registration indicated a decline in automobile registrations from the 1941 figure of 10.7% while trucks declined only 2.7%. With a more intensive use of trucks and somewhat larger loads there was no material reduction in the amount of freight hauled by highway.

In the federal road building program 8,445 mi. of road of all classes were completed during the fiscal year ending June 30, 1943, as compared with 12,936 mi. in the fiscal year 1941. The highways completed in the fiscal year 1943 included 2,836 mi. of access roads to war industries and military establishments, 4,148 mi. on the federal-aid system, 1,056 mi. of secondary federal-aid roads, 106 mi. in connection with the elimination of railroad grade crossings, 168 mi. of national forest highways, and 131 mi. of miscellaneous construction. These classifications were indicative of the source of the funds used in making the improvements. Practically all of the projects completed were urgently needed in the war effort. The total cost of all completed work was $274,801,799 of which the federal government paid $196,600,272.

Federal aid in the amount of $60,000,000 was made available for planning postwar highway projects and nearly 500 planning projects were initiated. The total mileage involved amounted to about 5,000 mi. and $5,800,000 in federal planning funds were involved. Major city arteries, alternate routes around cities, and limited access highways had an important place in this program. A master plan for highway improvement was outlined by the president's National Interregional Highway committee.

Inter-American Highway.—Great progress was made during 1943 in closing the gaps in this 3,300-mi. highway from Laredo, Texas, to the Panama Canal Zone. Mexico continued work on closing the two gaps totalling 500 mi. between Oaxaca and the Guatemala border. Because of the strategic importance of this highway, particularly in defending the Panama canal against air attack, agencies of the United States government gave considerable aid in closing the gaps south of Mexico. The Defense Highway act of 1941 authorized $20,000,000 for work between the Mexico-Guatemala border and Panama. Co-operation was conditioned upon the payment of at least one-third of construction costs by governments desiring assistance. It was originally planned to spread the work over a 5-year period but the war significance of the project made it necessary to accelerate the work. Agreements were entered into with the various governments and during the year construction was begun on about 275 mi. of road and a number of bridges. This work was under the direction of the Public Roads administration of the Federal Works agency. The most spectacular construction was in Costa Rica where the continental divide is crossed at an elevation of 10,930 ft. At the end of 1943 the only large gaps in the Inter-American highway were in southern Mexico and in Costa Rica.

Pan-American Highway.—That portion of the Pan-American highway north of Panama was also called the Inter-American highway and progress on this section is described above. Work was done on one of the three remaining gaps in Ecuador. There were no other major construction projects along the route. The general progress being made on the system as a whole was indicated by the fact that it was possible in 1943 to drive from Lima, Peru, to Buenos Aires in the dry season, and in any season to drive from Caracas, Venezuela, to a point south of Quito in Ecuador. The 8,097 mi. of highway in the South American section between the Colombia-Panama border and Buenos Aires, Argentina, (alternate routes included) had improvements as follows in 1943: Paved, 2,015 mi. or 25%; all weather surfaces, 4,147 mi. or 51%; dry weather surfaces, 1,646 mi. or 20%; and unsuitable for motor vehicles, 289 mi. or 4%.

Other Work in the Americas.—Peru was completing the last link in a 572-mi. highway from the Pacific port of Callao across the Andes mountains to the headwaters of one branch of the Amazon. This route crosses the Andes at an elevation of 15,900 ft. It passes through a region suitable for growing rubber, tea and other products that have been imported from the orient. Colonization was taking place rapidly in the vicinity of Tingo Maria.

In Bolivia, engineers from the United States assisted the Bolivian Development corporation in surveying and preparing plans for a road from Cochabamba in the high plateau country to Santa Cruz on an Amazon tributary. This road, when built, was expected to make available to the more populated section of the country many agricultural products that have been imported.

Brazil continued the gradual development of main highways from Rio de Janeiro to Porto Alegre to the south, to Belo Horizonte to the west, and to Baia to the north. The population of Brazil is spread mainly along the Atlantic coast and depends upon ocean transport to a considerable extent. Submarine attacks on this commerce made the nation conscious of the need for more rapid improvement of its coastal highways. For some time Brazil imported a considerable quantity of bulldozers, graders and other modern road-building equipment. These machines were scattered throughout the settled portion of the country and were extending the road network.

Argentina ranked high among South American countries in road improvement. That country in 1943 was covered by a network of highways that were improved in some degree. General improvement of these highways continued.

Europe.—In Great Britain the existing highways were subjected to a heavy war traffic. An excellent organization was created for immediate repair of war damage to highways. In one instance a 270-ft. bridge was wrecked and replaced in 120 hours. Many miles of service roads for military installations were built but construction of general use highways was deferred until after the war. Highways had a prominent place in postwar planning activity. A plan to remodel London was presented for consideration by the London county council in July 1943. The authors of the plan, J. H. Forshaw and Prof. Patrick A. Abercrombie, stated that the road plan is based on the Bressey-Luytens plans of 1937 but that they introduced modifications "to bring the road system into conformity with a plan which embraces all aspects of redevelopment-housing, industry and open spaces as well as transport." The plan included main arterial radial roads with three ring roads. Tunnels would be used at the centre of the city.

The French road system was reported to be deteriorating because of lack of maintenance. The French press reported some 50,000 mi. of highway in bad condition and likely to disintegrate because it was not possible to obtain tar for maintenance work

A road from Narvik in northern Norway to the port of Petsamo, Finland, under construction for nearly two years, was reported as completed early in 1943. The work was done by prisoners of war and conscripted Norwegians.

Press reports from German-occupied countries described plans for the construction of great road systems in France, Hungary, Czechoslovakia and Yugoslavia to be undertaken in the near future. There was no evidence that this was anything more than propaganda to build up the hopes of people under German domination.

Other Countries.—In Turkey highways from Mersin to Ankara and from Erzurum to Ankara were scheduled for completion in 1943. The 312-mi. highway from Ankara to Istanbul

was also scheduled for completion.

One of the spectacular road jobs of 1943 was the improvement of the highway in Iran from the Persian gulf to the Caspian sea. This highway, a railroad and terminal facilities, known as the Persian supply corridor were operated by U.S. army engineers to supply the soviet armies with great quantities of war supplies. The corridor was about 700 mi. long. A primitive road across 180 mi. of desert where the temperature rises to 150° and through mountains at an elevation of 8,000 ft. was converted into a road suitable for heavy truck hauling. In Aug. 1943, trucks were hauling five times the amount hauled eight months previously and 11 times the tonnage moved over the Burma road in its peak month of operation. Supplies moved to the soviet army as fast as it could take them away from the port on the Caspian sea.

Early in 1943 a force of 5,000 men was at work on a new motor road that will shorten the distance from Peshawar, India, to Kabul, Afghanistan, from 195 mi. to 165 mi.

The 621-mi. road across central Australia from the railhead at Alice Springs to a connection with the railroad extending south from Darwin was put to intensive use. This road was opened to traffic in Sept. 1940, and it was reported that truck travel amounted to 3,000,000 mi. a month. Hauling costs dropped from 9.15 cents per ton-mile in the first month of operation to 4.48 cents per ton-mile. Because of the great importance of this war-supply highway it was being extended to Darwin, a distance of 1,000 mi. from Alice Springs.

Many miles of military road were built behind the fighting fronts in North Africa, the Solomon Islands, the Aleutian Islands, Sicily, the soviet republics and in northeast India. Roads over which military vehicles may move are essential in modern warfare. Most of these roads, of necessity, were hurriedly constructed, and they were kept in use in wet weather only by extreme efforts. While they might later have some peacetime uses they did not constitute an important addition to the world's highways. (*See* also MOTOR TRANSPORTATION.) (T. H. MACD.)

Robert, Georges Achille Marie-Joseph

(1875–), French naval officer, was born Jan. 31. He entered the navy, 1893, rose to the position of vice admiral, 1930, and had been commander of the Mediterranean squadron. When war broke out in Sept. 1939, he was sent to the Antilles as high commissioner of Martinique and Guadeloupe. In June 1940, after the fall of France, Pétain vested Robert with dictatorial powers for the rule of all French possessions in the western hemisphere. Robert immediately ousted de Gaullists from posts of power, instituted strict controls over the press and radio, established a secret police and created concentration camps for political prisoners. Facing the possibility of famine in the islands under his rule, Robert reached an agreement with the U.S. in Nov. 1940. The U.S. shipped food to the starving islands, and Robert immobilized some of the French warships in the harbours. The U.S. attitude toward his regime stiffened following reports that German U-boats were given refuge and refuelling rights in Martinique ports, and on April 26, 1943, Washington formally severed all relations with Robert's regime. Lack of food and growing unrest among the people of the islands compelled the French admiral to end his regime in July 1943. A Vichy dispatch, Dec. 30, said that Robert had arrived in Vichy for conferences with Marshal Pétain.

Roberts, Sir Charles George Douglas

(1860–1943), Canadian poet and author, was born Jan. 10 in Douglas, York county, near Fredericton, N.B., and graduated from the University of New Brunswick, 1879. He was headmaster of the Chatham grammar school, 1879, and a faculty member of King's college, Windsor, Nova Scotia, 1885–95. In the early 1900s he was recognized as an outstanding Canadian author and had several volumes of poetry and fiction to his credit. During World War I he served in France and was mustered out after the armistice with the rank of a major. He was knighted in 1935. His better-known works of poetry are *Orion and Other Poems* (1880) and *Songs of the Common Day* (1892). Among his novels are: *The Forge in the Forest* (1897), *The Heart of the Ancient World* (1900), *The Kindred of the Wild* (1902), *Red Fox* (1905), *The Heart That Knows* (1906), *Kings In Exile* (1909), *Hoof and Claw* (1913), *The Wisdom of the Wilderness* (1923) and *Lovers in Acadie* (1924). Sir Charles died Nov. 26 in Toronto.

Rockefeller Foundation.

The foundation was chartered in 1913 for the permanent purpose of "promoting the well-being of mankind throughout the world." Its program is concerned with certain definite problems in the medical, natural and social sciences, the humanities and public health. During 1943 the foundation appropriated approximately $7,685,000 for work in its various fields of interest. The chairman of the board of trustees in 1943 was Walter W. Stewart; the president, Raymond B. Fosdick; and the secretary, Norma S. Thompson.

The General Education Board was incorporated by act of congress in 1903, with the stated object of "promoting education within the United States of America without distinction of race, sex, or creed." Its program is restricted largely to the support of education in the southern states. During 1943 appropriations approximating $2,573,000 were made by the board. The chairman of the board of trustees in 1943 was Walter W. Stewart; the president, Raymond B. Fosdick; and the secretary, William W. Brierley. (H. B. V. W.)

Roentgen Ray: *see* RADIOLOGY.

Rokossovsky, Konstantin

(1905?–), Russian army officer, first saw action against the Germans during World War I. After the Russian revolution, he joined the communists, fought in the civil wars, 1918–20, and in the Russo-Polish campaign of 1920. After peace was restored, Rokossovsky, who had displayed talent for tactics and leadership, was sent to the Frunze Military academy, where he studied tank and air warfare. During the battle for Moscow, 1941, Rokossovsky commanded one of the seven Russian armies defending the capital and acquitted himself with merit He waited until the Germans had exhausted their reserves in their final attempt to reach Moscow and then launched a savage counter-offensive, hurling back the invaders on a wide front. One of the "younger generals" and a capable leader, Rokossovsky won his greatest renown at the battle of Stalingrad, 1942–43. He was in command of the six soviet armies on the Don front that first trapped and then annihilated the 22 divisions of the German 6th army commanded by Field Marshal Friedrich von Paulus in Feb. 1943. When Stalin took over the post as commander in chief of all Russian armies in 1942, he broke up the large and unwieldy fronts into smaller sectors and assigned a command to Gen. Rokossovsky on the Don front. In Sept. 1943, when the Russian armies were driving the Germans westward, Rokossovsky was head of an army on the central part of the front.

Roman Catholic Church.

The pope, Pius XII (*q.v.*), is recognized as the supreme

ruler of the Roman Catholic Church. Appointed by the pope are the cardinals, archbishops, bishops, vicars and prefects apostolic who govern the ecclesiastical jurisdictions throughout the world. The college of cardinals consists of 70 members with its full complement. Through 1943 no new cardinals had been created by Pius XII since he became pope in 1939. The Sacred college consists of 6 cardinal bishops, 50 cardinal priests, 14 cardinal deacons. At the beginning of 1943 the College of Cardinals consisted of 49 members. The complement was reduced to 43 by six deaths, and at the close of the year the cardinals numbered 25 Italians and 18 non-Italians.

The Catholic population of the world in 1943 was estimated at between 399,000,000 and 400,000,000. The number of patriarchates was 14; 7 of the Latin rite, that of the West Indies being vacant, and 7 of the Oriental rites. The number of residential sees in the Catholic Church in 1943 was 1,226, including archbishoprics and bishoprics. Vicariates and other jurisdictions numbered 517. Ecclesiastical jurisdictions in the Americas were: United States 118; Brazil 101; Canada 50.

The number of Catholics on the American continents was estimated to be about 112,000,000 in 1943. Catholics in the United States and territories numbered some 22,945,247. There were 2 cardinals, 21 archbishops, 131 bishops and apostolic vicars. The clergy numbered 24,031 secular priests and 12,939 regular. Public churches and chapels numbered 18,976; high schools 1,522, parochial schools 7,647. Seminaries were reduced by ten to 193, and universities and colleges for men to 139—a reduction of nine. During 1943, 40 bishops died and 4 new dioceses were created.

Chaplains in the United States forces numbered about 3,000 at the end of 1943. During the year 17 Catholic chaplains died in action or in line of duty.

Catholics in England and Wales were estimated at 2,406,419; in Scotland 614,469. Clergy of Great Britain were 3,903 secular and 1,981 regular. Chaplains in the services were 679. Catholic members of the house of lords were 48; of the house of commons 22. Catholics in Eire and Northern Ireland were estimated at 3,285,659. Canada, with 50 episcopal jurisdictions, had 7,137,069 Catholics in 1943. Catholics in Australasia, including Australia and New Zealand numbered 1,696,954. Total Catholics in the British commonwealth were estimated at 20,438,856. Total number of Catholics in the English-speaking countries were 56,301,820 in 1943.

Bishop Bernard W. Griffin, auxiliary of Birmingham, was named Dec. 22 as archbishop of Westminster and Catholic primate of England, in succession to the late Cardinal Hinsley.

The Church and World War II.—Stubborn resistance to the totalitarian order by the church prevailed throughout 1943. In Belgium Canon Cardijn, labour union leader, was imprisoned by the nazis. Seizure of church bells by the nazis was denounced by the bishops, who again assailed the invaders in a joint pastoral March 21. Abbé Cordonnier was executed for aiding British airmen. Mgr. Van Wayenbergh, rector of Louvain university, was sentenced to imprisonment. The blind Franciscan priest, Father Agnelli, was sent to internment in Germany. The bishop of Namur excommunicated the Rexist leader Léon Degrelle, and the bishop of Tournai denounced nazi seizure of his cathedral.

The Rt. Rev. Thomas Megan, U.S. missionary, was appointed head of the Chinese social service by Generalissimo Chiang Kai-shek. An outspoken pronouncement of the French bishops on March 7 condemned the deportation of French workers to Germany.

It was stated in 1943 that 2,943 friars of the Franciscan order had been conscripted into the German army as combatants; and during the year 1,200 German priests and members of religious orders were known to have been interned in concentration camps. In a strongly worded protest Bishop Dietz of Fulda accused the nazis of pantheism; and on Aug. 19 the Catholic bishops in conference at Fulda accused the nazis of religious persecution. A further denunciation of the nazi attack on human rights was made by Bishop Von Preysing of Berlin; and the German bishops sent a joint message to the pope regretting the bombing of Vatican City on Nov. 5.

Stubborn resistance to the invaders was continued by Catholics of the Netherlands. The Dutch bishops issued a joint pastoral forbidding co-operation with the nazis Feb. 17. On Feb. 21 the bishops published a denunciation of the activities of the German occupation authorities. The plans of the nazis for sterilization of certain members of the population was sternly rejected by the Christian doctors of the Netherlands. On May 12 the bishops again accused the nazis of propagating anti-Christian concepts. The famous Jesuit college at Valkenburg was taken over by the nazis and the church was closed to worshippers.

Cardinal Seredi, prince-primate of Hungary and archbishop of Esztergom, in a forthright statement condemned the master race propagandists as tools of Satan.

Italian prelates and clergy were placed in a precarious position by the nazi occupation and the invasion by the United Nations. After the bombing of Rome Italian cardinals gave guidance and reassurance to their various flocks. In the centre and north of Italy priests who condemned terror and pillage were seized by the gestapo. The monks of the famous Benedictine abbey of Monte Cassino, founded by St. Benedict himself, were ordered by the nazis to leave their abbey and seek refuge in Rome. Famous treasures, both of the abbey and others sent for safe keeping from many parts of Italy, were seized by the nazis and sent to Germany. Cardinal Schuster, archbishop of Milan, whose city was occupied by the Germans, denounced the nazis as godless hordes of bandits on Nov. 27.

Catholic bishops of Lithuania, who were promised respect for their religion by the occupiers, accused the nazis of violating their promises. In Mexico the archbishop of Mexico City begged the pope to intervene in behalf of Bulgarian Jews.

In Poland the persecution of the church continued. Some 3,000 Catholic priests were reported to have been executed by the Germans. A nazi decree ordered that baptism could be administered only by German priests, and nazi governors in Poland issued orders that hymns and prayers referring to Poland were prohibited. The well known Catholic Lublin university, whose faculty and students were dispersed, was adopted by Fordham university in New York city.

Slovakia also made its voice heard against its nazi ally when the Slovak bishops on March 21 denounced the nazi law forbidding the baptism of Jews.

Vatican City on April 19 began a weekly broadcast in Russian to war prisoners and persons in occupied territory. Radio Vatican stated categorically that the Holy See did not recognize any wartime creation of new states. The same radio broadcast a statement condemning Japanese atrocities.

Papal Official Acts.—Preparations were made by the Sacred Congregation of Rites, and approved by the pope, for the beatification or canonization of Vincenta Maria Lopez; Innocenzo da Berzo; Peter Donders; John Nepomuc Tschiderer; Imedla Lambertini; Placido Baccher; Michel Garicoits; Placido Riccardi; Caterina Volpicelli; Jeanne de Valois; Nicolas von der Flue; Maria Eustochio Verzeri; Popes Innocent XI, Benedict XIII, Pius IX, Pius X. The Sacred Congregation of the Sacraments broadcast to all countries new instructions for caring for the Blessed Sacrament during war emergencies. Designated laymen were authorized to seek out the Sacred Hosts that were scattered by bombing. The Holy Office permitted the use of water divining

as a scientific experiment.

United States.—According to Brig. Gen. W. R. Arnold, U.S. Catholic chaplains in 1943 exceeded 25% of the quota and were estimated to number about 3,000 at the end of the year. Archbishop Francis J. Spellman of New York, during his visits to the fronts, addressed the U.S. forces in North Africa March 14. V. Rev. Patrick A. O'Boyle was appointed by the bishops as executive director of war relief agencies.

The following events occurred in the U.S. hierarchy during 1943: Bishop Edward F. Hoban was installed as coadjutor of Cleveland, O., Jan. 21; Most Rev. William T. McCarty, C.SS.R., was consecrated assistant military bishop Jan. 25; Most Rev. Martin J. O'Connor was consecrated auxiliary of Scranton, Pa. Jan. 27; Most Rev. Edwin V. Byrne was appointed archbishop of Santa Fe, N.M. June 15; Most Rev. Joseph A. Burke was consecrated auxiliary of Buffalo, N.Y. June 29; Most Rev. Matthew A. Niedhammer was consecrated bishop for Nicaragua June 29; Most Rev. James A. McFadden was installed as first bishop of Youngstown, O.; Most Rev. Johannes Gunnarsson, S.M.M. was consecrated bishop for Iceland July 7; Archbishop Walsh of Newark, N.J. celebrated his episcopal silver jubilee July 29; Most Rev. Bryan J. McEntegart was consecrated bishop of Ogdensburg, N.Y. Aug. 23; Most Rev. Francis J. Haas was consecrated bishop of Grand Rapids, Mich. Nov. 18; Most Rev. James P. Davis was consecrated bishop for San Juan, P.R.

Twenty-three Catholic archbishops and bishops joined with Protestant and Jewish leaders in signing a seven-point declaration on world peace. The Catholic hierarchy supported food relief for nazi-occupied lands in senate resolution 100 Nov. 27.

The Mendel medal for scientific achievement was awarded to Dr. Speri Sperti. The James J. Hoey medal for interracial justice was presented to Philip Murray, president of the C.I.O., and Ralph H. Metcalfe of the National Catholic Community service. Francis P. Matthews, supreme knight of the Knights of Columbus, received the Catholic Action medal, and the Laetare medal was presented to Thomas F. Woodlock, editor and financier of New York.

Catholic periodicals showed a circulation of 10,008,874, an increase of 883,219 over 1942.

Missions.—One Catholic missionary priest was executed by the Japanese in Shansi province in China, and several churches were burned. Six Dutch and Belgian missionary bishops and other missionaries were interned by the Japanese in China. Japanese troops occupied the house of the Paris foreign missions at Hongkong, and the missionaries were transferred to Chungking. Supervision of all prayer books was ordered by the Tokyo government, as well as all official documents of the church. Vatican radio stated that all Oblate mission priests in the Philippines had been interned and their houses confiscated or destroyed. Eighty-one U.S. Jesuit missionaries, among them Bishop Hayes, were interned by the Japanese at the Ateneo de Manila, P.I. Japanese authorities in the Philippines removed all foreign missionaries from their local religious work. Foreign missionaries in China also were re-interned. (*See* also CATHOLIC COMMUNITY SERVICE, NATIONAL; CATHOLIC LIBRARY ASSOCIATION; CATHOLIC ORGANIZATIONS FOR YOUTH; CATHOLIC RURAL LIFE CONFERENCE, NATIONAL; CATHOLIC WELFARE CONFERENCE, NATIONAL; PIUS XII; VATICAN CITY STATE.) (J. LAF.)

Rome. Until July 19, 1943, the capital of Italy had been immune to all air raids in World War II. Rome was an important rail centre as well as the seat of Mussolini's government, but St. Peter's cathedral and Vatican City were located there, and any strategic advantage which might be gained by bombing the city would be more than counter-balanced by grief and possible anger throughout the Catholic world if sacred Christian shrines should be destroyed.

THE FIRST BOMBING OF ROME, July 19, 1943. Billows of smoke are rising from the San Lorenzo freight marshalling yards, four miles east of Vatican city, during the attack by 500 U.S. bombers

But three new factors intervened: the invasion of Sicily and the necessity of interrupting the constant reinforcement of axis troops, the desirability of driving out Mussolini as quickly as possible; and precision bombing as practised by Americans in broad daylight, thus guaranteeing the security of the more important religious monuments. And so the U.S. bombers flew to the attack, their object the rail yards, four miles distant from Vatican City.

The raid was pre-eminently successful as a military venture. Liberators wrought ruin at the Littorio yards north of Rome, and Flying Fortresses did likewise at the Lorenzo yards on the eastern edge of the city, pulverizing rail connections, demolishing rolling stock and buildings. But one basilica close to the Lorenzo yards unfortunately was hit, and when the pope as bishop of Rome visited his church the axis press raised the cry of sacrilege. This was not ineffective, for aside from a second raid which speedily followed, the Allied air fleet left Rome severely alone during the subsequent months of 1943. Stray bombs afterwards fell upon Vatican City, doing minor damage, but whether they were Allied or axis bombs it was impossible to say.

The Germans did not occupy Rome directly upon Mussolini's downfall, since Victor Emmanuel still professed loyalty to the axis. But the Germans were highly suspicious, and both the king and Marshal Badoglio escaped just in time to avoid capture by the incoming nazis. The latter immediately proclaimed that they would protect the pope; they also threatened to treat Rome as they had Naples. Meanwhile all Jews were rounded up and hauled away to unknown destinations. Hitler's gestapo was impowered to hunt down anti-fascists. (W. P. HL.)

Rommel, Erwin (1891–), German army officer, fought on the western front and the Italian front in World War I. He joined the postwar reichswehr and fought

as a storm-troop leader in the nazi party. He advanced rapidly in the German army and his brilliant strategy and tactics in mechanized warfare won him early recognition. In the battle of France, Rommel's tank units smashed through the Maginot line at Sedan in May 1940 and swept to the coast at Abbeville, closing a ring around 1,000,000 Allied soldiers in northern France and Belgium.

Rommel, who was made commander of the German desert armies in 1940, added to his reputation as a strategist in his battles against the British in Africa during 1941–42. But in Oct. 1942 the British launched an offensive that compelled Rommel to retreat more than 1,000 miles and yield all of Libya for a last-ditch stand in Tunisia. In March 1943, it became apparent that the Afrika Korps was hopelessly trapped in Tunisia; at this juncture Rommel was called back to Germany for "reasons of health." Gen. Juergen von Arnim superseded him as commander of the axis forces in Tunisia. In Sept. 1943, after the Allied invasion of Italy, it was revealed that Marshal Rommel had been given command of German forces in North Italy. A month later, German press dispatches said that Rommel had been given full charge of the army in Italy and of axis operations in Yugoslavia. Subsequent German reports hinted that Rommel was to be given the task of meeting Allied invasion armies on the "invasion coast."

Roosevelt, Franklin Delano (1882–), 32nd president of the United States (see *Encyclopædia Britannica* for extended biography).

President Roosevelt devoted himself almost wholly to war and postwar problems in the critical year of 1943. He delegated supervision of domestic questions to a group of officials who came to be known as his "War Cabinet."

The president gave a preview of his year's program in his opening message to congress on Jan. 7, 1943. He reported that the Allies were on "the road to victory," and he outlined a postwar world in which, he said, Americans would have assurance of freedom from want "from the cradle to the grave." He also promised freedom from fear through the defeat and disarmament of Germany, Japan and Italy, or any other nation which coveted a neighbour's territory.

In January Mr. Roosevelt made the first of several foreign visits designed to knit more closely the military and political plans of the United Nations. On the 26th of that month the world was startled by the announcement that the president and Prime Minister Churchill had conferred for ten days at Casablanca, North Africa, with their full military and naval staffs.

The meeting followed logically, they explained, on the expulsion of the German and Italian forces from Africa. They said that they had mapped the 1943 campaign against Germany, and in a press interview Mr. Roosevelt added that the offensive would end only in the "unconditional surrender" of the axis.

In April the chief executive made another eventful trip. On the 20th of that month he met President Avila Camacho of Mexico at Monterrey, Mexico. It was the first meeting between the heads of these two countries since William Howard Taft conferred with Porfirio Diaz at Juarez in 1909.

Mr. Roosevelt, at a formal dinner in his honour, assured Mexico of American good will, and repudiated for both nations any selfish or imperialistic designs. Camacho, in response, called for a peace that would eliminate "the old faults of ambition, of imperialism, of inequity and sordid privilege."

In August Mr. Roosevelt met Mr. Churchill again at Quebec, and the military and naval experts were present in full force. Allied successes in Sicily and Italy, it was explained, necessitated the making of more detailed and integrated arrangements for the invasion of Europe, and major discussions centred on that topic. While in Ottawa, President Roosevelt addressed the Canadian parliament.

In late November Mr. Roosevelt attended another of these historic assemblages, this time at Cairo. There he conferred with Churchill and Generalissimo Chiang Kai-shek on the far eastern phase of the conflict. The three announced on Dec. 1 their determination to strip Japan of all the islands she had "seized or occupied" since World War I, the territory she had stolen from China, the Korean peninsula and all the areas she had conquered in World War II.

Stalin did not attend the Cairo meeting because his nation was not at war with Japan, so President Roosevelt and Prime Minister Churchill flew directly to Tehran, the capital of Iran, for a conference with the soviet dictator. It was the first meeting between the American chief executive and the occupant of the Kremlin. The official announcement's most significant passage was:

"We express our determination that our nations shall work together in war and in the peace that shall follow. . . . We have reached complete agreement as to the scope and timing of the operations (against Germany) to be undertaken from the east, west and south. . . . We came here with hope and determination. We leave here friends in fact, in spirit and in purpose. Signed: Roosevelt, Churchill and Stalin."

In a radio report to the nation on Christmas Eve, President Roosevelt elaborated on the arrangements made at this series of conferences for permanent preservation of world peace. He declared that the United States, Great Britain, Russia and China would act in concert, not to enslave the German people, but to get rid "once and for all of nazism and Prussian militarism." He said "if force is necessary to keep international peace, international force will be applied—for as long as may be necessary."

Preoccupied with foreign affairs, President Roosevelt created on May 28 an agency designed to free him of concern with domestic problems. He established a central organization known as the Office of War Mobilization with a mandate to "keep both our military and civilian economy running at top speed and to eliminate friction from rival agencies."

As head of the new agency he named James F. Byrnes, who resigned from the supreme court late in 1942 to become economic stabilizer. Other members were Secretary of War Henry L. Stimson, Secretary of Navy Frank B. Knox, War Production Board Chairman Donald M. Nelson, Munitions Assignment Board Chairman Harry L. Hopkins and Fred M. Vinson, who succeeded Mr. Byrnes as economic stabilizer. So much authority was transferred to this board that Mr. Byrnes was given the unofficial title of "Assistant President."

Marvin F. Jones of Texas, who resigned from the U.S. court of claims in January to become Mr. Byrnes' aide, was named food administrator in June, succeeding Chester C. Davis. The latter, who was on leave from his post as president of the Federal Reserve bank at St. Louis, quit because, as he wrote the White House, there was too great a division of authority in this field. As evidence of difficulties in a related realm, Mr. Roosevelt had three price administrators in 12 months—Leon Henderson, ex-Senator Prentiss M. Brown of Michigan and Chester A. Bowles of Massachusetts.

In midsummer Vice-President Henry A. Wallace precipitated another reorganization of various agencies associated directly or indirectly with prosecution of the conflict. As head of the Board of Economic Warfare, he charged in an open and tart letter that Jesse H. Jones, secretary of commerce and chairman of the Reconstruction Finance corporation, had handicapped his foreign operations. Mr. Jones denied the allegation in an equally sharp letter.

In a communication interpreted as a rebuke to both officials, the president abolished the Board of Economic Warfare, and established the Office of Economic Warfare, which later became the Foreign Economic administration. Leo T. Crowley, alien property custodian and head of the Federal Deposit Insurance corporation, was placed in command of the new unit.

The Foreign Economic administration was eventually expanded to embrace the Lend-Lease administration, several RFC subsidiaries engaged in developing or purchasing raw materials abroad, the Board of Economic Warfare's old functions and the Office of Foreign Relief and Rehabilitation. As further evidence of the increasing importance of economic problems, Mr. Roosevelt named Edward R. Stettinius Jr., under secretary of state, in place of Sumner Welles, resigned. Former board chairman of U.S. Steel, Mr. Stettinius had served as Lend-Lease administrator.

As allied might pointed toward 1944 as a year of decision at least in the European theater, President Roosevelt showed growing concern over a postwar program. He placed Bernard M. Baruch in charge of the problem of reconverting plants from wartime to civilian production. He asked Herbert H. Lehman, former governor of New York, to head the Office of Foreign Relief and Rehabilitation. In that capacity Mr. Lehman arranged for an international conference that was held at Atlantic City in November.

The conferees organized a United Nations Relief and Rehabilitation administration, with Mr. Lehman as director.

Mr. Roosevelt found it necessary to cope with domestic troubles as the year drew to a close. When railroad unions dissatisfied with his aides' handling of their wage increase petition called a nationwide strike for Dec. 30, he ordered Secretary Stimson to take over and operate the lines. Two days later, on December 27, the strike order was withdrawn by the unions.

Mr. Roosevelt's apparent indifference toward his domestic program of social and economic reform disquieted his liberal aides and followers during 1943. On Dec. 28 he seemed to confirm their fears. He announced at his press conference that he intended to scrap the "New Deal" as a slogan, and to substitute a "Win the War" declaration as a White House motto.

"Dr. New Deal," he explained, was needed to cure the patient that was the United States in 1933. But, he continued, the convalescent required a new kind of physician after Dec. 7, 1941—Pearl Harbor—and, therefore, he had called in "Dr. Win the War." He indicated, however, that a "Super New Deal" might appear after the war to rebuild the social and economic structure of this country and the world. He warned that the United States could never again isolate itself—politically, militarily or economically. (*See* also UNITED STATES.) (R. TU.)

Roosevelt, Kermit (1889–1943), U.S. explorer, author and soldier, was born Oct. 10 at Oyster Bay, N.Y., the son of the late Theodore Roosevelt, 26th president of the U.S. He was educated at Groton and Harvard and as a youth accompanied his father on a big game expedition to Africa and on an exploration trip of the "River of Doubt," subsequently named the Roosevelt river by the Brazilian government. He later returned to South America where he spent several years in engineering work and banking. In 1917, he joined the British army, was commissioned captain and served in Mesopotamia and Palestine. When the U.S. entered the war, he transferred to the A.E.F. and was in command of an artillery battery. After the war, he went into the shipping business and eventually formed the Roosevelt Steamship company which was merged with the International Mercantile Marine company in 1931 with Mr. Roosevelt becoming vice president. He resigned in 1938 and the next year sailed to England to enlist again in the British army. He was commissioned a major with the Middlesex regiment. Except for a brief period in 1940 when he helped recruit volunteers for the Finnish army, he remained with the British army serving in Norway and Egypt until invalided to England in Dec. 1940. He returned to the U.S. for treatment and following his recovery received an assignment to intelligence with the U.S. army, with rank of major. He was sent to Alaska in July 1942. Mr. Roosevelt was the author of *War in the Garden of Eden* (1919), *The Happy Hunting Grounds* (1920), edited *Quentin Roosevelt: A Sketch With Letters* (1921) and with his brother, Theodore, wrote *East of the Sun and West of the Moon* (1926) and *Trailing the Giant Panda* (1929). He died in Alaska of unrevealed causes, June 4.

Roper, Daniel Calhoun (1867–1943), U.S. politician, was born April 1 in Marlboro county, S.C. He was graduated from Duke university, 1888, had a brief try at teaching school and then entered politics. He gained a seat in the South Carolina house of representatives, 1892–94. Mr. Roper joined the Wilson bandwagon in 1916, became chairman of the organizing bureau during the Wilson campaign and was rewarded with the office of vice chairman of the tariff commission, March-Sept. 1917. Subsequently, Roper, known as a "dry," was named commissioner of internal revenue and made the first unsuccessful attempt to enforce the prohibition law. He resigned in 1920 to practise law in Washington but returned to the national scene four years later to stump for William Gibbs McAdoo, presidential aspirant. In 1933, President Roosevelt appointed him secretary of commerce. Roper's office came under a barrage of criticism when its two important branches, the bureau of air commerce and the bureau of navigation and steamboat inspection, were accused of negligence because of an unprecedented number of airliner crashes and the Morro Castle disaster. A conservative among New Dealers, Mr. Roper managed to retain the confidence of the administration brain-trusters as well as big business. He resigned his post in 1938 and the next year served briefly as minister to Canada. He wrote his autobiography, *Fifty Years of Public Life* (1941), with Frank H. Lovette. Mr. Roper died in Washington, D.C., April 11.

Rosenfeld, Kurt (1877–1943), German lawyer and politician, was born Feb. 1 in Marienwerder, Germany. He studied law and economics at Freiburg and Berlin universities and was admitted to the Berlin bar in 1906. During his legal career he defended such German revolutionists as Rosa Luxemburg, Kurt Eisner, Georg Lebedour and Karl von Ossietzky and at one time, during a libel trial in Munich where he was cross-examining Adolf Hitler, he compelled the court to fine the future fuehrer 1,000 marks for contempt when he declined to answer a question coming from Rosenfeld because the latter was a Jew. Rosenfeld was municipal councillor in Berlin, 1910–20, a member of the Reichstag, 1919–33, served on its foreign relations committee and was Prussian minister of justice, 1918–19. A staunch Social-Democrat, he served in World War I, but propagandized against the kaiser's government and after the armistice sought a democratic peace for Germany. He was chairman of the Socialist Labour party in Germany, 1931–33, and in the latter year was disbarred and deprived of his property and citizenship by the nazi government. He fled to the United States in 1934 and died in Sunnyside, Queens, New York, Sept. 26, 1943.

Rosenwald Fund, The Julius. The Rosenwald fund differs from other large U.S. foundations in that the trustees not only are permitted to spend capital as well as income at any time but are compelled to expend

all its funds within 25 years of the death of its founder, that is, before Jan. 6, 1957. During the 25 years following its establishment in 1917 by Julius Rosenwald, this fund expended approximately $18,000,000, which amounted to all of its income from year to year and about seven-eighths of its principal fund. At the close of the fiscal year June 30, 1943, the assets of the fund (held chiefly in capital stock of Sears, Roebuck and Co. of Chicago) had a value of approximately $3,000,000. The chief program of the fund during its early years was aid in the building of rural public schools for Negroes. The main programs in 1943 were: (1) improving the content and quality of rural education in both white and Negro schools in the south; (2) fellowships for Negroes and for white southerners and (3) efforts to improve race relations, especially the relations between white and Negro citizens throughout the United States. During the year 1942–43 the fund expended $475,000 upon these and related programs.

Rotary International. Rotary International is the world-wide organization of all Rotary clubs. In spite of war conditions throughout the world, Rotary had a gain of 10,221 members in 1943, and in this same period, 139 new Rotary clubs were organized in 13 countries of the Americas, and in Australia, China, England, India, New Zealand, Northern Ireland, South Africa and Sweden. On Dec. 14, 1943, there were 5,235 Rotary clubs in more than 50 countries of the world, with a membership in excess of 220,000.

Officers for the fiscal year 1943–44 were: president, Charles L. Wheeler, San Francisco, Cal., U.S.A.; vice-presidents, Carlos M. Collignon, Guadalajara, Mexico, and Harry C. Bulkeley, Abingdon, Ill., U.S.A.; secretary, Philip Lovejoy, Chicago, Ill., U.S.A.; treasurer, Rufus F. Chapin, Chicago, Ill. Headquarters in Chicago, Ill.; additional offices in London, England; Zurich, Switzerland; and Bombay, India.

During 1943, Rotary activities included general community betterment undertakings, work for crippled children and underprivileged children, the establishment and supervision of camps and clubs for boys and girls, assistance to students through scholarships and student loan funds, the promotion of high ethical standards in businesses and professions, and the development of international good will and understanding. In addition, Rotary clubs actively co-operated with their governments in rationing, salvaging and fund-raising campaigns, and in all phases of civilian defense, and engaged in activities for the alleviation of war suffering. In May 1943, the U.S. War Production board presented a citation to Rotary International in recognition of the meritorious salvage activities of the 3,400 Rotary clubs in the United States.

In the U.S.A. and Canada, 207 "Institutes of International Understanding" were sponsored by Rotary clubs, presenting to community forums and to high school audiences outstanding speakers on vital world problems. The 34th annual convention of Rotary International was held in St. Louis, Mo., U.S.A., May 17–20, 1943.

The official magazine of Rotary International is *The Rotarian*, which has a Spanish edition, *Revista Rotaria*. In addition, there are numerous regional Rotary magazines published throughout the world in several different languages. (P. Lv.)

Rowan, Andrew Summers (1857–1943), U.S. army officer, and bearer of the historic "message to Garcia," was born Apr. 23 at Gap Mills, W.Va. A graduate of West Point, 1881, he was commissioned as 2d lieutenant and later was appointed military attaché to Chile. He was ordered to Jamaica in April 1898, at the outbreak of the Spanish-American war, and there received instructions from the Military Intelligence bureau to deliver a message to Gen. Calixto Garcia, rebel Cuban leader. Rowan's task was to find Garcia in his mountain hideout, to get vital information on the strength of the insurgent armies and to arrange for their co-operation with American troops. Skirting the coast in an open sailboat, he crossed to Santiago, Cuba, hid in jungles and swamps and scaled difficult mountain terrain until he reached Bayamo where he found Garcia. Following his successful parleys with the rebel leader, Rowan returned to the U.S. and delivered to the war department the information which helped speed the American victory in Cuba. Rowan was promoted to lieutenant colonel, was publicly congratulated by Pres. McKinley and became a national hero. His feat was popularized in the celebrated work of Elbert Hubbard, *A Message to Garcia* (1899), which sold over 30,000,000 copies and was widely translated. Lt. Col. Rowan retired from the army in 1909 and in 1922 received the D.S.C. for his heroic exploit. He died in San Francisco, Jan. 11.

Rowing. Because of the war, the Poughkeepsie regatta was cancelled for the fifth time since its inception in 1895. Of the annual cup races, only the Adams Cup and Childs Cup were held, both with added starters to insure competition for all college boating crews. The Dad Vail regatta was cancelled, Rutgers university being the only member of the Dad Vail association to carry on the sport. Of the major rowing colleges, all boated crews with the exception of Syracuse and Yale.

The 1943 intercollegiate rowing season opened on the Pacific coast where, on March 26, the University of Washington varsity and junior varsity 150-lb. crews defeated the University of British Columbia heavy varsity and freshman crews by three and two lengths respectively over the one-and-one-half-mile Fraser river course in British Columbia.

On April 17 the eastern season opened at New Brunswick, N.J. with Princeton, Rutgers and Columbia over the one-and-five-sixteenths-mile Raritan river course. Conditions were excellent. Princeton won the varsity race in 7:2 by three-quarters of a length over Rutgers, with Columbia third. In the only other race the Columbia freshmen defeated the Rutgers junior varsity by two lengths in 7:35. Princeton and Columbia crews rowed in shells borrowed from Rutgers, but used their own oars.

Harvard and Massachusetts Institute of Technology opened the following Saturday, April 24, with a dual regatta over the one-and-five-sixteenths-mile Charles river course at Boston, Mass. Wind and choppy water made conditions slow. Harvard swept the regatta, winning the varsity race by one-half length in 6:58, the junior varsity by one and one-half lengths in 7:8, the 150-lb. varsity and junior varsity in 7:11 and 7:8 respectively, and the Harvard third varsity defeated the M.I.T. freshmen by one-half length. On the same day Columbia's varsity crew defeated Navy over the one-and-three-quarters-mile Harlem river course at New York city by the narrow margin of four-tenths of a second in the fast time of eight minutes flat. In the only other event the Navy plebes nosed out the Columbia freshmen by about the same margin in 8:22.2. In the third regatta of the day, Princeton won its second victory of the year, this time over Pennsylvania and Rutgers, over the one-and-five-sixteenths-mile Schuylkill river course at Philadelphia, Pa. The Princeton varsity's winning time was 7:16, one-fifth second ahead of Pennsylvania. Rutgers finished third, one length back. Pennsylvania won the junior varsity race by one length over Princeton, with Rutgers third, and the 150-lb. race over Princeton by the same margin.

On May 1, Harvard, Navy and Pennsylvania met in the Adams Cup regatta, with Cornell opening its season as an added starter. All races were over the one-and-five-sixteenths-mile Schuylkill river course, Philadelphia, Pa. After trailing Navy

up to the last 100 yards the Harvard varsity sprinted well to win by inches, thus retaining the Adams Cup for the sixth consecutive year. Cornell finished third, three and one-quarter lengths behind Navy and only a foot or two ahead of Pennsylvania. Time—6:42. This ended Harvard's brief but undefeated season and left them once again the mathematical champion in the east. Navy won the junior varsity race in 6:39 with Harvard, Cornell and Pennsylvania finishing in that order. The Navy plebes defeated the Pennsylvania freshmen in a dual race and Cornell won the 150-lb. event with Pennsylvania and Princeton tied for second and M.I.T. fourth. On the same day, at New York, Columbia and Rutgers reversed the results of their first meeting, Columbia winning the varsity race by three-quarters of a length in 7:56.4 and the Rutgers junior varsity winning from the Columbia freshmen by one-half length. Distance—one and three-quarters miles. In the west, California opened its season against Stanford at two miles on the Oakland estuary, Oakland, Calif. California won all three races, varsity, junior varsity and freshman over green Stanford crews.

On May 8 Princeton, Pennsylvania and Columbia met on the Severn river, Annapolis, Md. at one and three-quarters miles, for the Childs Cup. Navy and M.I.T. were added starters. Princeton won the cup but finished third behind Navy, the winner in 9:41.3, and M.I.T. Pennsylvania was fourth and Columbia fifth. The Harvard, M.I.T. and Cornell 150-lb. crews met on the same day at one and five-sixteenths miles on the Charles river. Harvard won handily with M.I.T. second and Cornell third.

The annual Pacific coast regatta between Washington and California was held on May 15 over the three-mile Oakland estuary course. The Washington varsity, hard hit by losses to the armed forces, trailed by seven and one-half lengths at the finish. The winning time of the good California crew was 15:02.5. There was no junior varsity race. Washington won the two-mile freshman race by two-tenths of a second in 10:14. Cornell and Navy rowed their annual dual race over the one-and-three-quarters-mile Severn river course, Cornell winning the varsity event by a deck length in 9:48 and the freshman race by one-tenth of a second in slow time. Navy won the junior varsity race easily by two lengths.

On May 22 the California varsity defeated the University of California at Los Angeles varsity over a 2,000 metre course at Los Angeles in a dual regatta by six lengths in six minutes flat, and the California junior varsity won from the U.C.L.A. junior varsity by two lengths in 6:18.

During the summer several of the rowing schools took advantage of the Navy V-12 program to hold crew practice through the summer and early fall. As a result Navy and Columbia held an informal race on Sept. 4, varsity crews only, over the one-and-five-sixteenths-mile Severn river course at Annapolis. Navy won by one-half length in the first intercollegiate crew race in which Navy V-12 students participated.

On Oct. 9 the Harvard and M.I.T. crews rowed a dual regatta at one and five-sixteenths miles on the Charles river, M.I.T. winning the varsity and junior varsity races for their first victory on record over like Harvard crews. The M.I.T. varsity was but one second off the course record of 6:40. Harvard won the 150-lb. and freshman races, bringing the 1943 season to a close.

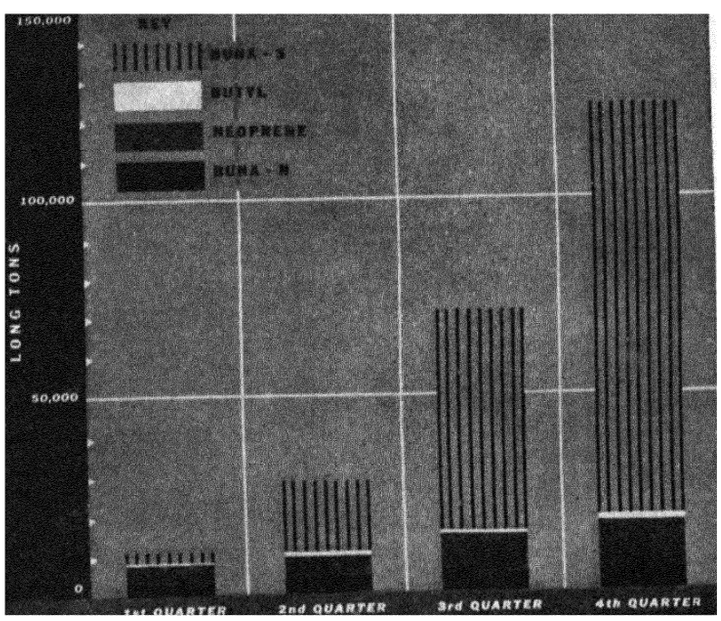
Rubber. The main task facing the U.S. rubber industry at the beginning of 1943 was that of speeding the conversion of products from natural to synthetic rubber in order to reduce the consumption of the former sufficiently to conform to the amount currently obtainable. From cultivated areas in the United States, about 1,120 tons of guayule rubber were produced in 1943. This, together with increased production of rubber from trees growing wild in tropical America and Africa, increased the annual U.S. receipts of natural rubber to approximately 67,200 short tons. Additional quantities from Africa and rubber obtained by abnormally intensive tapping in Ceylon supplied England's requirements of the natural product. Development of cryptostegia plantations in Haiti was vigorously pushed, but little rubber was expected from this project until late 1944. Although industry and the rubber director's staff co-operated fully in making these conversions, the stock pile on Dec. 31, 1943, had dwindled to only half of that a year prior to that date.

RAW RUBBER being unloaded from a river boat at Manáos, Brazil, in 1943. Brazilian wild rubber contributed increasingly to the stock pile of the United States and its Allies during the year

The scrap and spare tires collected by the government in 1942 and 1943 supplied adequate material for all reclaimed rubber needed during the year and furnished about 12,000,000 usable tires, one-third of which were utilized in conserving the stock of new tires. On Sept. 30, 1943, sufficient scrap was available for 18 months' requirements of reclaimed rubber at the then current rate of consumption.



The most serious task of the rubber director's office was bringing into production the government factories for the manufacture of butadiene and styrene, and plants for converting these into GR-S rubber, as well as plants to produce neoprene and butyl rubber. The total capacity contemplated from government plants was 952,000 short tons. On Oct. 31, 1943, the rated capacity of plants then completed was 723,520 tons, divided as follows: 655,200 of GR-S, 44,800 of neoprene and 23,520 of butyl. The output of neoprene plants had equalled expectations, and some of the GR-S plants had exceeded the anticipated rates of production. Unfortunately, the expected output of butyl rubber was not attained. Only 2,576 tons of this variety were made in 1943. As frequently occurs with new processes, difficulty was encountered in turning out raw materials and synthetic rubber of uniform quality. Considerable progress was made during the year, however, in narrowing the range of variability.

The development of required quality in goods made with GR-S calls for increased supplies of certain other materials less essential for products made with natural rubber. One of these, carbon black made from natural gas, is needed to produce in GR-S com-

positions a degree of strength obtainable from natural rubber without this pigment. Moreover, since GR-S compositions generate more heat than natural rubber when repeatedly flexed, truck and bus tires made with GR-S and cotton cords fail at abnormally low mileages. Cords of special high-tenacity rayon proved to be far superior to cotton in resisting the effects of heat, and the production of serviceable tires of these large sizes from synthetic rubber depended on the use of rayon cords. Plants producing carbon black, high-tenacity rayon and certain essential auxiliary chemicals were enlarged or converted during 1943 in order to supply the increased amounts which would be required in 1944 for the synthetic rubber program.

The use of extenders, materials possessing a degree of rubberiness, which when mixed with synthetic rubber in considerable proportions ostensibly improve its processing characteristics without detracting from the excellence of the vulcanized material, rose rapidly and then waned equally suddenly in 1943 when it was found that the service of compositions containing extenders was in many cases not satisfactory. Some extenders, however, possess value with synthetic rubber.

In order to reduce the amount of new rubber used, more stringent restrictions were imposed in the issuance of permits for the purchase of tires for replacement purposes, and retreading was encouraged by making available increased quantities of camelback (re-capping material). The wear on passenger cars of retreads containing no new rubber, early specified as a conservation measure, proved so unsatisfactory that about 40% synthetic was added to retreading materials. The resulting improvement in quality not only reduced the amount of retreading material required, but by prolonging the life of recapped tires postponed the replacement with new tires of rubber in other parts of the structure. Distribution of camelback in 1943 totalled 226,000,000 lb., compared to 105,000,000 lb. in 1942. Other conservation measures were the banning of new rubber, both natural and synthetic, completely from articles for which other materials could be satisfactorily substituted, and in many others restricting the amounts of new rubber permissible. The successful accomplishment of this program was secured by exchange of information among the technical staffs of the rubber manufacturers through a co-ordinator in the rubber director's office. Unfortunately tires, the product using the greatest tonnage of rubber, were among the most difficult to convert. Passenger car tires containing GR-S rubber, when driven at conservative speeds, will render long service; but bus and truck tires of similar compositions, because of their thicker walls and heavier loadings, heat excessively and up to the end of 1943 had required from 10% to 30% of natural rubber to produce serviceable quality. As additional means of conserving tires in use, driving pools for workmen and car speeds not exceeding 35 m.p.h. were strongly urged. Lack of butyl rubber for use in auto tubes made necessary the use of some natural rubber for this purpose also.

ESTIMATED U.S. PRODUCTION of synthetic rubber by types in 1943

Estimates of total supplies and consumption of rubber were modified during 1943. In January it appeared that the stock pile at year's end would be but 116,480 tons; in May the estimate was 159,040 tons. A report from the rubber director's office on Nov. 10, 1943, based on nine months' operation, predicted an inventory of 229,600 tons; which, though less than half of the inventory a year previous, was about double the January estimate.

The need of submitting to practical trial many promising suggestions for the improvement of synthetic rubber by modifying either the manufacturing procedure or the composition of polymerizable mixtures, and the desirability of thorough evaluation of these and other rubber-like materials led the rubber director to provide a plant where new ideas and new rubbers might be subjected to careful examination to determine their real value. Buildings to house a government-owned pilot plant and evaluating laboratory were erected in Akron, Ohio during 1943. (*See* also BUSINESS REVIEW; CHEMURGY; PETROLEUM; RATIONING.)

Rumania. A kingdom in southeastern Europe. Area on Jan. 1, 1941 *c.* 74,000 sq. mi.; pop. *c.* 16,000,000. Capital, Bucharest. Principal cities: Bucharest (648,162); Yassy (104,471); Galatz (102,232); Timisoara (89,872). Religion, mostly Greek Orthodox. King (1943): Michael (Mihai); prime minister: Gen. Ion Antonescu (*q.v.*).

History.—Little news penetrated from Rumania to the outside world in 1943—less concerning internal conditions than from any other axis satellite. The dictatorship of Gen. Ion Antonescu continued, yet the opposition in the country seemed to gain in strength, especially in connection with the German retreat in the U.S.S.R. and the allied successes in the Mediterranean. By the end of 1943 the Russian armies were approaching the territory which Rumania had annexed in 1941 when, as an ally of Germany, she had helped invade soviet Russia. This territory, 16,000 sq.mi. between the rivers Dniester and Bug, had been organized as a Rumanian province, Transnistria. The Russian advance not only threatened the Rumanian control of Transnistria, but also raised the claim of soviet control over Bessarabia, the land between the rivers Dniester and Pruth, and northern Bukovina which Rumania had been forced to cede in 1940 to the U.S.S.R.

Of the major German satellite countries Rumania was probably the most unhappy in 1943. She was not only more directly threatened by the Russian advance than any other, but was also involved in a bitter dispute with another satellite, Hungary, over Transylvania, a province of Rumania which in 1940 had been divided, on Germany's order, between Hungary and Rumania, both of which claimed control over the whole province. Of all the satellites, perhaps with the exception of Finland, Rumania took the most active part in the war against the U.S.S.R., and her army suffered exceedingly heavy losses before Stalingrad and in southern Russia at the time of the retreat of the invading forces. The whole political and economic life of Rumania was under German control and was made entirely subservient to the German war effort.

FLYING AT CHIMNEY HEIGHT, a fleet of 175 U.S. Liberator bombers raided Rumania's Ploesti oil refineries Aug. 1, 1943, causing huge damage to Germany's chief source of fuel

In the beginning of 1943 a plot of the Iron Guard against Antonescu's regime was discovered, numerous arrests were made and a number of leaders of the projected uprising were executed. On Jan. 10, Ion Antonescu conferred with Adolf Hitler at the latter's field-headquarters. Antonescu was accompanied by his nephew and deputy premier Mihai Antonescu. The official communiqué maintained that a full agreement of opinion with regard to the conduct of the war had been reached. Yet war weariness continued to spread in 1943. Leaders of the opposition, like Dr. Julius Maniu, head of the Transylvanian peasant party, tried to organize the opposition in the country. In mid-April Prime Minister Antonescu again visited Chancellor Hitler in Berlin. Though the official communiqué did not mention it, the meeting probably dealt with the growing bitterness in Hungarian-Rumanian relations and with the need for increased production in Rumania, especially in the field of oil.

U.S. bombers had bombed the oil fields and oil refineries in Rumania from their bases in the middle east. About 175 big bombers took part in a low-level raid on Ploesti Aug. 1 which cost about 20% of the planes, but caused great damage to the oil fields there.

Agriculture, Minerals and Trade.—Rumania is predominantly an agricultural country. The few industries which exist, like flour milling, brewing and distilling, are directly connected with agriculture. The chief crops of the country are maize, wheat, barley, rye and oats. The principal minerals are petroleum and natural gas, iron and copper ores, salt and lignite. The output of natural gas in 1937 amounted to 62,175,022,462 cu.ft.; the output of crude oil amounted in 1938 to 7,286,000 short tons, while it decreased, in spite of all German efforts, to 5,511,000 tons in 1942. In 1940 only 1,532,000 tons of petroleum were exported, as against 3,075,000 tons in 1939.

The monetary unit is the leu, nominally 10 milligrams gold (.900 fine). In 1938 the total imports amounted to 18,767,000 lei, the exports to 21,532,000 lei. The chief importing countries were Germany, Czechoslovakia, Great Britain, France and Italy, while the chief exports went to Germany, Great Britain, Czechoslovakia, Italy and France.

The estimated ordinary revenue for 1942–43 amounted to 71,200,000,000 lei, the expenditure to 72,500,000,000 lei. The public debt on April 1, 1939, was 104,127,428,054 lei. (*See* also WORLD WAR II.) (H. Ko.)

Ruml Plan: *see* TAXATION.

Rundstedt, Karl Rudolf Gerd von (1875–), German army officer, was born Dec. 12 at Aschersleben, descendant of a noble family of Brandenburg. He served in Alsace and Poland during World War I and acquired military fame in 1939 during the Polish campaign. He was in command at the fall of Cracow, Lodz and Przemysl. The battles of the river San and the bend of the Vistula, and the entry into Warsaw were further milestones in Gen. Rundstedt's career. For these accomplishments and for his successes during the invasion of the Low Countries and France in 1940 he was created marshal of the reich July 19, 1940. Rundstedt commanded the southern group of German armies in the Russian campaign of 1941, suffering the first major German defeat of World War II at Rostov. He was shifted to France in 1942 and put in command of the Atlantic coast defenses and the forces occupying France. On Nov. 27, after the French fleet was scuttled at Toulon, Hitler made Rundstedt military ruler of France. He continued during 1943 to strengthen defenses against the expected second front attack. Late in 1943 he conferred with Field Marshal Erwin Rommel.

Rural Electrification. The electrification of rural areas in the United States, which progressed at an accelerated rate after the establishment of the Rural Electrification administration in 1935, continued during 1943 at a reduced rate because of the war and the resulting shortage of critical materials for new line construction. War regulations were

liberalized during the year so that electric service could be extended to qualified farms, as certified by local war boards, for use in war food production activities and in alleviating rural labour shortages. As a consequence, many farmers who had been wanting electric power in order to step up their food production and to replace labour that had gone into military service and war factories applied for service. During the year there was a significant increase in the use of electricity in the production of foods, particularly milk, poultry and livestock, and in the processing and preservation of foodstuffs. In June 1943 the average farm connected to an REA-financed power line used 14 kw. hr. more electricity than in June 1942. It was estimated that approximately 2,500,000 farms were receiving central station service on Dec. 31, about 41% of the total, in comparison with approximately 2,420,000, or 39.7%, at the end of 1942.

The growth of rural electrification is shown by the approximate number and percentage of electrified farms, as follows: Dec. 1934, 744,000, 10.9%; June 1936, 840,000, 12.3%; June 1937, 1,070,000, 15.8%; June 1938, 1,300,000, 19.1%; June 1939, 1,513,000, 22.1%; June 1940, 1,870,000, 27.1%; June 1941, 2,126,000, 34.9%; June 1942, 2,337,000, 38.3%. A considerable part of the accelerated progress after 1935 was accounted for by rural electric, non-profit co-operatives. Nearly 95% of the loans of the Rural Electrification administration were made to these quasi-public co-operative enterprises which were essentially community-owned and -operated enterprises, governed by boards of directors selected by the consumer members.

By the end of 1943 Rural Electrification administration had allotted approximately $474,000,000 to finance on a self-liquidating basis the construction of nearly 420,000 miles of distribution lines and other electric facilities to serve nearly 1,375,000 rural consumers. At the close of the year, 810 systems had in operation 388,000 miles of line serving over 1,080,000 consumers in comparison with 378,000 miles serving 1,012,000 consumers at the end of 1942. To a considerable extent, this increase reflected the recognition given electric power as a farm production tool by the war agencies charged with allocation of critical materials. Approximately 80% of the consumers were farms; the balance consisted of non-farm residences, industrial and commercial enterprises, and community institutions. During 1943 the rural electric co-operatives increased their financial stability, as was indicated by payments in advance of due date of about $14,000,000 on their debts to the government in contrast to about $175,000 overdue more than 30 days at the year end.

On REA-financed systems in the heavy food-producing states, for instance, the average monthly use of power per consumer increased up to 26 kw.hr. over the previous year. Many essential war activities such as military establishments, air beacons, mines and industrial plants located in rural areas were dependent on electric service for their operation.

Wider application of electric power to farm operations continued to receive considerable attention of research agencies and others although many new developments in electrical farm equipment were not manufactured because materials were not made available. To meet their need for equipment for food production there was an active interest in homemade equipment and many farmers were making items of electrical equipment that were no longer available in the markets, such as stock tank heaters and brooders for chickens and pigs. (R. T. B.)

Russell Sage Foundation. This foundation was established in 1907 by Mrs. Russell Sage for the improvement of social and living conditions in the United States. It has an endowment of $15,000,000. It conducts studies aimed through the spreading of information to help in correcting adverse living conditions on the one hand and in promoting healthful and helpful conditions on the other. About 65% of its income in 1943 was devoted to work carried on by its own staff; the remainder was granted to work by other agencies.

The foundation had published well over 100 books and over 200 pamphlets by 1943. Among its publications were: *The WPA and Federal Relief Policy,* by Donald S. Howard; *Social Work Year Book,* edited by Russell H. Kurtz; *A Study in Public Relations,* by Harold P. Levy, and *Salaries and Qualifications of Child Welfare Workers,* by Ralph G. Hurlin.

The offices of the foundation are at 130 E. 22nd st., New York city. (S. M. Ha.)

Russia: *see* Union of Soviet Socialist Republics.

Russian Literature. Throughout 1943 literature in the soviet union continued to be dominated by the war. Themes connected with World War II or with Russia's past ousted practically everything else. Soviet writers looked upon their work as part of the total war effort. The bulk of this war literature took the form of short stories, front sketches or publicistic articles. Among the collections of stories one of the most memorable is Nikolay Tikhonov's volume of stories about Leningrad during the siege. A novel by Arkady Perventsev, *Ispytanie* (*The Ordeal*), deals with the evacuation of an aircraft factory from the war zone to the Urals. No soviet author had so far attempted to give a picture of the war as a whole in a large-scale novel, but Sholokhov was said to be engaged on a vast war epic.

There were also many war plays. Korneychuk's *Front* is interesting rather for its subject-matter than for its literary or dramatic qualities. It portrays the conflict between two different mentalities among Red army generals: the old, smacking of revolutionary "romanticism" of the civil war, and the new, realistic and scientific. Leonov's two plays—*Nashestvie* (*Invasion*) and *Lenushka* (described as "a popular tragedy")—are memorable and intense creations. In both, the action is set in the front zone: in the former, in a German-occupied town; in the latter, among soviet guerrillas. Both verge rather dangerously on melodrama. There is a curious synthesis, in Leonov, of Dostoievski and Gorky, and the war seen through this double prism assumes a strange "Goya-esque" aspect.

Among historical novels one must mention *Ivan Grozny* (*Ivan the Terrible*) by V. Kostylev and *Brusilovsky proryv* (*Brusilov's Breakthrough*) by Sergeyev-Tsensky. Less monumental than the author's earlier epic of the Crimean war (*The Ordeal of Sevastopol*), the latter deals with the Russian summer offensive of 1916 and its background in epic and objective tones.

Patriotic motives prevailed also in soviet poetry. Many poets were writing patriotic songs which enjoyed great popularity, but one agrees with N. Aseyev, one of the older soviet poets, who thought the general level of this war poetry not very high. A long semi-narrative, semi-lyrical poem by Vera Inber about wartime Leningrad (*Pulkovsky meridian—The Meridian of Pulkovo*) belongs to that author's best. Boris Pasternak, the greatest of the living soviet poets, made a new translation of *Romeo and Juliet.*

It is necessary to note the revival of émigré literature with its centre in New York. A new quarterly review (*Novy Zhurnal*) succeeded in rallying many former collaborators of the Parisian *Sovremenniya Zapiski.* Its first five issues contained unpublished stories by Bunin (who in 1943 was in France), the beginning of a new historical novel by M. Aldanov (*Istoki—The Fountainhead*) with Bakunin as one of the characters, and some new work by V. Nabokov-Sirin, which includes a daring but felicitous at-

tempt to write the concluding scene of Pushkin's unfinished verse drama *Rusalka*. (G. St.)

Russian S.F.S.R.: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Rutledge, Wiley Blount, Jr. (1894–), U.S. jurist, was born July 20 in Cloverport, Ky. He attended Maryville college, Tenn., received his B.A. degree from the University of Wisconsin, 1914, and his law degree from the University of Colorado, 1922. He was admitted to the Colorado bar in 1922 and practised in Boulder. He was professor of law at the University of Washington, 1926–35, and professor of law and dean of the law college at the University of Iowa, 1935–39. Regarded as an outstanding legal scholar and widely known for his liberal views, he was nominated associate justice of the U.S. court of appeals for the District of Columbia in April 1939, and entered his new duties the following month. On Jan. 11, 1943 President Roosevelt named him to fill the U.S. supreme court vacancy left by the resignation of Justice James F. Byrnes. Justice Rutledge, who was only 48 years old at the time, was the second youngest member of the court. (Justice William O. Douglas, the youngest member, was then 44.)

Ryder, Charles W. (1892–), U.S. army officer, was born Jan. 16 in Kansas. After graduating from West Point, 1915, he was commissioned a 2nd lieutenant. During World War I he fought on the western front, was cited for extraordinary heroism and was awarded a number of decorations. After the war he was stationed in China and served for awhile in military intelligence. Commanding the force that landed at Algiers on Nov. 8, 1942, Major General Ryder negotiated surrender terms with the French garrison commander 16 hours after the initial landings. For his "exceptionally meritorious service" in Algeria he was awarded the distinguished service medal, Dec. 31, 1942. After the Tunisian victory it was announced that Gen. Ryder had commanded the 34th national guard division in the drive on Bizerte.

Rye. The 1943 rye crop was estimated by the U.S. department of agriculture at 33,314,000 bu. compared with 57,341,000 bu. in 1942 and a 10-year average (1932–41) of 38,589,000 bu. This decrease was due to a much lower yield per acre, 11.6 bu., than in 1942 when it was 14.9 bu., as well as a drastic reduction in acreage of almost 1,000,000 ac., or about 75%. This change resulted from a shift of acreage by farmers to other crops believed to be more essential in the war period. The 1943 goal set by the War Food administration was only 90% of 1942. Stocks of old rye were in strong demand at the end of 1943 because of the general feed shortage. (J. C. Ms.)

U.S. Production of Rye in Leading States, 1943 and 1942

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
South Dakota	5,220,000	13,872,000	Ohio	1,140,000	1,870,000
Nebraska	5,052,000	5,926,000	Oklahoma	897,000	1,188,000
North Dakota	4,014,000	10,082,000	Michigan	748,000	1,160,000

St. Louis. Eighth largest city of the United States, St. Louis, Mo., had a population of 816,048 by the federal census of 1940, with an additional 541,567 persons living within the greater metropolitan district. Mayor (Jan. 1, 1944): Aloys P. Kaufmann (Rep.).

While 5,000 spectators watched at Lambert-St. Louis field Aug. 1, 1943, a glider towed in an army air force anniversary demonstration lost a wing and crashed. Among the 10 occupants killed were Mayor William Dee Becker (elected in 1941), the city's deputy comptroller, the director of public utilities and Thomas N. Dysart, president of the St. Louis Chamber of Commerce. Aloys P. Kaufmann, 40, who three months earlier had been elected president of the board of aldermen, succeeded Becker as mayor.

St. Louisans voted (April 6, 1943) for aldermen by wards, instead of at large, for the first time since 1914. Republicans gained a 21-to-7 majority in the board of aldermen by winning 8 seats, plus the presidency, while the Democrats won 7.

During 1943 the city adopted a redistricting plan to equalize the 28 wards in size and population, levied a 2-cent tax on each package of cigarettes (expecting $750,000 yearly revenue), and tentatively planned a $60,125,000 postwar improvement program.

The beginning of the 1943–44 fiscal year (April 12, 1943) found St. Louis not only with a balanced budget for the first time since 1928, but with a surplus of $513,174. Bonded indebtedness was $62,720,500; legal borrowing power, $115,696,701; assessed valuation of real and personal property, $1,074,810,000; tax rate (city, state and schools), $2.75 on $100, and the city budget (for all purposes), $34,205,760. Salazar, António de Oliveira (1889–), Portuguese statesman, was born at Santa Comba Dão (Coimbra) on April 28, 1889. In 1916 he became professor of economics at Coimbra university. Shortly after the revolution of May 1926, the Portuguese president, General Carmona, invited him to join the government as finance minister; he accepted the post, but, finding himself unduly restricted, resigned within a week. Less than two years later, after stipulating that complete freedom within his department should be given him, he reassumed office on April 27, 1928. In 1930 Dr. Salazar founded the civil organization known as the National Union. On July 5, 1932, he became president of the council of ministers; in the following year the new corporative constitution of the Portuguese republic was submitted to the country in a plebiscite and a national assembly elected. In 1936 Dr. Salazar assumed the portfolios of war and foreign affairs.

Several weighty speeches were made by Dr. Salazar during 1943, but his outstanding pronouncement was the comprehensive broadcast made on the 15th anniversary of his appointment as finance minister (April 27, 1943). Of the British alliance he said: "We did not fail to reaffirm it at a dark and difficult moment." Of Spain: "In the policy of friendship with her we have found precious support which bore fruit in what has been termed the Peninsular Bloc." Of neutrality: "It is not maintained without care, effort and expense. . . . Except . . . in the still outstanding incident of Timor, our neutrality has been respected by all; and I believe that we too have honoured it." (*See* PORTUGAL.)

Sales, Retail and Wholesale: *see* BUSINESS REVIEW.

Salt. The production of salt in the United States in 1942 increased 8% over 1941, to 13,693,284 short tons. Of the total, 7,373,165 tons were in the form of brine, 3,517,832 tons in evaporated salt, and 2,802,287 tons in rock salt. Purely industrial uses took 9,839,191 of the total, while the food industry and table use accounted for 1,963,457 tons.

In Canada the 1942 output was 653,672 short tons, 17% more than in 1941, while that of the first 8 months of 1943 was 7% greater than for the same period of 1941. (G. A. Ro.)

Salvador, El. A republic on the west coast of Central America, without a Caribbean littoral. It is the smallest Central American republic (area 13,176 sq.mi.) but the most densely populated per square mile (pop., off. est. 1939, 1,744,535). Capital: San Salvador (pop., 1939 census, 105,494). Other cities are: Santa Ana (86,667); San Miguel (46,569); Santa Tecla (34,313); Ahuachapán (32,220); Sonsonate (21,484); San Vicente (30,000); Zacatecoluca (28,081). The prevailing religion is Roman Catholic. President in 1943: Gen. Maximiliano Hernández Martínez.

History.—El Salvador continued war policies as developed in 1942. The state of siege, started at the beginning of the war and continued every 90 days, remained in effect in 1943.

Economic conditions in the first part of the year were less favourable than later. In August the exportation of basic foodstuffs was prohibited, and the ban was not lifted until November. A price control plan was established Sept. 2, covering some 50 items. Some profiteering had been in evidence before this time. Wages in all industries had been raised by October, except for government employees. The gasoline shortage was serious in El Salvador, with at least 35% of all private cars with no allowance at all, and with bus traffic down 50%.

Education.—Primary schools in 1941 numbered about 1,300, with an average attendance of approximately 75,000. Secondary schools numbered 26; enrolment 1,650. The 1943 budget estimated educational expenses at 2,246,000 colones (1942: 2,211,000).

Finance.—The monetary unit is the colón (value in 1943, 40 cents U.S.). The 1943 budget estimated revenue at 23,901,000 colones; expenditures at 23,896,000 colones. The public debt (July 1, 1942) was 44,947,000 colones (39,132,000 colones external; 5,815,000 colones internal). The gold reserve was estimated at near 35,000,000 colones. Because of a shortage of small coins, United States dimes were made legal tender in September (at 25 centavos, one-fourth of a colón).

Trade and Resources.—No figures for 1943 on total trade were available; imports and exports for 11 months of 1943 had increased over 1942, however. Coffee, normally 90% of exports, was estimated at 917,690 bags for 1942–43; the quota was increased during the year from 753,578 bags to 1,064,264 bags and would be filled from stocks on hand. Total national production in 1942 was estimated to value $55,362,000 (agriculture 82.5%, industry 15.5%, mining 2%). Principal crop estimates were as follows: cotton 68,140 quintals; cottonseed 6,500 tons; sugar 412,600 quin.; castor beans 2,000 tons; sesame 1,000 tons, rice 23,000 tons. The favourable trade balance with the United States for nine months of 1943 was $9,947,000.

Communication.—Communication by sea improved in 1943. Air service was supplied by TACA and Pan American Airways. Railway mileage was estimated at 375 mi., highways at 3,700 mi. (1,600 mi. unimproved).

BIBLIOGRAPHY.—Dana D. Munro, *The Five Republics of Central America* (1918); Chester Lloyd Jones, *The Caribbean since 1900* (1936).

Salvage Drives, U.S. The War Production board, through its Salvage division, actively engaged over 16,000 volunteer salvage committees operating through homes, farms and industry throughout cities, counties and states. In addition to these volunteer workers, national and local organizations such as the Boy Scouts, American Legion, Salvation Army, Kiwanis clubs, etc. were mobilized for the purpose of generating and collecting salvage materials needed for essential purposes during the war. Normal trade channels were used to the utmost at all times, and all types of waste material dealers contributed to the collection, segregation and preparation of these materials.

U.S. Salvage Collected in 1943
(in net tons)

Item	Amount
Tin cans	255,513
Collapsible tubes	2,380
Household fats	43,919
Waste paper*	6,066,554
Iron and steel scrap†	26,207,000

*Consuming mill receipts.
†Consumers' receipts.

The principal scrap materials sought in 1943 were: *Iron and steel scrap,* the flow of which had to be maintained to meet the greatest all-time total in steel production the United States has ever known.

Wastepaper.—The paperboard industry encountered difficulties because of shortage of manpower necessary to produce wood pulp and pulpwood. A wastepaper collection effort was intensified and an impending disaster averted by putting innumerable publicity forces to work and by arranging for the collection and disposition of wastepaper in counties and communities throughout the U.S.

Used household fats and greases were a subject of considerable salvage effort. Late in 1943 the OPA arranged to give two meat points for each pound of fat returned to the butcher. By virtue of this and other efforts, the collection of waste fats increased.

Tin was made available in quantity because of the collection of tin cans, automobile radiators, and collapsible tubes used for toothpaste, shaving cream, etc. The tin cans served a double purpose, furnishing both steel and tin once they were returned to detinning plants. The collapsible tubes, while not providing steel, did make available a substantial amount of tin.

Collection of silk and nylon hosiery was discontinued during 1943, but only after 2,964,656 lb. had been obtained for use in making powder bags, parachute lines and other similar articles.

Copper scrap was moved at a greatly accelerated rate because of salvage efforts in automobile graveyards, industrial plants, public utilities and other sources. (*See* also IRON AND STEEL; RUBBER; WAR PRODUCTION, U.S.) (H. M. Ft.)

Salvation Army. An army of 5,000,000 workers attacked the problem of human needs in 98 countries in 1943: 20,667 hospitals, lodging places and other centres throughout the globe served humanity in 1943: many of the Salvation Army's 27,417 officers—each an ordained minister—marched with Allied forces on 23 fighting fronts. When faced, during the great depression in Britain, with thousands of hungry persons the Salvation Army put cooking facilities in a few trucks and motored to meet the need. From this simple, direct action grew the mobile canteen. In 1943 the Salvation Army had 500 mobile canteens on 24-hour call throughout Britain alone.

Meeting emergency needs led to the establishment of rehabilitation homes for inebriates, hospitals for unmarried mothers, prison parole activities, free or low-cost lodging places, boys' clubs and fresh air camps and all the rest of the social services.

In 1943 all these were continued in the United States without let-up, in spite of added war services.

The year was marked by increased efforts to meet the rising child delinquency needs, overcrowding of the 178 lodging places, increased strain on the 42 maternity homes and hospitals.

Workers in 1,867 organized centres in the U.S. continued all religious services, also the knitting and sewing for persons in-or-out of uniform. The personal visitation to the sick and bereaved and the giving of cheer baskets increased. Considerable attention was given to migrant wives of service men.

The year witnessed an increase in emergency war services, not only in the U.S. but, through the global network of Salvation Army centres and canteens (called Red Shield units), to Americans and Allies on 23 fronts. The Salvation Army, through its international organization, provided $1,000,000 for war service in the Australian area alone. Advancing with MacArthur's men, Red Shield workers established 13 recreational centres in New Guinea.

The Red Shield work, originating in 1899, included in 1943 more than 2,000 clubs in the war zones and an untotalled number of mobile canteens and foot marchers. Red Shield workers in 1943 carried the Salvation Army flag back onto Italian territory with the invasion forces; it had been banned during the fascist regime.

In the United States, in 1943, the number of Red Shield units rose to 160. The number of service centres assigned by the United Service Organizations, Inc., for operation by the Salvation Army (one of its six constituent agencies) rose to 167.

(E. J. Pa.)

Samoa, American. A group of six islands and one uninhabited coral atoll in the South Pacific, a U.S. possession by virtue of a tripartite treaty with Germany and Great Britain regulating the disposition of the Samoan archipelago, concluded in Nov. 1899. Area, 76 sq.mi. Pop. (1940) 12,908. The capital is Pago Pago, on the island of Tutuila. The six inhabited islands are Tutuila, Aunuu, Ofu, Olosega, Tau and Swains. The uninhabited coral atoll, Rose Island, is located 70 mi. east of its nearest neighbour.

American Samoa is governed by a naval officer, commissioned as governor by the president. There is a native governor in each of the three administrative divisions of American Samoa; and these native governors appoint the county chiefs, who select the village chiefs. The natives are of the Polynesian race and more than doubled in numbers during the period of American rule. In 1943 there were 36 public schools with an enrolment of about 3,000, and 6 private mission schools.

The chief product of American Samoa is copra, of which about 1,100 tons are exported annually. The islands are fertile and well watered and produce taro, breadfruit, yams, coco-nuts, pineapples, oranges and bananas. About 70% of the land consists of forests.

Construction of a naval air base at Pago Pago was started in 1940. While news of further air and naval development was restricted in the interest of military secrecy, American Samoa became an important and valuable link in the chain of naval and air bases between the west coast and Hawaii and Australia, New Zealand and the combat theatres of the South Pacific.

Sand and Gravel. The United States production of sand in 1942 was 107,371,000 short tons, and of gravel 196,975,000 tons, a total of 304,346,000 tons; these are respectively increases of 3%, 6% and 5% over 1941. Building construction took 46% of the sand, road paving 36%, foundries 8%, and railroads used 4%, partly as ballast, and partly as engine sand. Of the gravel output building took 24%, paving 59% and railroad ballast 12%. (G. A. Ro.)

Sandstone: *see* Stone.

San Francisco. Twelfth United States city, San Francisco, Calif., had a population in 1940 of 634,536, federal census. Estimates by the San Francisco department of public health placed the population at 775,000 in July 1943. Mayor (Dec. 31, 1943): Angelo J. Rossi (Roger D. Lapham, mayor-elect, took office Jan. 8, 1944).

In the manufacturing industries of the San Francisco industrial area, employment rose 46% and payrolls 68% during 1943, and were 231% and 500%, respectively, above the 1940 prewar level. The 11 months' cumulatives for 1943 for San Francisco revealed new records established, with financial transactions up 27%, postal receipts 47%, retail trade 20%, wholesale trade 9%, carloadings 16%, cost of living 7%, and general business activity up 21%. Retail sales in 1943 were estimated at over $1,000,000,000, wholesale trade at $2,500,000,000, and manufacturing at nearly $2,000,000,000.

Proclaimed the nation's foremost shipbuilding centre for the war program and one of the principal ports of military embarkation, the San Francisco area shipbuilding industries in 1943 employed more than 150,000 workers and had since 1940 been awarded contracts for 790 ships and other shipbuilding facilities totalling $2,250,000,000.

San Francisco's funded debt on Sept. 30, 1943, was $125,054,100, leaving an actual margin for future bond issues of $102,804,510. The complete budget for the 1943–44 fiscal year amounted to $95,601,035 with total tax charges of $36,760,949. Total assessed valuation for the 1943–44 period was $1,176,221,757. Tax rate for the same period was $4.36 per $100 assessed valuation. Tax delinquency for the fiscal year ended June 30, 1943 was at an all-time low of 0.76%, and the lowest in the U.S. among large cities. (R. B. Kr.)

São Tomé: *see* Portuguese Colonial Empire.

Saracoglu, Shukru (1890?–), Turkish statesman, was born in Odemis, Turkey. He was educated in Turkish civil service schools and studied law at Lausanne university, Switzerland. He enlisted in the Turkish army during World War I, joined with Mustafa Kemal Pasha (Kemal Ataturk) after the armistice and fought against the Greek forces in 1921. After the destruction of the Greek armies and the abolition of the sultanate, Saracoglu became a member of the national assembly as deputy from Izmir, and rose swiftly in the ranks of Mustafa Kemal's party. An advocate of westernization for Turkey, he instituted many legal reforms during his tenure as justice minister, 1932–38. After Ataturk's death in Nov. 1938, Saracoglu was named foreign minister. He followed a consistent policy of neutrality during the first years of World War II. In July 1942, he was named prime minister. After the re-election of President Inönü in March 1943, Saracoglu headed a reorganized cabinet.

Sarawak: *see* British Empire.

Saskatchewan. The central of the three Canadian prairie provinces, Saskatchewan was created a province in 1905 by the Canadian parliament. Area, 251,700 sq.mi, comprising open country in the south, and broken wooded land in the north. Pop. (1941 census) 895,992. Local administra-

tion is in the hands of a provincial parliament. The chief cities of Saskatchewan (population based on the 1941 census) are as follows: Regina, provincial capital (58,245); Saskatoon (43,027); Moose Jaw (20,753); Prince Albert (12,508); Weyburn (6,179). Saskatoon is the seat of the University of Saskatchewan, a provincial institution.

History.—In the general elections of 1938, William Patterson, the Liberal premier, had been returned to office; there was no change of political importance in 1943. Saskatchewan returns to Ottawa 21 members to the house of commons and six senators.

Agriculture, Forests, Fisheries.—In 1943 the wheat crop was expected to reach about 155,000,000 bu., or about one-half of the 1942 crop. Other crops (computed as of Nov. 1943) were as follows: oats 23,747,991 bu.; barley 14,771,214 bu.; flaxseed 8,460,299 bu.; sunflower seed 8,700,000 bu. Sunflower seed was distinctly a wartime production, the commodity having great industrial and food value. As in previous years, there was difficulty in finding labour for harvesting in 1943. The problem was met by moving in some 2,000 farmers and farm labourers from central Canada. The forests of Saskatchewan in 1941 produced lumber to the value of $3,322,733; the fur haul for 1941-42 represented the sum of $2,245,275. (J. I. C.)

Schlesinger, Frank (1871–1943), U.S. astronomer, was born May 11 in New York city. He was educated in New York, receiving his B.S. from City college, 1890, and his M.A., 1897, and Ph. D., 1898, from Columbia. An authority on determining stellar distances by photography, Dr. Schlesinger, while astronomer at Yerkes observatory, 1903–05, developed a method of measuring distances between stars on photographic plates taken with long-focus telescopes. He also designed a measuring engine to make his computations on distance more precise; this device is now regarded as standard equipment in observatories. While director and professor of astronomy at the Allegheny observatory, University of Pittsburgh, 1905–20, he designed a photographic telescope with 30-inch lens. He was director of Yale university's observatory from 1920 until his retirement in 1941. He died at Lyme, Conn., July 10.

Scientific Research and Development, Office of.

The Office of Scientific Research and Development (OSRD) was created in the Office for Emergency Management (*q.v.*) by executive order 8807 of June 28, 1941. Dr. Vannevar Bush of the Carnegie institution of Washington was appointed director. Within the OSRD were set up the National Defense Research committee (NDRC) and the Committee on Medical Research (CMR), the former to assist the director of the OSRD in the mobilization of the scientific personnel and resources of the U.S., and the latter to advise and assist with special reference to the medical personnel and resources of the U.S. The NDRC operated as a committee of the Council of National Defense from June 27, 1940, until June 28, 1941, during which time it entered into a number of contracts which were assumed by the OSRD.

As in preceding years the OSRD in 1943 operated largely through contracts with scientific laboratories in academic and industrial establishments. Of the 364 separate contractors, 119 were academic institutions and 245 industrial establishments. Most of the work of the OSRD was started at the direct request of the armed services. Practically all of it was of a confidential nature, which made it impossible to reveal details. In May 1943 it was stated that more than 200 devices or formulas developed through OSRD had been turned over to the armed services and that many of them were being used against the enemy. Army and navy orders for OSRD-developed equipment placed through May 1943 aggregated more than $2,000,000,000. The congressional appropriation to support OSRD activities for the fiscal year ending June 30, 1944, was $135,982,500. (I. ST.)

Sculpture.

The art of sculpture faced a difficult period in 1943 as a result of the increased demands of the war upon manpower and materials. Many sculptors turned to war work; and others, especially those of the younger generation, were drawn into the armed services. Individual sculpture production and exhibition activity were consequently much curtailed; and what continuation of work there was was carried on largely by the older artists. On the whole there appeared few opportunities or incentives to important or large-scale activity.

A main restrictive factor was the drastic limitation of the use of metal for sculpture work. With bronze, nickel, aluminum and other sculpture materials imperatively needed for armament production, the casting of sculpture in metal was reduced to an almost negligible quantity, leading bronze founders in some instances to estimate depreciation of normal production by as much as 90% to 100%. Sculptors however turned to work in stone, wood and terra cotta, or simulated bronze for temporary purposes by colouring fragile plaster; but small figures and portraits were the rule and little monumental work was completed during the year.

Exhibition activity thus was limited somewhat, largely to the showing of previously completed work and to new productions in the less enduring earth mediums. Most noteworthy among the exhibitions were several shows of the work of individual sculptors. A comprehensive display of architectural and decorative sculpture by Carl Milles, noted Swedish-born sculptor, was presented in May by the American Academy of Arts and Letters which further signalized the artist's achievement by awarding him the academy's medal of merit and $1,000 prize for 1943. Several original pieces were shown but the exhibition was limited by wartime transportation problems mainly to large photographs of Milles's principal plastic achievements.

In January there was another notable showing made by the Whitney Museum of American Art (since amalgamated with the Metropolitan museum) of the work of the museum's late founder, the sculptor Gertrude Vanderbilt Whitney. Arranged as a memorial, it consisted of small bronzes and more monumental work in stone, bronze and other material and illustrated much of the artist's entire production from 1905 to 1940. The sculpture, largely traditional in style, was beautifully shown and very sympathetically received by the public. Maria Martins, wife of the Brazilian ambassador, had a stimulating show of modern sculpture early in the year at the Valentine gallery in New York, demonstrating sources of inspiration in the primitive folklore of her native land, and a robust style in its interpretation. Another show of similar character, exhibiting technical authority and power, presented a well known French refugee sculptor, Jacques Lipchitz, at the Buchholz gallery in February. Both events introduced recent work with fresh trends in ideas.

One of the most popular and entertaining groups was that of

Alexander Calder, American modern sculptor, who had a large retrospective display of his work at the Museum of Modern Art in September. Consisting of "mobiles" and "stabiles" it contained fascinating and light-hearted creations in abstract forms, some of them motivated by electrical power and others susceptible of movement by a breeze of air. Hundreds went to see these brightly painted, animate objects in metal and wood which the artist had created during a period of about 15 years.

The National Sculpture society made its major moves in two group exhibitions representing traditional art forms. One was the annual bas-relief exhibition, in which Miss Janet de Coux of Philadelphia received the Lindsey Morris memorial prize for medallic sculpture, her subject being a design for a "China service medal." Tenth in a series devoted to small relief sculpture, the exhibition was made by 42 members of the society from New York and other cities. The other presentation during this period was a display of enlarged photographs of important American sculpture at the New York Historical society. It was entitled "American Patriots" and designed to show the quality of the best public sculptural monuments to national heroes such as Washington, Lee, Theodore Roosevelt, John Paul Jones and Admiral Farragut. Many of the society's famous members, past and present, were represented by these statues in many cities throughout the country.

A few public monuments, commemorative busts and memorials, were completed during 1943 and dedicated in different cities. In Washington two busts of statesmen were unveiled under official auspices, one being a bust of the late Thomas B. Reed, onetime speaker of the house, by the late Gutzon Borglum, which was dedicated in the house of representatives last January; and a bust of John N. Garner, former vice-president, unveiled in a ceremony at the capitol in April. A five-ton granite statue of Mary Todd and Abraham Lincoln by Frederick C. Hibbard, was provided as a gift to the city of Racine, Wis., and was erected in that city. Other sculpture projects included a bronze portrait of Prof. Albert Einstein, noted scientist, completed by the New York sculptor Eleanor Platt, which was to be presented to the Hebrew university in Palestine after World War II by a group of American friends of the university and of the scientist.

Museum acquisitions included notable sculpture. The National Gallery of Art in Washington received the gift of an 18th century French terra cotta statue entitled "La Surprise," by Claude Michel (called "Clodion"), from Mrs. Jesse Isidor Straus in memory of her late husband who was American ambassador to France from 1933 to 1936. The Metropolitan Museum of Art also acquired a distinguished 12th century stone lintel, depicting in deeply carved relief the Holy Women of the Sepulchre and the Entombment of Christ. The sculpture was a gift to the museum's branch, The Cloisters, from John D. Rockefeller, Jr., and is one of the largest single pieces of mediaeval carving in the United States. Secondary Metals.

Information available on the recovery of secondary metals in the United States is presented in the accompanying table. All metals in the list show clearly the effect of increased demand, to supplement primary production in the war program. Some of these metals are recovered from junked materials, but with increased industrial activity an increasing percentage comes from scrap made in the fabricating plants, and so has never been in use.

Nonferrous metal scrap shipped to consumers by dealers in 1942 totalled 951,057 short tons, including 488,436 tons of copper, 306,192 tons of lead and tin, 100,796 tons of aluminum, 50,435 tons of zinc, 3,297 tons of nickel and 1,871 tons of magnesium. At the end of the year dealers' stocks were 112,142 tons, against 90,928 tons at the beginning of the year and a low of 77,776 tons in February. Through Aug. 1943, similar shipments increased by 5% over the corresponding period of 1942, to 646,225 tons.

Secondary Nonferrous Metals Recovered in the United States

*Ratio of secondary recovery to consumption of new metal; where a second figure appears, this is the percentage of the total secondary metal recovered from *old* materials, the remainder having come from the reworking of new plant scrap.
†Includes some in chemical compounds. ‡Other platinum group metals.

The consumption of ferrous scrap in the United States in 1942 showed an increase of 2% over 1941, with a total that reached 60,251,151 short tons—a new record high; in this total was 33,129,322 tons of plant scrap and 27,135,779 tons of purchased scrap. During the first eight months of 1943 plant scrap amounted to 20,715,000 tons and purchased scrap to 15,856,000 tons, both small increases over the same period of 1942. There was a shortage of scrap throughout the year, as is indicated by these figures; in normal operation plant scrap and purchased scrap are used in about equal quantities. At the end of Aug. 1943, only about two months' supply was on hand. During the fourth quarter an intensive drive for the collection of all kinds of metal scrap was under way. (G. A. RO.)

Secret Service, U. S.

Because its "Know Your Money" campaign cut counterfeit money losses 97% in six years, the treasury department's secret service in 1943 applied the same principles to a "Know Your Endorsers" campaign, designed to prevent thefts and forgeries of government checks by exposing the methods of check thieves and forgers to their potential victims. Seeking to protect recipients of nearly 200,000,000 government checks issued during the fiscal year, representing army and navy allowances and allotments, social security benefits and other federal payments, secret service agents arranged for publication of news stories and warnings against check forgers in newspapers and magazines with a com-

bined circulation of 204,922,409 and for the production and distribution of 596,774,346 copies of pamphlets, placards and other material printed by banks and private business establishments. The inscription: "Know Your Endorser—Require Identification," now being printed on government checks, was widely adopted by banks, corporations and state and local governments for use on private checks, at the suggestion of the secret service.

The 32-page secret service booklet, "Know Your Money," was adopted as a unit of study by 11,922 high schools throughout the United States, for study by 3,396,687 students under the guidance of 72,784 teachers. The "Know Your Money" study course was formally endorsed by the Americanism Commission of the American Legion, and a group of its educators compiled a comprehensive course of study which they sent to 6,000 high school teachers and post commanders with the request that "Know Your Money" be made a part of the curricula of high schools in their communities. The "Know Your Money" film was shown to 2,103,918 persons, including 1,265,925 high school students.

In protecting the president of the United States, secret service agents were faced with new problems during his unprecedented journey to Casablanca in January. Movements were executed according to careful advance arrangements and were kept a closely guarded secret until the news was officially released. Great care was also taken to insure the president's security during his trip to Mexico and his unpublicized inspection tours of the war plants of the nation, one of which took him through more than 20 states.

During the year plants for the production of counterfeit $1, $10 and $50 notes were captured by agents, who also seized 8 metal counterfeit plates, 30½ metal molds and 137½ plaster molds for all denominations of bogus coins, 36 film negatives, 1 glass negative for counterfeit Canadian gasoline ration stamps, 2 power presses and one hand press, 16 zinc plates for counterfeit "B" gasoline ration stamps, 20,859 counterfeit sugar ration stamps, 27,102 counterfeit "T" gasoline ration stamps, 14,180 counterfeit U.S. internal revenue stamps and 1,110 counterfeit Canadian excise stamps.

Agents seized counterfeit and altered notes with a total representative value of $44,909. Of this amount, $13,572 was captured before it reached circulation. Of the balance, only $22,079 represented losses suffered by victims of counterfeit note-passers.

Counterfeit coins seized had a representative value of $20,783, of which $1,340 was seized before they reached circulation. Of the balance, $16,309 represented losses to the public.

During the year there were 26,892 investigations disposed of. A total of 1,789 offenders were arrested, and convictions were obtained in 98% of the 1,515 criminal cases brought to trial.

Securities and Exchange Commission.

As of June 30, 1943, the commission was composed of the following members: Chairman Ganson Purcell and Commissioners Robert E. Healy, Sumner T. Pike, Edmund Burke, Jr., and Robert H. O'Brien. The commission's headquarters were located at Philadelphia, Pa., and regional offices were located at Atlanta, Ga.; Baltimore, Md.; Boston, Mass.; Chicago, Ill.; Cleveland, O.; Denver, Colo.; Fort Worth, Tex.; New York, N.Y.; San Francisco, Calif.; and Seattle, Wash. A liaison office was maintained in Washington, D.C. The several acts administered by the commission are discussed below.

During the fiscal year ended June 30, 1943, 150 registration statements were filed with the commission under the Securities act of 1933, which provided for the filing of financial and other information concerning securities proposed to be offered to the public, bringing to 5,176 the total number of registration statements filed under the act to that date. One hundred fifteen registration statements became effective during the year, registering securities in the aggregate amount of $659,480,015.

Under the Securities Exchange act of 1934, providing for the regulation of securities trading practices both on securities exchanges and in the over-the-counter markets, 19 national securities exchanges were registered with the commission at the close of the year, and 6 exchanges were exempted from registration. There were 2,244 issuers who had 3,866 separate security issues listed and registered upon national exchanges. There were 4,913 brokers and dealers who engaged in the over-the-counter securities business registered with the commission; the registrations of 24 brokers and dealers were revoked by the commission, and 4 applications for registration were denied. The National Association of Securities Dealers, Inc., with a membership of 2,221 at June 30, 1943, and having powers of self-discipline over its membership, remained the only such association registered with the commission.

On June 30, 1943, 129 holding companies with consolidated assets aggregating $16,079,000,000 were registered with the commission under the Public Utility Holding act of 1935. There were 1,217 holding, sub-holding, and operating companies included in the system companies registered with the commission. Between Dec. 1, 1935 (when the registration requirements of the act became effective), and Nov. 15, 1943, public utility holding companies disposed of their interests in 223 electric, gas, and non-utility companies with assets of approximately $3,233,000,000. Necessary corporate reorganization and simplification, as well as a more equitable distribution of voting power, was approved or ordered by the commission during the year in cases involving 29 companies and action by 12 major holding company systems to effect compliance with the integration requirements of the act was also ordered.

During the year the commission participated, under Chapter X of the Bankruptcy act, in the reorganization proceedings for 130 companies having total assets of approximately $93,770,000 and aggregate indebtedness of approximately $70,693,000.

Under the Trust Indenture act of 1939, 45 indentures covering securities of an aggregate principal amount of $399,800,429 were filed with and examined by the commission.

Three hundred ninety investment companies were registered with the commission as provided in the Investment Company act of 1940, on June 30, 1943, with estimated assets aggregating approximately $3,000,000,000. The act provided for the protection of investors through disclosure of finances and investment policies of these companies. Three important court actions were instituted under the act during the year. Two of these actions alleged gross misconduct and gross abuse of trust by the companies' managements; one case resulted in an adjudication in bankruptcy, and the other, involving three companies, was awaiting trial on the merits. The third action was based upon an abandonment of the company by its management, leaving an "orphan" trust, and in that case a liquidating receivership was obtained.

The registrations of 698 investment advisers were in effect at the end of the year under the Investment Advisers act of 1940.

During the year 1942–43, 947 cases of alleged fraudulent securities transactions were under investigation by the SEC; 48 companies and individuals were permanently enjoined from continuing practices violative of provisions of the acts administered by the commission; and 189 persons were indicted and 127 convicted for fraudulent activities violative of said acts. Sedition: *see* FEDERAL BUREAU OF INVESTIGATION.

Seeing Eye, The This organization, which teaches dogs to guide blind persons, began in 1928 when Morris Frank brought his German shepherd, Buddy I—bred and trained by Mrs. Harrison Eustis and Elliott S. Humphrey in Switzerland—to New York and proved that American street traffic could not baffle the expert animal. In 1943, some 800 blind men and women, from every state in the union, were using dogs educated by the Seeing Eye at Morristown, N.J., and were thus made capable not only of earning their livings but of helping their country, 100 of them directly in war industries. Many dog-reliant blind persons were using their second or third dogs; for a dog's life is short, and Seeing Eye guarantees not to let slip back into dependency anyone whom a guide dog has once set free.

After Pearl Harbor, Seeing Eye resolved to "at no expense to the federal government, endeavour to provide Seeing Eye dog guides for eligible persons who . . . have lost their sight in line of duty." Only a few of 1943's graduates were blinded soldiers; but Morris S. Frank, guided by "Buddy," visited 39 army, navy and veterans' hospitals, telling how the newly blinded can learn to live again. (B. TA.)

Seismology. Seismology adapted itself to war conditions, especially to the fact that so much of the major earthquake belts are in active war zones. An unknown number of observing stations were destroyed or forced to suspend. However, the principal earthquakes were located and information was supplemented by study of the instrumental record at distant stations. While there was no major earthquake there were about 10 in which loss of life or property occurred, Turkey suffered most with three earthquakes of which the most severe was on Nov. 27, 1943. One new seismograph station was established in the United States and one in Mexico. Several suspended operation. Two stations were maintained in Greenland. There was co-operation in the location of earthquakes from Greenland, Canada, the United States, Mexico, Colombia, Peru, Samoa, New Zealand and Australia. Records were obtained in the central regions of several slightly destructive earthquakes, especially that of San Jose, Calif., on Oct. 25.

Results of earlier investigations were published which confirmed the accuracy of strong motion measurements and provided means for their utilization in the design of structures to resist earthquake damage. Some vibration measurements were made to aid in solution of problems of structural design.

No geodetic resurveys were made to determine crustal movements possibly associated with earthquakes but new surveys provided many additional points for use in future determinations. Tilt measurements continued but no earthquake occurred to test their value. No seismic sea wave was recorded on the tide gauges of North and South America. No purely investigation work was undertaken, but this was offset by the probable development of new devices which might prove useful. The activities of international seismological organizations was reported as continuing on a curtailed basis. (*See* also DISASTERS.) (N. H. H.)

Selective Service, U.S. On Dec. 1, 1943, the Selective Service system reported that the combined strength of the U.S. armed forces was estimated at 10,100,000 men and women. At the same time, Selective Service said it estimated it would be required to call between 1,900,000 and 2,100,000 more men by July 1, 1944, to bring the military establishment up to its planned strength of 11,300,000 and to supply the replacements for those who would die and those who would be discharged.

The year 1943 imposed a severe burden on the Selective Service system and the 190,000 people, mostly volunteer workers, who carried out its work. These people, working on appeal boards, as advisory board members, government appeal agents, medical and dental examiners, re-employment committeemen, and on the 6,437 local boards were the real administrators of the program.

From its inception in Sept. 1940, until Feb. 1943, the Selective Service system called men for the army only. On Feb. 1, 1943, however, to carry out the provisions of an executive order of Dec. 5, 1942, the system began to furnish all men inducted into the navy, marine corps and coast guard as well as the army. Assignments for general service men were made on ratios determined by the needs of the respective services.

The requirement that all men between 18 and 38 needed by all of the armed forces should be inducted through Selective Service channels imposed an additional task on Selective Service local boards. It had one definitely beneficial effect, however. Prior to Feb. 1, 1943, when Selective Service was furnishing men for the army only, it was not unusual for men to be enlisted by the navy even after they had been classified as available for army service. Therefore, local boards might believe that they had a certain number of men available for forwarding to an army induction station on a given date. When the roll was called, however, they were likely to find that some of the men had enlisted in the navy and that the army requirements would not be met that day. That procedure adopted in Feb. 1943, prevented this situation from occurring.

While the reduction in the age limit from 45 to 38 curtailed the manpower pool in 1943 to a considerable degree, there was another factor that substantially reduced the supply of available men. On Dec. 31, 1943, Selective Service announced that 1,750,000 men had been deferred in Classes II-C and III-C, the former for men regularly engaged in an agricultural occupation or endeavour but without dependents, the latter for men so engaged but also having dependents. Of the 1,750,000 some 397,000 were between 18 and 22 years of age and were non-fathers. At the same time, only 122,500 men between 18 and 22 who were non-fathers were deferred because of occupations in war production or war supporting activities.

Under the executive order of Dec. 5, 1942, the Selective Service became a part of the War Manpower commission and operated as a bureau of the commission until Dec. 1943, when congress, in legislating amendments to the Selective Training and Service act of 1940, included a provision which stated that the president could delegate his authority under the act to the director of Selective Service only. On Dec. 23, 1943, the president issued an executive order setting up the Selective Service system as a separate agency again, and once more delegated his authority to the director of Selective Service.

On May 1, 1943, there were approximately 8,000,000 18 to 38 year-old registrants deferred because of their dependency. Two months later, on July 1, 1943, the total number of registrants deferred because of dependency had been reduced to 6,600,000 as the increasing demands of the armed forces necessitated the calling of men who had collateral dependents or wives only.

Then on Aug. 3, the chairman of the War Manpower commission announced that local boards should begin the reclassification of fathers who had been deferred because of the dependency of their children and that the induction of such fathers would begin Oct. 1, 1943. By Jan. 1, 1944, Selective Service announced that 99,000 registrants having children conceived prior to Dec. 8, 1941, or

Other classes	165,619	152,001	13,018	0.8	0.8	0.6	165,069	152,897	12,172	0.7	0.8	0.5

so-called pre-Pearl Harbor fathers had been inducted into the armed forces between Oct. 1 and Jan. 1. Furthermore, the pool of men deferred because of their dependents on Dec. 1, 1943, had been reduced to 4,500,000 and local boards were continuing the reclassification of such registrants at a rate between 750,000 and 1,000,000 per month.

Many of the registrants who had been deferred because of their children, however, were not placed in a class available for service but were reclassified into deferred classes by reason of their occupations in war production or in support of the war effort. In Oct. and Nov. 1943, 1,400,000 fathers were classified out of their dependency classification. Of that number, 900,000 were immediately placed in other classifications and deferred by reason of their occupations, indicating that local boards were continuing to follow the Selective Service policy of deferring men with children as long as possible.

Congress, in 1943, made two major legislative moves for the benefit of men with dependents.

The first was adopted on Oct. 26, 1943, when the Serviceman's Dependents Allowance act of 1942 was amended to increase the amounts payable to dependents of men in the armed forces.

As amended, the Serviceman's Dependents Allowance act provided:

SEC. 101. The dependent or dependents of any enlisted man in the army of the United States, the United States navy, the marine corps, or the coast guard, including any and all retired and reserve components of such services, shall be entitled to receive a monthly family allowance for any period during which such enlisted man is in the active military or naval service of the United States on or after June 1, 1942, during the existence of any war declared by congress and the six months immediately following the termi-

*Excludes registrants born prior to Dec. 1, 1905.

nation of any such war.

SEC. 102. The monthly family allowance payable under this title to the dependent or dependents of any such enlisted man shall consist of the government's contribution to such allowance and the reduction in or charge to the pay of such enlisted man except as to the initial family allowance provided by section 107 (a) thereof.

SEC. 103. The dependents of any such enlisted man to whom a family allowance is payable under the provisions of this title shall be divided into three classes to be known as "Class A," "Class B," and "Class B-1" dependents. The Class A dependents of any such enlisted man shall include any person who is the wife, the child, or the former wife divorced of any such enlisted man. The Class B dependents of any such enlisted man shall include any person who is the parent, brother, or sister of such enlisted man and who is found by the secretary of the department concerned to be dependent upon such enlisted man for a substantial portion of his support. The Class B-1 dependents of any such enlisted man shall include any person who is the parent, brother, or sister of such enlisted man and who is found by the secretary of the department concerned to be dependent upon such enlisted man for the chief portion of his support.

SEC. 104. A monthly family allowance shall be granted and paid by the United States to the Class A dependent or dependents of any such enlisted man upon written application to the department concerned made by such enlisted man or made by or on behalf of such dependent or dependents. A monthly family allowance shall be granted and paid by the United States to the Class B or Class B-1 dependent or dependents of any such enlisted man upon written application to the department concerned made by such enlisted man, or upon written application to the department concerned made by or on behalf of such dependent or dependents in any case in which the secretary of the department concerned finds that it is impracticable for such enlisted man to request the payment of such allowance. The payment of a monthly family allowance to any Class B or Class B-1 dependent or dependents of any such enlisted man shall be terminated upon the receipt by the department concerned of a written request by such enlisted man that such allowance be terminated.

SEC. 105. The amount of the monthly family allowance payable to the dependent or dependents of any such enlisted man shall be—

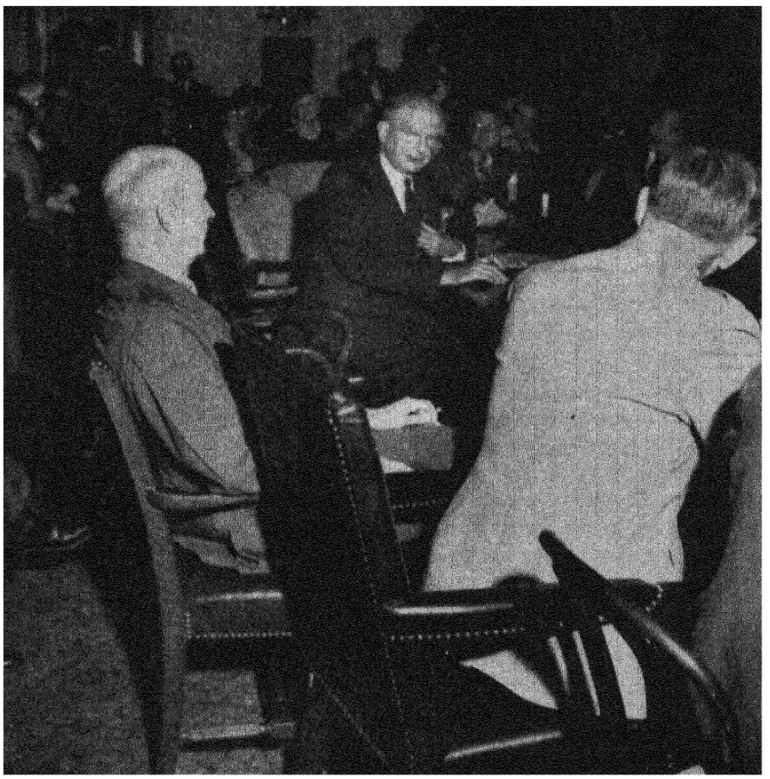
To Class A dependent or dependents: A wife but no child, $50; a wife and one child, $80, with an additional $20 for each additional child; a child but no wife, $42, with an additional $20 for each additional child; a former wife divorced but no child, $42; a former wife divorced and one child, $72, with an additional $20 for each additional child.

To Class B dependent or dependents, payable only while there is no allowance payable to any Class B-1 dependent, $37.

To Class B-1 dependent or dependents: One parent but no brother or sister, $50; two parents but no brother or sister, $68; one parent and one brother or sister, $68, with an additional $11 for each additional brother or sister; two parents and one brother or sister, $79, with an additional $11 for each additional brother or sister; a brother or sister but no parent, $42, with an additional $11 for each additional brother or sister.

SEC. 106. (a) For any month for which a monthly family allowance is paid under this title to the dependent or dependents of any such enlisted man the monthly pay of such enlisted man shall be reduced by, or charged with, the amount of $22, and shall be reduced by, or charged with, an additional amount of $5 if the dependents to whom such allowance is payable include more than one class of dependents. The amount by which the pay of any such enlisted man is so reduced or with which it is so charged shall constitute part of the monthly family allowance payable to his dependent or dependents.

(b) Whenever a division is made of payments of monthly family allowance among dependents of a class, the total amount payable under the provisions of section 105 of this title to or for the benefit, respectively, of two or more children, of two parents, of a former wife divorced and one or more children, or of two or more brothers and sisters, shall be equally divided among the respective children, parents, former divorced wife, or brothers and sisters, or shall be otherwise apportioned and paid within the respective groups as the secretary of the department concerned may direct. The monthly family allowance to Class B dependents shall be payable to only one designated dependent unless the secretary of the department concerned shall direct that the prescribed amount be apportioned among and paid to two or more of such dependents.



(c) Notwithstanding any other provisions of this title, in any case in which a family allowance is granted under this title—

(1) to a wife living separate and apart from the enlisted man under a permanent or temporary court order or decree or written agreement, the amount of the family allowance payable to such wife shall not exceed the amount provided in such order, decree, or written agreement to be paid to such wife, and if such order, decree, or written agreement provides no amount to be paid to such wife, no family allowance shall be payable to her; or

(2) to a former wife divorced, the amount of the family allowance payable to such former wife divorced shall not exceed the amount fixed in the court order or decree as the amount to be paid to such former wife divorced.

In any case in which the application of the provisions of this subsection results in payment to a dependent or dependents of an enlisted man in an amount less than $22, the amount by which the pay of such enlisted man is reduced or with which it is charged shall be the amount of such payment. In every other case in which application of this subsection alone or in conjunction with other provisions of this title results in a payment or payments of $22 or more the amount of such reduction or charge shall be as provided in subsection 106 (a).

Another major move made by the congress for the benefit of registrants with children was the adoption on Dec. 5, 1943, of amendments to the Selective Training and Service act, of 1940, as amended, which provided that in so far as possible fathers should not be called until available non-fathers were called.

SENATOR BURTON K. WHEELER (centre) testifying against the drafting of U.S. fathers in 1943, at a joint session of the senate and house military affairs committee

This provision, however, stipulated that the induction of fathers should not be delayed if such action would interfere with the calling of men required by the armed forces.

The amendments also eliminated the listing of so-called nondeferrable occupations and the induction of men with dependents by reason of the fact that they engaged in nondeferrable activities and occupations. Under this practice, certain registrants, such as bartenders, night club employees, etc., had been inducted, without regard to their dependency status, unless they changed from their nondeferrable occupation to one not listed as nondeferrable.

The legislation also provided for the appointment by the president of a five-man medical commission which was charged with responsibility of investigating the physical, mental and moral standards for admission to the armed forces. It also was requested to investigate the situation with respect to use of limited service personnel in the armed forces and to make recommendations to the president as to whether or not additional numbers of limited servicemen could be utilized by the armed forces without impairing their effectiveness.

One section of the amending legislation provided for pre-induction physical examination at the request of registrants whose induction was shortly to occur. In order to give effect to that section, Selective Service in conjunction with the war and navy departments, put into effect a revised procedure for physical examination. The new procedure provided that instead of a registrant's being inducted immediately after passing his physical examination at the induction station and thereafter being sent home as an enlisted reservist on inactive duty, for 21 days in the case of the army and 7 days in the case of the navy, the registrant would be given a pre-induction examination. If he passed it, he was not to be inducted immediately but was to be returned home in a civilian status and would not have to report for induction until at least 21 days after his examination, regardless of whether he was to be inducted into the army or the navy. Although this procedure was to go into effect on Feb. 1, 1944, in order to commence building up the pools, registrants were to be ordered to report for pre-induction examinations during January in addition to registrants being ordered to report for induc-

tion under the old procedure until Feb. 1, 1944. It was hoped that sufficient numbers of persons would be given pre-induction examinations long enough before their actual induction so that by building up large enough pools a period in excess of the initial 21 days could be granted.

The amending legislation also contained a provision that in all cases where a registrant was employed in a Selective Service appeal board area which did not encompass the area of his local board and he was deferred by reason of his occupation, his case should be referred to the appeal board of his principal place of employment for review. This action was taken by the congress with the expressed intent of curtailing the deferment by local boards of men employed in areas far distant from their place of registration.

One of the most far-reaching moves made by Selective Service was the announcement that after Feb. 1, 1944, no registrants between 18 and 22 years old would be granted occupational deferments except in certain cases approved by the director of Selective Service or state directors or in the case of certain students, the merchant marine, and the army transportation corps.

Re-employment.—As the total size of the military establishment increased in 1943, so too did the number of discharges from the armed forces, either through normal attrition or through the casualties of war.

In the Selective Training and Service act of 1940, as amended, is the provision that men who have satisfactorily completed their training and service and who are physically able to return to their former employment shall be returned if it is possible for their former employer to rehire them. The act also provides for the creation within the Selective Service system of a division to carry out the re-employment provisions.

The re-employment division of the Selective Service system decentralized its operation down to the local level and to each local board there was assigned at least one re-employment committeeman responsible for obtaining re-employment benefits of the act for the veterans in his local board. The committeemen also was to work with the representatives of other agencies, government and private, interested in the employment and rehabilitation of men discharged from the armed forces.

In 1942 some 80,000 men were discharged from the military establishment as unfit for further service. By Dec. 31, 1943, the number had been increased to 750,000, of whom 200,000 had been discharged from army and navy hospitals as complete disability cases. Of the latter, 62% were reported on Dec. 31 to have been employed, rehabilitated, or as not requiring assistance. The remainder were reported to be in process of being employed, or rehabilitated, or for other reasons their cases were unclosed. Of those who sought to return to their old jobs, only one sought redress in the courts, as provided in the Selective Training and Service act of 1940, as amended, because his former employer refused to rehire him. But that case did not go to the trial stage because when the former employer was advised of that possibility, he rehired the man and paid him back wages.

The re-employment provisions of the Selective Training and Service act apply not only to men discharged from the armed forces but to the women as well and to men of the merchant marine.

In the accompanying tables the classification of registrants 18 to 37 years of age is shown. The selective service classifications listed and their meaning are, Class I-C, member of land or naval forces of the United States; Class IV-F, physically, mentally or morally unfit for service; Class I-A, available for military service; Class I-A-O, available for noncombatant military service (conscientious objector); Class I-A(L), available for limited military service; Class I-A-O(L) available for limited noncombatant service; Class III-A, formerly deferred by reason of maintaining bona fide family relationship (dependency); Class III-B, formerly deferred by reason of dependency and activity (this class was abolished but a few registrants therein had not been reclassified in Dec. 1943); Classes II-A and II-B, man necessary in support of war effort, and man necessary in war production; Class II-C, man deferred by reason of his agricultural occupation or endeavour; Class III-C, man deferred both by reason of dependency and agricultural occupation or endeavour; Class III-D, man deferred by reason of extreme hardship and privation to wife, child or parent.

Pay.—The Pay Readjustment act of 1942 which in 1943 applied to the WACS, WAVES, SPARS and Marines, established uniform rates of base pay for enlisted men of the army, navy, marine corps and coast guard.

The act provided:

> The monthly base pay of enlisted men of the army, navy, marine corps and coast guard shall be as follows: Enlisted men of the first grade, $138; enlisted men of the second grade, $114; enlisted men of the third grade, $96; enlisted men of the fourth grade, $78; enlisted men of the fifth grade, $66; enlisted men of the sixth grade, $54; and enlisted men of the seventh grade, $50. Chief petty officers under acting appointment shall be included in the first grade at a monthly base pay of $126.

Selenium. The production of selenium in the United States in 1941 increased 85% over 1940, to 681,650 lb., but dropped back to 316,613 lb. in 1942, 14% less than in 1940. The United States and Canada are the main contributors to a world output estimated at 600 short tons, smaller producers being Russia, Japan, Rhodesia, Mexico and possibly Sweden.

(G. A. RO.)

Selincourt, Ernest de (1870–1943), British educator and writer, was born Sept. 24 in Streatham, England. He was educated at University college, Oxford, and was a lecturer on English language, literature and poetry at Oxford, Cambridge, Belfast and Birmingham universities. At the latter school he served also as dean of the faculty of arts, 1919–30, and as vice-principal, 1931–35. Dr. de Selincourt collected, arranged and edited the voluminous correspondence between William Wordsworth and his sister, Dorothy. Six volumes were devoted to these letters, one was published in 1935, two in 1936 and three in 1938. He wrote a biography, *Dorothy Wordsworth* (1933), *Oxford Lectures on Poetry* (1934) and edited *Wordsworth's Poetical Works* from the manuscripts (1940), *Journals of Dorothy Wordsworth,* 2 vols. (1941), and collected and edited the works of Keats and Spenser. Dr. de Selincourt died at Kendal, Westmorland, May 22.

Serum Therapy. For the serums now used in medicine in the United States, official potency standards and tests have been established by the National Institute of Health for the following products: botulinus antitoxin, diphtheria antitoxin, Clostridium histolyticum antitoxin, Clostridium oedematiens antitoxin, staphylococcus antitoxin, tetanus antitoxin, scarlet fever streptococcus antitoxin, perfringens antitoxin, vibrion septique antitoxin, diphtheria toxin-antitoxin mixture, antidysenteric, antimeningococcic and type specific anti-

pneumococcic serums. These are the products that are known to be useful in the treatment of various diseases. Most of them are made by inoculating an animal with the germs or with the toxin or poison developed by the germs and thereafter collecting the blood from the animal and separating the serum which contains the antisubstances.

Thus the serums included cover snake-bite poisoning, botulism, diphtheria, erysipelas, gas gangrene, tetanus, scarlet fever and staphylococcic infections, also anthrax, dysentery and pneumonia.

In addition to these serums which are made by utilizing the blood of animals, serums are prepared from human blood taken from patients who have recently recovered from various diseases. These serums include the serums used against measles, scarlet fever and infantile paralysis. These are commonly called convalescent serums.

The use of serums and serum preparations is sometimes followed by reactions which are due to sensitivity of the person concerned to animal products, especially the serum of the horse. In certain cases these reactions may be avoided by the use of serums which have been altered by the reaction of enzymes or by using serums from bovine species or sheep and goats. Serums and antitoxins, unless made by the inoculation of the horse, must show on the label the species of animal used.

As a part of the war effort, serums were also being developed for use against some of the special conditions concerned in the war. These were, however, still in an experimental stage.

For pneumonia, serum is obtained from the blood of an animal which has been immunized with cultures of a pneumococcus. It was known in 1943 that there are many different varieties of the pneumococcus so that it is necessary to have a serum that is specific against the type concerned. Antipneumococcic serum obtained from rabbits has been shown to have less of certain disadvantages than does the serum obtained from horses. In 1943, by special techniques rabbit serums were made against many different types of pneumonia. (M. F.)

Sforza, Carlo, COUNT (1872–), Italian statesman, was born at Lucca. He entered the diplomatic service, was minister at Peking, 1911, and at Belgrade, 1916. He served as Italian high commissioner in Turkey, 1918 and undersecretary for foreign affairs, 1919. In 1919 he was created senator. He became minister of foreign affairs in the Giolitti cabinet June 1920, and negotiated the treaty of Rapallo between Italy and Yugoslavia, Nov. 1920. He remained foreign minister until July 4, 1921 and in Feb. 1922 was appointed ambassador in Paris. After Mussolini's accession to power, he resigned and became one of the chief leaders of the anti-fascist opposition in the senate. Following the murder of Matteoti in 1924, Count Sforza left Italy and went into self-imposed exile. He lived on the continent and travelled to the United States where he lectured frequently at American universities. In Aug. 1942, at the Italian anti-fascist congress in Montevideo, he was proclaimed leader of the newly formed Free Italian National council. After the downfall of Mussolini, Sforza, who had been in the U.S., returned to Italy, Oct. 1943. He subsequently repudiated the Badoglio government, declaring that he could not support a government which was not chosen by the Italian people. On Nov. 3, Sforza declared in a press interview that he would take a post in the Badoglio government only if King Victor Emmanuel and Crown Prince Umberto abdicated, asserting that the house of Savoy, through its close association with Mussolini, had become "obnoxious" symbols of fascism. On Nov. 20, he suggested that a regency under the six-year-old Prince of Naples would be the most appropriate reconstruction government for Italy.

Shaposhnikov, Boris Mikhailovich (1882–), Russian army officer, was born Oct. 4 in Zlatoust, Russia. He won a scholarship to the imperial academy of the general staff, was graduated in 1910 at the top of his class and was commissioned an officer in the Czarist army. In May 1918 he offered his services to the red army and was appointed an assistant commissar by Lenin and Trotsky. In 1921 he was awarded the order of the red banner. He served in the red army for 13 years before joining the communist party. In 1937 he became chief of the general staff and a member of the powerful central executive committee of the U.S.S.R. He became generally recognized as the chief strategist of the red army when he succeeded in breaking Finnish resistance in the winter of 1940. In recognition of his achievements in the Finnish campaign, Stalin conferred on him the rank of marshal in May 1940. He was said to have been the author of the three-front plan of defense against Hitler's armies in the German-Russian war, and on Oct. 31, 1941, he was recalled as soviet chief of staff. Shaposhnikov was also said to have contrived the strategy that enabled the Russians to hurl back the nazis at the Volga river and Stalingrad in 1942. National recognition of his achievements was evidenced by the nation-wide observance of his birthday on Oct. 4, 1942. In April 1943 it was announced that owing to protracted illness Shaposhnikov had been replaced as chief of staff by Marshal A. M. Vasilevsky.

Shaw, Mrs. George Bernard (?–1943), wife of the British playwright, was born Charlotte Frances Payne-Townshend, daughter of a millionaire Irishman. She and Shaw, who first met at the home of the Sidney Webbs, were married in 1898. Mrs. Shaw thereafter devoted all her time to caring for her celebrated husband, a job which, she once confided in a friend, took up one-third of her time. She was one of his valued critics and acted as his official interpreter on their visits abroad. A philanthropist and lover of music and the arts, she also translated several French plays and collected a book of selected passages from her husband's works. She died in London, Sept. 12.

Sheep. The number of sheep in the United States declined in 1942 as shown by the U.S. department of agriculture estimates of Jan. 1, 1943. This followed an increase through several years to a high record total in Jan. 1942. The total number of sheep and lambs on farms at the beginning of 1943 was 55,089,000 head compared with 56,735,000 head in 1942 and an average of 52,386,000 head for the period 1932–41. This total appeared to be about a maximum of numbers of sheep for the United States since almost equal numbers were reported in the past in 1884, 1900 and 1930. After reaching a low point of 32,597,000 in 1923, however, there was a fairly steady increase in numbers.

The 1943 lamb crop was estimated at 31,100,000 head which was about 1,500,000 head less than in 1942 and the lowest since 1939. The total sheep and lamb production of 1943 was therefore 86,189,000 compared with 87,200,000 in 1942. This decrease reflected the labour shortage in the important sheep states since weather and feed conditions were not much different in the two years.

Requirements for lamb and mutton were estimated to be 965,-

000,000 lb., or about 5.2 lb. per capita. This amount was produced in 1943 and the goal for 1944 was about 70,000,000 lb. below that amount. The War Food administration suggested goals which would maintain the total number of sheep at the level expected on Jan. 1, 1944, which was near the average of 1938–43, 52,000,000 head. (J. C. Ms.)

Shigemitsu, Mamoru (1887–), Japanese statesman, was born July 29 in Oita-ken. He received his law degree from Tokyo Imperial university. He entered the foreign service in 1911 and held minor diplomatic posts in Germany, England and the United States, 1911–18. He was a member of the Japanese delegation at the Paris peace conference, 1919, and was associated with the Japanese foreign office, 1920–24. Shigemitsu was sent abroad again, serving in China, 1925, and Germany, 1927, and was minister plenipotentiary to China 1929–30. In 1932 he was hit by fragments of a bomb hurled by a Korean patriot at Shanghai and lost a leg. He was made vice minister of the foreign office, 1933, and was appointed ambassador to the U.S.S.R. in 1936. Two years later, he was named ambassador to England. In 1941, Tokyo ordered him to leave his British post and return home; he paid a "courtesy" visit to Washington on his way back to Japan. Two days after the Japanese attack on Pearl Harbor, Shigemitsu was appointed ambassador to the puppet regime at Nanking. In April 1943, Tojo reshuffled his cabinet and selected Shigemitsu as his foreign minister. Prior to Pearl Harbor, Shigemitsu was reported in favour of Japanese co-operation with Britain and the United States and was said to be highly critical of the ruling Japanese military clique.

Shipbuilding. United States statistics on shipbuilding for the merchant marine were available to the public, but for other nations they were discontinued for the duration. Some general information on naval building in the U.S. was released, but the publishing of detailed information as to numbers and types of ships was forbidden.

Up to Dec. 1, 1943, 1,691 sea-going commercial vessels of 17,217,525 deadweight tons were delivered by the shipyards of the United States, or at an average rate, for the 11 months, of five vessels a day. The total output of seagoing commercial vessels for 1943 would approximate 19,000,000 deadweight tons, or more than twice the record production of 1942 which was 8,088,732 deadweight tons. It was known that other nations were producing commercial vessels, but their total output for the year 1943, at best, was but a small percentage of the output of the United States.

The president's message to congress on Sept. 17, 1943, in speaking of the magnitude of naval building by the industry, made the following statement:

> The number of fighting ships and auxiliaries of all kinds completed since May 1940, is 2,380, and 13,000 landing vessels.
>
> In the 2½ years between Jan. 1, 1941, and July 1, 1943, the power plants built for installation in navy vessels had a horsepower equal to all the horsepower of all hydroelectric plants in the United States in Jan. 1941.
>
> The completions of navy ships during the last six months were equal to completions in the entire year of 1942.
>
> We have cut down the time required to build submarines by almost 50%.

Losses of world merchant tonnage, due to torpedoing by submarines, aircraft bombing, mines and other casualties were greatly reduced in 1943 as compared with 1942. Statistics were not available for publication as to losses by types, sizes or tonnage.

Substantially all of the shipyard and ship repair plant facilities in the United States for the construction of new vessels and for the repair of vessels which had been projected through 1942 were completed and in production. Several building yards, which were under construction in 1942 came into operation in the early part of 1943, and were building vessels of several classes.

Shipbuilding output in the United States of both merchant and naval vessels was in 1943 at about the maximum possible with the personnel, materials, machinery and equipment allocated to shipbuilding.

A new type of ship, the Victory ship of approximately the same deadweight tonnage, but of superior design and of higher speed than the Liberty ship, was developed during 1943, and the production of a large number of them before the end of 1944 was contemplated. The ships would be 4 to 6 knots faster than the Libertys and equipped with steam turbines instead of steam reciprocating engines installed in the Liberty type.

From Dec. 30, 1941, to Dec. 1, 1943, 1,662 EC-2 type Liberty ships were delivered. These vessels were of a standard design, and sizable contracts were awarded to each yard building them. By reason of the multiple production of ships of this type, the time from keel-laying to delivery was continually reduced from month to month. The first few vessels took over 200 days to build. The records for Sept. 1943 indicated that for 106 Liberty ships built in all yards, an average time from keel-laying to delivery was only 41½ days.

More than one-third of the merchant ships produced were vessels other than Liberties. These categories were divided between oil tankers, C-type ships for the long range program and other types such as special auxiliaries, coastal cargo ships, tankers and barges.

Synthetic and substitute materials were extensively developed during the war to take the place of standard materials used in peacetime. Among the substitutions were steel for copper, plywood in place of steel for the construction of small floating craft, plastics in place of aluminum, synthetic rubber and many other materials. Some of these substitutes, of course, might be discarded after World War II. Self-propelled and non-propelled vessels of re-enforced concrete were being built.

The advantages of multiple production were only to be obtained where large numbers of vessels of the same type were built. Most of the time-saving developments were expected to disappear in normal times when only a very limited number of vessels of the same type in every respect would be under construction at one time.

Employment in the industry in the United States continued to increase, and, for the construction and repair of vessels of all types and all sizes in 1943 approximated 1,500,000, with a probable equal number employed in allied industries engaged in the making of materials and in the building of equipment for incorporation in vessels.

The employment of women in the industry was accelerated during the year and in September approximated 9½%. In general the wage rate was the same for women as for men.

In Sept. 1943 (latest statistics available) the average hourly earning rate in the industry was $1.336, the highest wage rate prevailing in any of the durable goods industries, and the average weekly earnings in the industry during that month were $63.48, on a 47.8-hour week; the next closest rate being that for "aircraft engines" which was $61.14 on a 47.2-hour work week.

Shipbuilding became an inland as well as a seacoast industry. Many of the smaller shipyards of the U.S., not only on the seacoasts, but on the great rivers and on the Great Lakes, were participating extensively in the production of smaller vessels of many types for the war effort. (*See* also SHIPPING, MERCHANT MARINE.)

(H. G. S.)

Great Britain.—The most conspicuous feature of the shipbuilding year was the greatly increased number of fast ships

built by the Allied countries. The increased success of the anti-submarine measures greatly reduced the losses, so that immediate delivery was not of such paramount importance and there was a reasonable reserve of slow ships for bulk cargoes. The construction of fast and specially designed ships had never been entirely abandoned, although for security reasons little publicity was given to it, and at the beginning of 1943 the British yards were building as many as they could without upsetting the balance of production. It was officially pointed out that it took 50% more time, material and labour to build a 15-knot ship than an 11-knotter of similar capacity.

In Britain some of the faster ships were built by individual shipowners under licence, the authorities maintaining very strict control over the design and all its features, but a considerable number were built by the government itself. Ships of extreme design, with speculative features or demanding priority material, were strongly discouraged.

The fast ships built to government order included meat ships, troop transports, etc., and these did excellent work, their design being usually a simplification of prewar practice. The latest type of which some details were officially released was a 3-deck fast cargo liner of 12,000 tons deadweight capacity and accommodation for 12 passengers, with excellent hull form for speed and seakindliness. She was fitted with excellent deck gear for handling cargo. The speed was unofficially estimated at comfortably over 15 knots. Some were propelled by double reduction geared turbines with watertube boilers burning oil fuel, while some were Diesel driven, the hull and general features being identical.

Builders in the British dominions were also turning to a faster type as their programs of standard ships were delivered. In Canada the new ships were akin to the American "Victory" type while the Australians were building a smaller and faster cargo vessel suitable for the coasting and Pacific island trade.

British shipbuilding was hampered by a most unfortunate increase in the number of labour disputes during 1943, resulting in a very large number of man-hours being lost both directly and through sectional disputes holding up the work of others. These strikes were practically all sectional and unofficial, against the advice of the workers' own unions and deliberately ignored the official measures which proved adequate for the settlement of practically every legitimate dispute. Many of the strikes were for the purpose of annulling disciplinary measures.

At the beginning of 1943 the average British shipyard worker's earnings were over 81% higher than they had been before the war, but in the late summer fresh demands for increased wages were lodged with the employers and discussed.

The proportion of women in the British yards increased and they proved capable of undertaking, with conspicuous success, a wide range of work. A great number of lads eagerly applied for apprenticeship. There was more dilution, and steady progress by agreement with the unions was made on the understanding that it was to be a war measure only in breaking down the rigid lines of demarcation.

Prefabrication and welding were employed more and more. The amount of welding was largely influenced by weather conditions but its use was increased sufficiently to alarm the riveters about the permanence of their position. Prefabrication was largely governed by the labour available. Several shipyards closed during the slump, and their machinery dispersed, were re-opened for prefabricated building.

It was officially announced that it had been agreed with the United States that, to a considerable extent, British yards should specialize in naval vessels and American in merchantmen.

Great attention was paid to the salvage of ships and their fittings and excellent work was done, keeping the repair side of the industry very busy. Improved organization of labour greatly reduced the waste while men are standing by for repair jobs, although it cannot be eliminated altogether.

TEEN-AGE BOYS were employed by some U.S. shipyards in 1943 not as trainees, but as full-time employees at standard wages

Neutral Countries.—Although practically all the neutrals were endeavouring to build ships, the only ones of importance were Spain and Sweden. In the former country they were continuing the government program laid down in 1942, covering a wide range of types, but they had to face great difficulties with both material and labour, and ships urgently required meant the suspension of work on other ships. Swedish shipbuilding, although by far the most active, was handicapped by further German arrears in the

delivery of steel plates and, after German threats to the country, by the mobilization of skilled men into the forces. Swedish shipbuilders and engineers were carrying out a great deal of experimental work for postwar types. Propellers with reversing blades were fitted in ships of unprecedented size and in view of the shortage of oil great progress was made with producer gas engines, although the most striking instance came from Denmark, where producer gas engines were put into a 3,000-ton ship.

Axis Countries.—In the axis and enemy-occupied countries, although definite information was difficult to obtain, progress appeared to have been slow in all cases in spite of the urgent need. Italy complained that her shipbuilding had been handicapped by Germany not delivering the coal and materials promised; after the armistice with Italy it was found that ships which had been described as being at sea were still far from completion. German shipbuilding appeared to have been almost entirely limited to submarines, destroyers and small naval types despite the shortage on their sea communications with Sweden and occupied territories. Danish shipbuilding had been forced almost exclusively into German work which finally so exasperated the workers that the sabotage campaign was directed largely against the shipyards. Similarly, the French had been able to obtain little material except for German work and the big Messageries Maritimes liner "Marechal Pétain," laid down in 1939, was still uncompleted in 1943. Japan had been making every effort to use the building resources of occupied territories and published huge programs of wooden auxiliaries and other small craft to relieve the full-powered steel ships with better ships built in the seized yards in Hongkong and the Netherlands Indies. (*See* also BUSINESS REVIEW.) (F. C. Bo.)

Shipping, Merchant Marine.

United States.—The end of 1943 found United States shipping and shipbuilding industries in step with other phases of war production to meet the constantly increasing output necessary after the United States was plunged into war. Movement of men and war materials from the United States and importation of strategic raw materials made ocean transportation the most vital factor in victory for the United Nations.

Revision of the United States' shipping industry and creation of the United States Maritime commission followed the Merchant Marine act of 1936, stating that the United States should have a merchant marine adequate for both the national defense and development of its foreign and domestic commerce. Vessels were to be American owned, constructed and manned and were to be the best-equipped, safest and most suitable types.

Obsolescence in the merchant marine was the chief weakness found in an economic survey in 1937. To form a steadily expanding, modern and superior fleet, the maritime commission inaugurated a long-range construction program which called for the completion of 500 vessels during the next 10 years. Without this program as a basis, the commission shipyards could not have met the demands for increased construction at the outbreak of war in Europe in 1939.

Since facilities for manufacturing geared-turbine propulsion machinery for the C-types of the construction program were overloaded, the maritime commission adapted and adopted a design called the EC-2 emergency cargo vessel, known as the Liberty ship, as the basis of its wartime merchant fleet. These vessels were powered by triple-expansion reciprocating steam engines which could be built at many plants throughout the country. The standardized design of the ship and its parts was readily adapted to fast production because of prefabrication of large sections of the ship and extensive use of welding instead of riveting. It also permitted rapid training of workers.

Important accomplishment was reduction of the national average time to build a Liberty ship from 241.3 days in Jan. 1942 to 41.2 days in Sept. 1943.

When the commission made its survey in 1937 only 10 shipyards with 46 ways capable of producing ocean-going vessels over 400 ft. long were in operation. These facilities were enlarged and new shipyards built under the direction and financing of the commission. In late 1943 approximately 70 shipyards with more than 300 ways on the east, west and Gulf coasts and on the Great Lakes were building and repairing ships. Also, during 1943 approximately 1,500 factories in about 32 states employed almost a million persons to produce equipment and accessories.

Shortages of materials, machinery and trained manpower had to be met. A centralized purchasing plan helped to eliminate competitive buying on the part of shipyards and established control over distribution of parts to shipyards. In Oct. 1943 there were around 700,000 workers, 14% of whom were women, helping to build the U.S. merchant fleet. Approximately 90% of these inexperienced employees had to be trained for their jobs.

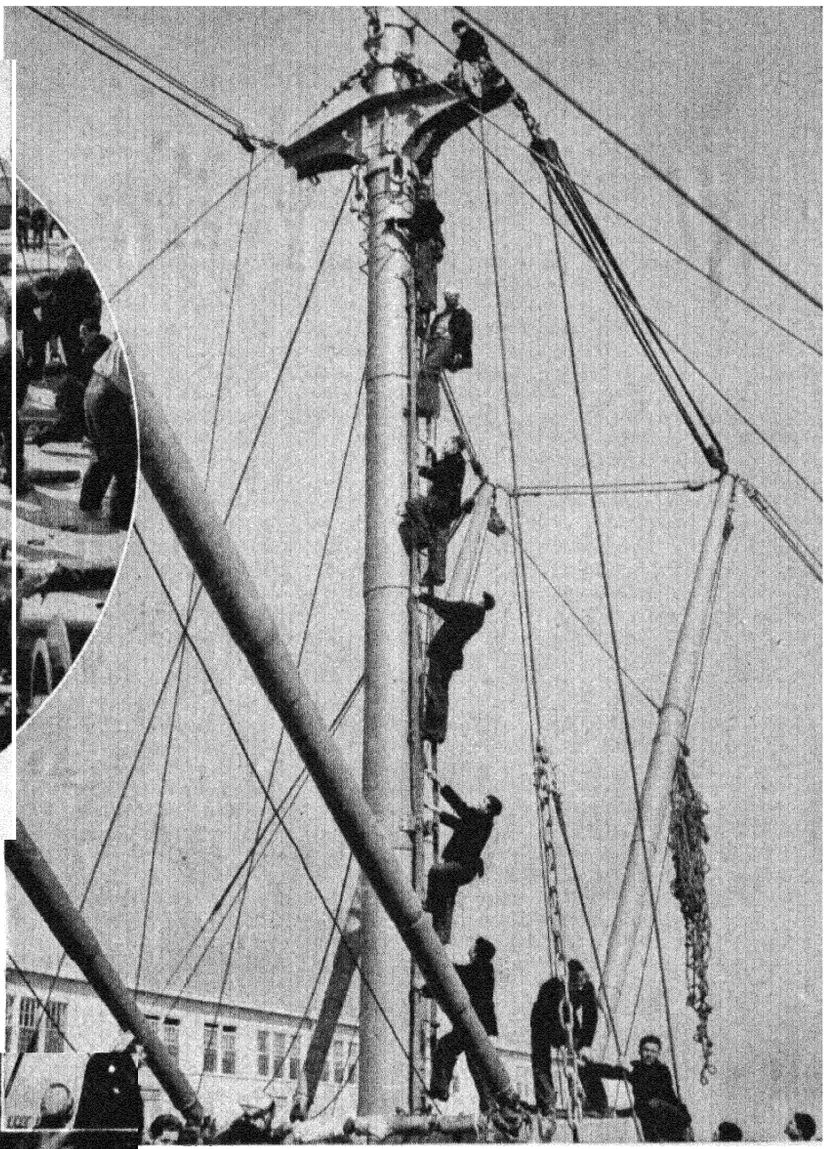
Early in the year the president directed that 8,000,000 dead-weight tons of shipping be built during 1942. This goal was exceeded with 8,089,732 dead-weight tons, consisting of 746 vessels delivered.

The output for 1943 was set at approximately 19,000,000 dead-weight tons. In mid-November the 24,000,000 dead-weight ton goal for the two years ending Dec. 31, 1943, had been met. By Dec. 1, 1943, 17,194,387 dead-weight tons, comprising 1,688 vessels, had been delivered to the maritime commission. This included 1,118 Liberty ships, 146 C-types, 215 tankers, 1 passenger-cargo vessel, 31 coastal-cargo vessels, 41 ocean-going tugs, 16 ore carriers, 97 special types and 23 barges.

Early in 1944 a part of the Liberty ship program was to be superseded by deliveries of another type of standardized cargo vessel, the Victory ship. It was faster and more efficient than the Liberty, making it much better for war service and a far better ship for peacetime trade competition.

Maintenance and repair of the vast merchant fleet was also an important phase of the over-all program. During the first six months of 1943 there were approximately 8,300 vessels of 1,000 gross tons or more repaired in the United States. This included keeping vessels in service, installing defense equipment and even returning to service ships that had been blown in half and sunk. As of June 30, 1943, more than 125,000 persons were employed in major ship repair yards around the coasts of the United States.

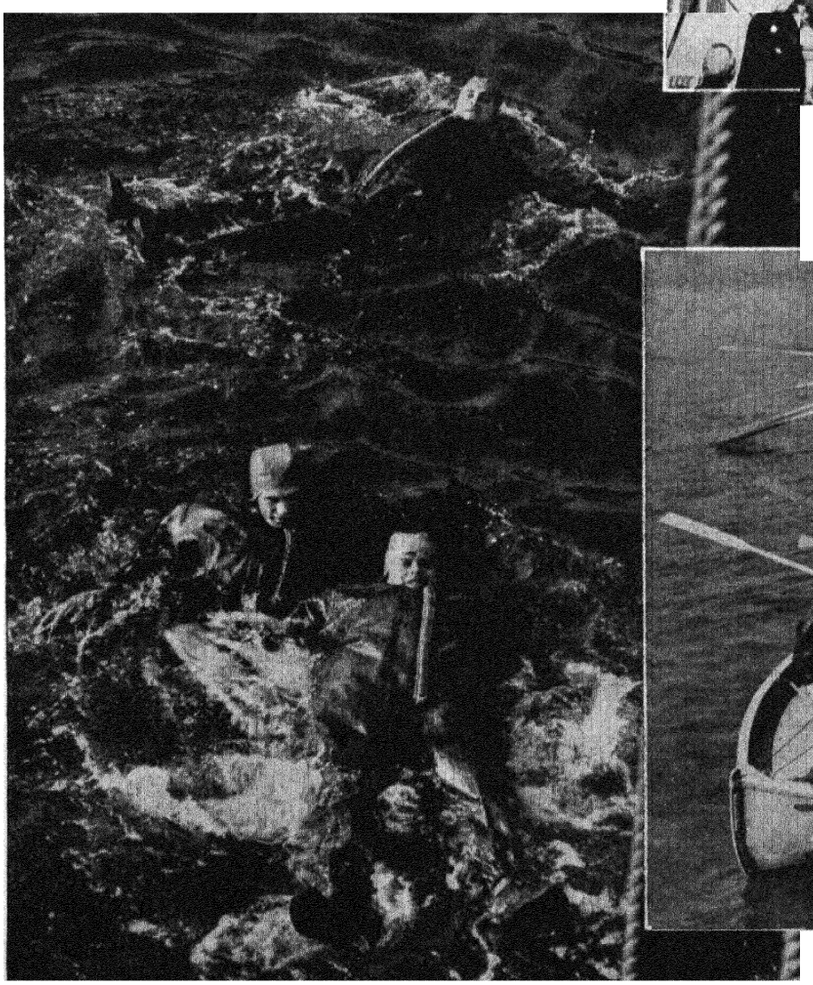
For every ship sliding down the ways an average complement of 42 merchant seamen was needed to carry on its operations. A systematic training program was organized following the Merchant Marine act of 1936. Its purpose was to formalize the training of marine officers and to maintain high standards of personnel and education.

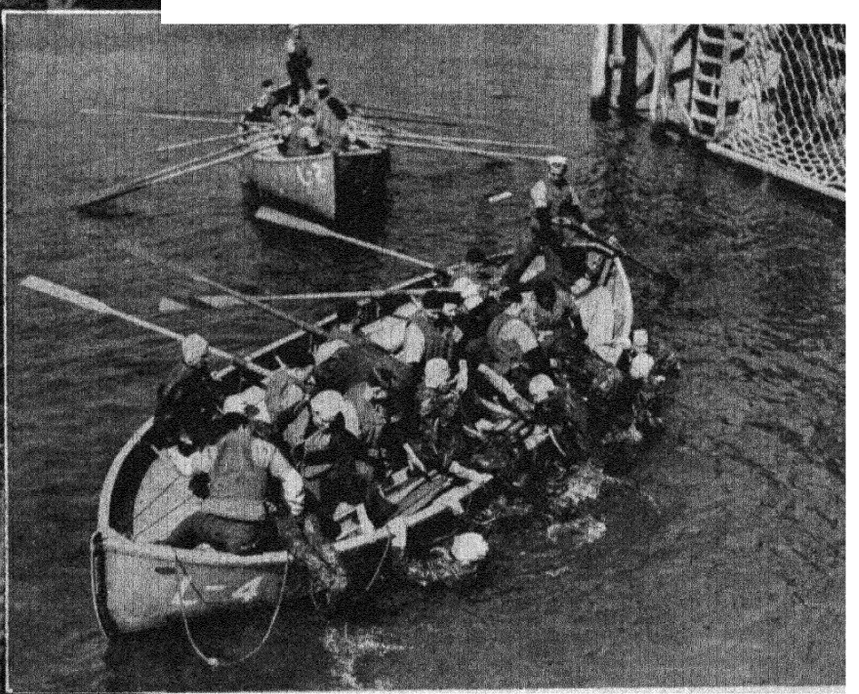


Since 1891 American vessels had carried youthful American citizens as cadets in training to become merchant marine officers. Other officers were supplied, at the rate of about 200 a year, from state nautical schools.

In March 1938 the commission set up the United States Merchant Marine Cadet corps for training officers. Four months later the United States Maritime service was established and administration was placed with the coast guard, under rules and regulations made by the maritime commission.

In forming a course of study in 1939 the commission abstracted the best features of systems which other governments had found useful. Ship operators desired an extension of the cadet training system with higher standards for enrollees and more adequate training. Also needed was a plan to permit li-





APPRENTICE SEAMEN at a maritime training station in 1943, aboard a "training ship" on concrete. After the U.S.A. entered World War II, the U.S. maritime service introduced a 13-week course that was soon turning out thousands of trained sailors each year

DECK HANDS at a U.S. maritime training station undergoing basic training

DRILL in the use of life suits is required for apprentice seamen of the U.S. maritime service until they can slip into the suits within 30 seconds

censed officers to equip themselves for advancement.

Training facilities were enlarged and the program accelerated along with ship construction. The training system in 1943 included the merchant marine cadet corps, maritime service and state academies. For the duration, operation of the merchant fleet was delegated to the War Shipping administration. This included recruitment and training of personnel to sail the ships.

Merchant Marine Cadet Corps.—Training in the cadet corps covered a period of 18 months for duration of the war, lowered from the peacetime term of three years plus a year as cadet officer. The course was divided into (a) three months' preliminary training at Cadet Basic schools at Pass Christian, Miss., San Mateo, Calif. or the United States Merchant Marine academy at Kings Point, N.Y.; (b) at least six months aboard merchant ships; and (c) nine months' advanced training in academic courses at the Merchant Marine academy.

Maritime Service.—Eight training stations for unlicensed maritime personnel and for licensed officer candidates were operated by the maritime service. Four of these gave a three to six months' course for apprentice seamen in the deck, engine and steward departments. They were at Hoffman Island, N.Y., Sheepshead Bay, N.Y., St. Petersburg, Fla. and Avalon, Calif. Officer candidate schools were maintained at Fort Trumbull, New London, Conn. and Alameda, Calif. They were open to seamen with a minimum of 14 months' sea experience who wished to qualify for a third-assistant rating. Also, a number of upgrading schools for licensed and unlicensed personnel were maintained by maritime service.

State Academies.—Five state academies, in Bronx, N.Y., Philadelphia, Pa., San Francisco, Calif., Hyannis, Mass. and Castine, Me., had some 1,200 cadets enrolled during 1943. Practically all of these men would become maritime officers before the end of 1944.

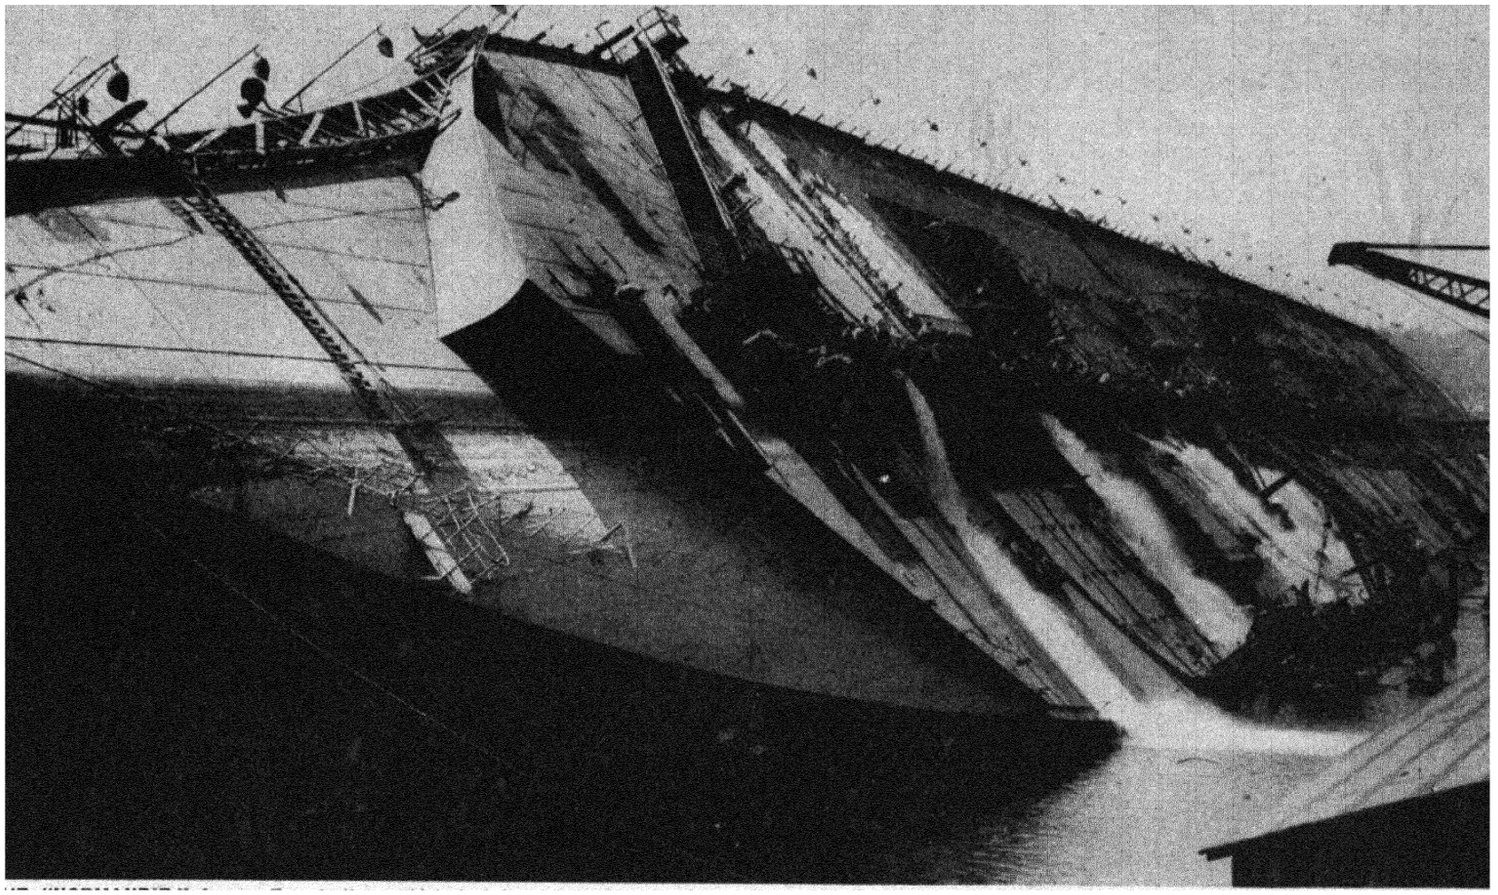
Combined training in these schools made available to the merchant marine from 1938 to Sept. 1, 1943, 9,169 officers, of which 1,157 were from the cadet corps, 6,767 from maritime service and 1,245 from state academies. Also, 1,261 radio operators and 36,568 unlicensed seamen in all ratings were trained for the merchant marine. This made a total of 46,998 men.

Besides delivering men and war materials to battle shores, the United States merchant marine helped to maintain the flow of lend-lease goods to the Allies. From the time of passage of the Lend-Lease act in March 1941 until July 31, 1943, lend-lease goods and services to other Allied countries totalled $13,973,339,000. As of June 1943 about 30% of the dry cargo space was given to these shipments. (*See* also SHIPBUILDING; WAR SHIPPING ADMINISTRATION.) (E. S. L.)

Great Britain.—Although there was no reason for complacency, the shipping situation during 1943 was considerably easier and the improvement was progressive. This was partly due to reduced sinkings by the enemy, partly to increased deliveries by the shipyards and partly to improved organization. On the financial side the reduced sinkings and the large number of submarines destroyed meant great relief in the expense of war risk insurance. All rates were greatly reduced, on some routes by as much as 75% and on a great many by between 50% and 60%.

The improved use and routing of ships by the Allied authorities was also striking. Far less time was lost through official orders and although there was still an uneconomical number of ballast voyages on the North Atlantic westward, greater use was made of returning army and navy supply ships for commercial cargo. Reciprocal arrangements to feed and supply Allied forces, for instance, the American forces, in the Pacific from Australia also led to a great saving in merchant tonnage.

The amount of tonnage used for feeding the British Isles was reduced by intensive farming, but the sinking of specially designed refrigerated ships, and their diversion to other purposes, was only partially overcome by dehydration and the transport of bacon and certain meats in slow tramp-type ships with a small refrigerating plant and insulation confined to the blanket system on the sides and bulkheads of the lower holds only. If the temperature of these holds is lowered as much as possible during loading, a small refrigerating machine is sufficient to keep 50,000 cu.ft. of bacon good for 20 days.



During the year the supply services to the forces in North Africa, Sicily, Italy and Russia made conspicuously big demands on commercial tonnage, but the slow, tramp-type ships proved most useful and the losses in convoy were far less than might have been expected. The re-opening of the Mediterranean route, which immediately followed the axis defeat in North Africa and was made more secure by the collapse of Italy, was admitted by German official sources to be worth 2,000,000 tons of shipping to the Allies. The supply of munitions to Russia went on without intermission, although every White sea convoy expected to be attacked and in some cases the losses were considerable. As the year progressed a growing proportion of these munitions went through the Persian gulf for use on the southern and central fronts, while Russian ships carried large quantities from the United States to Vladivostok without molestation by the Japanese, although it was perfectly well known that they were for use against Japan's ally, Germany.

Co-operation between the Allies made most of the manning and other resources available. In the summer it was announced that between 150 and 200 American ships, their type varying with the needs of the moment, were being "bare-boat" chartered to Britain during 1943, and British crews were sent out for them. Both Britain and the United States continued to reinforce the smaller Allied fleets in order that their seamen might sail under their own flags. Norway received 20 American ships, for the duration of the war only, as well as some from Britain, while France, Belgium, Holland and Greece were similarly supplied, the type of ship varying with her war purposes and the crew which was to handle her. China also received tonnage and immediately put it to good use.

All the British dominions increased their merchant fleets by new construction or other means. The Canadian was the most conspicuous and the government announced its hope that the service would be permanent. They experienced considerable difficulty in manning the numerous ships built. As far as the ratings were concerned, the supply was excellent through well-managed training establishments, but the question of the officers was more difficult. A number were borrowed from the British reserve pool and in the meantime a number of ships were "bare-boated" to the United States and Britain. Australia used many of her ships for the coastal sea transport of raw materials, while South Africa maintained a number of ships, including prizes from the enemy, transporting supplies for her war factories.

Considering all things, the Allies' manning difficulties were remarkably few, mainly on account of excellent planning and the magnificent spirit of the great majority of the men. The supply of recruits was almost unlimited except from the occupied countries, where they had no chance of getting away. Very few volunteers were accepted without some form of pretraining, for which there was ample opportunity both in Britain and in the dominions. The efficiency of men already at sea was also improved by various training establishments; the firemen's schools had excellent results in reduction of the smoke which had given away the position of so many convoys and in the saving of fuel.

The most troublesome feature of the manning side was the shortage of marine engineers, especially those with the higher

THE "NORMANDIE," former French liner which had burned at her pier in the Hudson river and keeled over in Feb. 1942, was refloated 18 months later. The ship was divided into watertight compartments, from which water was removed by controlled pumping. Pumping began early in Aug. 1943, and by Aug. 9 the bow had been raised 41 ft. out of the water (above). It was turned over to the navy on even keel Oct. 27

certificates of competency. This shortage undoubtedly increased in spite of the numerous certificated men who returned to the sea from positions ashore. One reason for this was the difficulty of studying for technical certificates under the strain of war service, the same strain which accelerated the natural wastage of the older men, while the casualties among engineers were higher than among deck officers. Secondary matters of concern were the increase in tuberculosis among seamen, the normal difficulties of efficient ventilation at sea having been greatly increased by the necessity of blackout precautions, and a tendency for Asiatic seamen—Indian, Malay and Chinese—to cause trouble. That is recognized as being very largely due to the long periods away from home on war service.

There was a very gratifying increase in the proportion of torpedoed seamen who were saved: well over 80%. This was partly due to improvements in the build and equipment of lifeboats and life rafts, although it was realized that there was a danger of introducing so many useful fittings that there would be little room for the men. The officers' and seamen's organizations acted in close co-operation with the shipowners in putting life-saving suggestions before the government, and many were approved after test. Remarkable progress was made in the evolution of really practical distilling apparatus suitable for fitting into lifeboats, where thirst caused more terrible deaths than anything else. The authorities carefully tested numerous types; most of them proved unsuitable, either because they were too complicated or because they and their fuel weighed too much, but some gave remarkable results.

The number of lifeboats burned through oil or petrol from torpedoed tankers catching fire on the surface of the water led to the order that tankers should be fitted with steel lifeboats, in spite of certain disadvantages and the difficulties of supply. To overcome these, experiments were made with considerable success to evolve a fire-resisting wooden lifeboat. The design of life rafts was also greatly improved.

The merchant services of the Allies continued to work independently but in close co-operation with Britain and the United States. Generally speaking, their material decreased, for the allocations made did not completely cover the losses; but the morale of their crews kept up wonderfully and the successes in North Africa, with the strengthening of French feeling after the complete occupation of the country, greatly increased the number of French ships at the Allies' disposal. The men generally strongly preferred to serve in the Fighting French navy rather than in merchant ships.

Neutral Shipping.—As in World War I, Germany divided the neutrals into those who mattered and those who did not, but none was immune from attack and many ships were sunk on purely neutral voyages. During the year 1943 this applied even to Spain, whose sympathies were reckoned as being with the axis and whose ships had frequently been accused of unneutral service. These casualties greatly increased the supply problems of the country. The Swiss government acquired as many ships as possible, mostly at an exorbitant price, but had great difficulty with their polyglot crews. In South America the shortage of tonnage was felt most keenly in the Argentine, where great quantities of grain were used as fuel in lieu of imported coal. The Turkish fleet, which had been depleted by a number of small vessels sunk by the axis in the Black sea, was strengthened by several cargo ships transferred from Britain and by the acquisition of the crack Rumanian government liners "Bessarabia" and "Transylvania" which had been sheltering in Istanbul for a long period in spite of German efforts to get them transferred to the trooping service.

The Swedish merchant marine started the year with about 40% of its prewar tonnage lost by war risk and the great majority of its new ships laid up. Even before relations between Sweden and Germany became strained, and while the Germans

were obtaining great benefit from Swedish concessions, the German press was complaining bitterly that Sweden was utterly selfish in building motorships for postwar work, which had to be laid up for lack of oil, instead of coal-burning steamers, which could be used on the German supply services. All through the year Swedish seamen of all grades, in spite of the generous bonus which they drew, showed a growing dislike for these services, which culminated in the summer in many of them refusing to sail to the North sea ports. They maintained that the Germans always gave them the most dangerous jobs and put them in the worst positions in the convoys, in order to preserve their own ships.

Early in the year Sweden was greatly handicapped by the sudden German withdrawal of her safe conduct to "permit ships," which had been allowed to pass through both belligerent blockades for the revictualling of Sweden from South America. The Germans maintained that any of these ships which were lost —their number was considerable—should be replaced from those in Allied hands and not from the ships in Swedish waters, but the Allies naturally did not agree. Considerable hardship was caused to Sweden until Berlin abandoned the attitude and the safe conducts were renewed.

Axis Shipping.—All the enemy powers suffered acutely from a shortage of shipping through attacks of Allied submarines, speedboats and aircraft, and the difficulty of maintaining the remaining ships in an efficient and seaworthy condition. In Germany there also appeared to be considerable disaffection among the crews, although such reports had to be accepted with reserve. There was no doubt that the Italian merchant seamen were strongly objecting to the Mediterranean supply services before the fall of Tunisia, and Germany had to send crews for the great majority of the French steamers which were seized when the south of France was occupied. Most of the remainder were manned by the Italian navy. The Japanese government was also forced to admit the acute shortage of shipping in the Pacific, in spite of every effort, and used this as an excuse to the disappointed public for the small quantity of loot from the occupied territories which had reached Japan.

British shipping finance was very worrying to the owners and of little interest to investors. With general requisitioning, each ship lost automatically reduced the receipts of the company and it was fully realized that with shipbuilding costs steadily rising, the money received from war risk insurance was less than ever adequate to replace casualties. In Germany, Italy and Spain government control made published accounts meaningless and in Sweden most profits were put aside for postwar development.

Shoe Industry.

The world-wide shortage of shoes in 1943 was estimated at 1,000,000,000 pairs due to war wear, waste, plant destruction and global economic pressures. Leather, the seventh essential material for warfare, was in acute shortage the world over for it was used in more than 400 items directly and indirectly associated with the war effort. Civilian restraint, by rationing, by regulation and by enforced denial reduced production in all lands below the point of physical needs.

The most serious shortage was in children's shoes, complicated by growth as well as wear, to the point of real menace to health. Priorities for production were expected to correct, in part, this serious situation in 1944—in England and the United States and countries not directly under fire.

Comparative Statistics of U.S. Shoemaking, 1941, 1942 and 1943

Production of Shoes by Major Types

*Includes rationed and non-rationed types.
†Estimated.
‡Excludes shoes for military purposes.

In 1943 a Joint Leather commission, consisting of British, Canadian and U.S. experts, surveyed hide and skin resources in the Argentine, Uruguay and Brazil and collected world statistics on availability of raw stock supply. The Combined Raw Materials board, after receiving the report of the Footwear, Leather and Hides mission sent to England, established a flexible formula for the allocation of world leather on agreed ratio of civilian and military needs.

The percentage of foreign hides necessary to allocate to the countries on such a formula was dependent upon the estimated supply position, for the period in question, of the respective domestic markets and the exportable surplus from all other markets. For example, assuming that the following would be the number of hides available in any one year: United States domestic hides—20,000,000; United Kingdom domestic hides—2,000,000; foreign hides—10,000,000; total—32,000,000. Under a 3.5 to 1 ratio the United States would be entitled to about 25,000,000 hides, of which 5,000,000 would be imported, *i.e.*, 50% of the foreign hides.

International co-operation was expected to survive the cessation of hostilities for some indeterminate period of time because the leather shortage would continue until store and consumer stocks were replenished.

United States production of leather shoes decreased at an alarming rate in the closing months of 1943 due to reduction of manpower from 200,000 prewar to 177,000 workers in October. In the ten-month period of January to October, men's work shoes showed a percentage decline of 15% and men's dress shoes 20%; youths' and boys' increased 13.5%, misses' and children's shoes dropped 22% and infants' decreased 2%. Output of women's shoes was 12% less; part-leather and part-fabric shoes decreased 27% and all-fabric, non-rationed shoes showed an increase of 437% during this period.

Rationing of shoes in the United States, at the rate of one pair per person per period, started Feb. 9, 1943; second coupon June 15 and third coupon Nov. 1, 1943 to be valid indefinitely, was calculated to restrain consumer shoe buying. But the non-rationed field of shoemaking became an avenue of escape for manufacturers, merchants and public and showed an increase of 437% production, which would indicate that shoes made of ma-

terials other than leather could be marketed and worn as extra foot coverings despite their short wear-hour utility.

Rubber footwear was limited to stern necessity—requisitions being demanded for rubber boots and heavy work types. Civilian rain gear was in minimum supply and no tennis or gymnasium type shoes were manufactured for civilian sale. Some relief in children's rubber type footwear was expected in 1944. (*See* also LEATHER.) (A. D. AN.)

Shows. **Dogs.**—There was an increased demand in the United States in 1943 for pet and companion dogs. Breeding specimens were in demand, the top sale being that of a boxer for $7,500.

The highlight of the year was the extensive training of dogs as part of the armed forces, at five training camps. Approximately 1,500 dogs were sent out monthly from these camps for service on various battlefields throughout the world.

Dog shows suffered a decline of about 20% in number. The leading show was the New York city event in February—the Westminster Kennel club, with 2,351 dogs entered.

In field trials, the pointer Ariel captured the chief "bird dog" honour, placing first at the Grand Junction, Tenn., field trial. In retrievers, the same black labrador that won the championship in 1942, repeated—Shed of Arden. Registrations saw the merry little cocker still in top place on American Kennel club records with beagle, boston, scottie and wire following in order. The *American Field,* registering mostly "bird dogs," listed approximately 12,000 for the year, pointers leading. (W. JU.)

Horses.—All kinds of horse shows continued to be sharply restricted in 1943 due to several causes: limitations on public meetings; the use of buildings and grounds by the military for defense purposes; the absence of horse owners on war duties; and restrictions on shipment of horses by rail or truck. Race meets were an exception, most races being held as usual with large attendance. Most of the great state fairs were omitted or held on a very small scale because their grounds and buildings were being used by the government. New York and Ohio held no fairs, Wisconsin, Illinois, Indiana and Iowa held only small exhibitions without animals.

The International Livestock Exposition and Horse show at Chicago and the American Royal Livestock and Horse show at Kansas City were cancelled. The National Horse show at New York was reduced to a small exhibition of juniors conducted for war-activities benefit purposes. Some of the hunt clubs and riding societies held small meets for local benefits. Those in the vicinity of New York, Philadelphia and in Kentucky attracted considerable crowds. The absence of many leading horsemen in the services and on special war work left the exhibitions largely in the hands of the juniors. The declining place of the horse in modern warfare was mentioned as a factor in some circles. Notwithstanding the limitations on motoring, the light horse did not gain greatly in popularity. (J. C. MS.)

Livestock.—War exerted even more restrictions on the normal schedule of fairs and expositions, and their attendant livestock shows, in 1943 than in the preceding year. One of the few exceptions was Denver's National Western Stock show which annually opens the calendar year of American livestock shows in January. This exposition took place Jan. 16 to 23. It was one of the largest and most successful Denver shows ever held.

This show is famous for its large competitions featuring range-bred feeder cattle and purebred bulls of the beef breeds. It is an important source of supply for bulls required for range service as well as for quality beef calves that move, under normal conditions, from this event into corn belt feed lots each year.

The oldest livestock show in the United States is the Southwestern Exposition and Fat Stock show, held annually in Ft. Worth, Texas, in March. In 1943 this showing was reduced to an exhibition of market animals only, stock that was moved to slaughter direct from the show.

With the exception of Denver, all of the national and sectional livestock expositions were confined to market animal shows only in 1943, in most instances because of a loss of show facilities.

These, in addition to Ft. Worth, were the Pacific International Livestock exposition in Portland; the American Royal Livestock show in Kansas City; and the Aksarben Livestock and Horse show in Omaha, all of which were confined to exhibitions of market stock.

Since it was founded in 1900, the largest livestock exposition in the United States, and the world, has been the International Livestock exposition, held annually, up to the war, during the first week of December at the Chicago stockyards. The international show was cancelled both in 1942 and 1943. The International amphitheatre, one of the country's most modern exhibition buildings, built as a permanent home for the exposition, was taken over by the army shortly after the outbreak of war.

In place of the International Livestock exposition, an exhibition of fat stock only was held during the same week the full exposition would have taken place. Known as the Chicago Market Fat Stock and Carlot competition, this show was held in sheds and pens of the Chicago market. Even thus restricted, a total entry of 4,558 head of steers, lambs and hogs was shown here in 1943 by stockmen from 14 states and Canada, comprising the largest livestock showing of the year. This show was held from Nov. 29 to Dec. 2.

Canada's two largest annual livestock shows, the Royal Winter fair and the Canadian National exhibition, both held in Toronto, were cancelled in 1943, as in 1942, because of the war. The largest Canadian show held in 1943 was the Calgary Exhibition and Stampede at Calgary, Alberta, July 5 to 10.

The purebred dairy cattle industry was even more restricted than was the beef cattle industry through the cancellation in 1943 of both the National Dairy show and the National Dairy Cattle congress, the two national shows that normally reflect progress in the dairy industry on a nation-wide basis. The National Dairy show is an itinerant exhibition and the National Dairy Cattle congress had been held each year in Waterloo, Iowa.

In 1943 all but five state fairs were cancelled. Two fairs, the Indiana and South Dakota state fairs were reduced to 4-H club exhibits. Of the series of midwest fairs, normally the country's largest, only one, the Wisconsin state fair, was held. This show took place in Milwaukee, Aug. 21 to 27. The other states holding fairs in 1943 were Kansas, Missouri, Nebraska and Oklahoma.

The only show of importance in Great Britain that survived the war was the annual Perth Show and Sale in Scotland, featuring Shorthorn and Aberdeen-Angus cattle, the two major breeds in Scotland. The 1943 show and sale was held in February. A six-day show, three days each were apportioned to the judging and sale of these two breeds.

The oldest livestock show in the world is the Highland Agricultural show of Scotland. After 108 years of continuous progress, it had not taken place since 1939; and the Royal Agricultural show of England was discontinued the same year, after 98 continuous years, because of the war.

South America's leading agricultural show, the Palermo, was again held in Buenos Aires in Aug. 1943. In 1943 the Palermo show was termed an international exhibition, as it is every fifth year. It occasionally draws entries from Great Britain and other South American countries on these fifth year renewals but owing to war conditions, exhibits in 1943 were confined to those from

Argentina and Uruguay. The Palermo is the world's largest showing of Shorthorn cattle and is also noted as an exhibition of Aberdeen-Angus and Hereford cattle, as well as sheep. Lesser emphasis is placed on the exhibits of Holstein-Friesians and Guernseys, the principal dairy breeds of the Argentine. (W. E. O.)

Sikorski, Wladyslaw (1881–1943), Polish politician and army officer, was born May 20 in Tyszowce, Narodovy, Austrian Galicia, and studied engineering at the Lwów University Technical college, graduating in 1908. One of the leaders of the prewar nationalist movement in Poland, he was trained in the Austrian army, 1905–06, commanded a regiment of the Polish legions in World War I and fought in the Polish-Russian conflict, 1920. After the assassination of Polish President Narutowicz, Gen. Sikorski, then chief of the general staff, was made premier and interior minister, 1922–23. He served as war minister, 1924–25, then returned to army service as commander of the Lwów military area. His dismissal from the army in 1928 was only one of the many personal changes effected by Marshal Pilsudski in the civil and army administrations after he took power. Sikorski subsequently went to France where he wrote extensively on political and military matters.

At the outbreak of the war with Germany in Sept. 1939, his request for an assignment to active service was refused. After the collapse of Poland, however, he became premier of the Polish government-in-exile; in addition, he was made commander in chief of the Polish legions that fought on battlegrounds in France, Britain and the middle east. Politically, he mended his fences with the Czechoslovak government-in-exile, but ran into a snag on the thorny issue of relations with Russia. On June 23, 1941, Gen. Sikorski secured an agreement with Moscow which invalidated the Soviet-German pact partitioning Poland in 1939. But dissatisfied with the conduct of anti-Russian elements within the Sikorski cabinet, the Russians ruptured diplomatic relations in April 1943. Sikorski's continued efforts to mend relations with the soviet union were interrupted by his death in a plane crash, July 4, while en route from Gibraltar to London.

Silk. China, in 1943, began to lay plans for postwar development of its silk market, which the Chinese anticipated would replace the Japanese market as the chief source of supply for United States and European manufacturers. After the convention of United Nations representatives on food distribution, held in the United States in May and June, Chinese delegates conferred in Washington with government officials and former silk industry executives as to what the silk market might be after the war and how China could capture it. Also present were representatives of producers of synthetic fibres, for China did not ignore the fact that the return of silk to textile products was made questionable by the inroads of synthetic fibres during the war period. This was especially true of nylon in the manufacture of women's hosiery. It was the opinion of American silk people present that the silk demand after the war would be limited to a few special fabrics, such as neckwear for men, better dress fabrics, etc., but that the hosiery market would be almost completely taken over by the synthetic fibres. To what degree the Chinese could supply even the small potential demand depended upon the condition of their mulberry groves and filatures (reeling factories) after the defeat of the Japanese (since the major silk sections were in enemy hands) and upon the ability of the Chinese to adapt their reeling methods so as to reel silk of the size and standards of quality needed for American-type machinery. The Chinese had customarily reeled very fine silk that could be used on the slower weaving and knitting machinery of European mills but was not efficient for high-speed American machinery operated by high-wage workers.

Statistical data about silk in 1943 was nil except for scattered reports from less important centres of production. In China, determined efforts were being made in Sinkiang to preserve silk raising by importation of mulberry saplings from the soviet union and 551 lb. of eggs from interior China. The 1943 yearly production was estimated at 347 short tons. In Yunnan province, 8,144,000 new mulberry trees were planted in the first six months of 1942 but results of that planting were not of use in 1943. However, approximately 59 piculs (1 picul equals 133⅓ lb.) of low-grade and 150 piculs of high-grade silk were produced by one of the larger operators in that area. The total investment of the sericultural industry of Yunnan province was estimated, in 1943, at $25,000,000 (national currency). In India, where the raising of silk for weaving into parachute cloth for the United Nations was started in 1941 and 1942, a new three-year program was started in 1943 for enlarging of mulberry groves at an expense of 1,250,000 rupees annually. A conditioning house was established at Kashmir, the centre of the silk industry in India, and it was said that 4,000 families in the Kashmir area derived their entire livelihood from the raising of silk. In addition, it provided a part-time industry for 50,000 more families. Indian industrialists also made inquiries in the United States for the names of the best engineering firms in the textile industry with the idea of modernizing weaving equipment in order to enter the postwar fabric markets in a substantial way.

In the near east, a silk-reeling plant was installed at Cyprus during 1943 to take over the reeling of a part of the cocoon crop of that island although it was said that the greater part of the expanding production would continue to go to Syria and Lebanon, where the weaving of silk fabrics was well established, for local consumption. Bulgaria was reported to have started a special two-year sericultural course during 1943 to encourage more modern methods of silkworm raising and cocoon reeling.

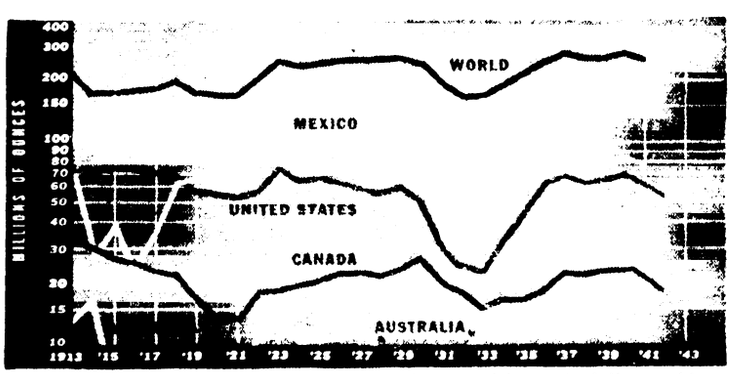
Even in the Belgian Congo, a silkworm gut industry, begun just prior to the war, reported in 1943 a production of 2,200,000 strands compared with 80,000 strands in 1940. Silkworm gut is a valuable commodity for use in surgical sutures.

In the western hemisphere, the several projects started in 1941 and 1942 to raise silk met with varying degrees of success in 1943. No further reports came from Venezuela although prospective American buyers of that country's cocoons for manufacture into spun silk stated that the price was entirely out of line with market prices on manufactured yarn. Brazilian efforts were moving slowly but in Dec. 1943, a New York department store had enough manufactured Brazilian silk fabrics to put them on display at a price of about $6.75 a yard. The same fabrics, according to reports from Rio de Janeiro in October, sold at $2.00 a yard there. Five weaving plants were making the all-silk fabric and the government was encouraging the production of silk by furnishing free mulberry plants to farmers in São Paulo and Minas Gerais.

In the United States, the War Production board conducted a country-wide campaign in 1943 to collect used silk stockings for manufacture into yarn for cartridge-bag cloth, utilized in holding the powder charges for big guns. This yarn was formerly made of pierced cocoons, but spinners discovered a process of using silk stockings for the same purpose. As a result, by Sept. 30, the salvage division of the War Production board announced a total of 49,000,000 pairs or 2,965,000 lb. of silk and nylon stockings had been received. The supply of silk hosiery was ample, it was understood, to cover powder-bag cloth requirements over the

next three years. (*See* also RAYON AND OTHER SYNTHETIC FIBRES; TEXTILE INDUSTRY.) (I. L. BL.)

Silver. Returns on world silver production were so few that it is impossible to make any estimate of the 1942 world total; such figures as were received will be included in the text discussion, without making any addition to the following table.



World Production of Silver
(In millions of fine ounces)

	1937	1938	1939	1940	1941
Canada	23.0	22.2	23 2	23.8	21.8
United States	71.3	61.7	63 9	68.3	65.8
Mexico	84.7	81.0	75.9	82.6	78.4
Other N. America	4 8	5.0	6.0	6.0	6.1
Peru	17.5	20.6	18.8	19.9	17.5
Bolivia	9.5	6.4	7.2	5.6	7.4
Other S. America	4.2	4.3	4.7	5.3	5.0
Germany	6.8	7.0	7.0		
U.S.S.R.	7 2	8.0	7.0	22.0	?
Other Europe	7.2	8.5	9.2		
Japan	12.6	13.0	14?	13?	?
Burma	6.2	5.9	6.2	7.0	?
Other Asia	1.9	2.4	1.7	3.4	?
Africa	5.2	5.7	4.7	4 6	?
Oceania	14.8	15.1	15.5	15.6	?
Total	277.7	267.7	265.1	277.0	265?

Following the ruling of the War Production board in Oct 1942, closing all gold and silver mines not having material outputs of essential base metals, the output for the year showed a decline from 72,336,029 oz. in 1941 to 56,090,855 oz. in 1942. Figures for 1943 were correspondingly low, with a total of 36,262,000 oz. through October, against 47,521,000 oz. in the same period of 1942. At this rate the total for the full year should be about 43,514,000.

The passage of the Greene act during 1943 made about 1,000,000,000 oz. of U.S. treasury stocks of silver available for certain specified essential war uses. The so-called "free silver" in the treasury, that is, metal not held as backing for silver certificates issued, was available for war uses shortly after Dec. 1941, and was extensively used, but efforts to include monetized silver as well were blocked by the silver interests. The act finally passed seemed to be a move in the right direction, but apparently permitted uses were so restricted that the measure would have little real effectiveness; or at least one would judge this to be the case from the fact that to the end of the year purchase permits had been issued for only about 25,000,000 oz., of which about 3.000.000 oz. went to Great Britain under lend-lease. The need for greater freedom of use for treasury silver was also confirmed by the fact that since both domestic output and imports declined, there was no surplus of supply of either, beyond the current demand for permitted uses.

Silver production in Canada in 1942 suffered much less decline

SILVER PRODUCTION of the major producing countries and of the world, as compiled by *The Mineral Industry*

than in the United States, dropping to 12,138,000 oz. in the first eight months of 1943, as compared with 13,482,000 oz. in the same period of 1942 The total for 1942 was 19,752,000 oz.

Through Aug. 1943, silver output in Peru totalled 10,850,000 oz., or at an average rate of 16,325,000 oz. for the year, as compared with 16,600,000 oz. in 1942 (*See* also MINERAL AND METAL PRODUCTION AND PRICES.) (G. A. RO.)

Simeon II (1937–), king of Bulgaria, was born June 16. On Aug 28, 1943, his father, Boris III, died under mysterious circumstances—his death being reported variously as due to a heart attack, to poisoning and to shooting—and the six-year-old crown prince ascended the throne. In September a regency was named, consisting of King Boris' brother Cyril, former war minister Lieut Gen. Nikola Michov and former premier Bogdan Filov, who had resigned with his cabinet shortly before

Sinclair, Sir Archibald (1890–), British politician, was born Oct. 22 in London. Educated at Eton and Sandhurst, he joined the army in 1910, but later resigned to enter politics In 1922 he was elected to commons as a Liberal party member for Caithness and Sutherland. He was chief Liberal whip, 1930–31, and served as secretary of state for Scotland, 1931–32. After the party split over the issue of joining the Baldwin government, Sir Archibald became head of the Independent Liberals. Blunt and forthright, he thundered against Britain's hesitant stand on the Ethiopian issue and lashed Chamberlain's appeasement policy. When Churchill became premier in May 1940 he made Sir Archibald secretary of state for air. Early in 1942 he promised 1,000-plane raids over Germany, and he more than kept that promise. He told the commons in March 1943 that British air power had wrecked or damaged 2,000 nazi factories. In June Sir Archibald accompanied King George VI to the North African front.

Sinkiang (CHINESE TURKESTAN) Largest and most remote of the provinces of China, bounded N. and W. by the soviet union, N. by Mongolia, S. by India and Tibet, E. by China. The name means New Dominion. Area, 705,769 sq.mi.; pop. (estimate of Chinese ministry of interior, 1936) 4,360,020. Capital Urumchi (Tihwa) (50,000) in the northern part of the region The two other largest towns, Kashgar (80,000) and Yarkand (75,000) are in the south. Religions: Confucianism, Taoism, Mohammedanism Governor in 1943 (since 1933) General Sheng Shih-tsai. Chinese constitute about 10% of the population, and there are 14 other ethnic groups, mostly Turki tribes. Sinkiang is in large part an arid country and the small proportion of land under cultivation is mostly located in oases and river valleys. Among the principal export products are wool, cotton, furs, skins, sheep, cattle and horses. Machinery and manufactured goods are purchased in the soviet union. Some 2,440 mi. of motor roads were built in Sinkiang during the decade 1932–42, but there were no railways in 1943. The air route from Chungking to Moscow lies across Sinkiang, with stops at Hami, on the eastern frontier of the province, and at Urumchi.

Sinkiang experienced an interesting shift of power and influence during 1943. After 1934 Russian political and economic influence had been very strong, although at no time was Chinese sovereignty abrogated And in 1943 this sovereignty became more genuine than it had been for many years. As a result of secret negotiations, the details of which were not fully known, there was a large-scale Russian political, economic and military evacuation from Sinkiang. Russian soldiers withdrew from their station at Hami, Russian economic equipment was dismantled

and removed. Signs of the changing atmosphere were the widespread display of portraits of Chiang Kai-shek and Kuomintang slogans, the return of traffic to the left side of the road, as in China (it had been routed, Russian fashion, on the right side) and the opening of U.S. and British consulates in Urumchi, which had hitherto been regarded as an exclusive Russian sphere of influence. (W. H. CH.)

Skiing. All national ski championships of 1943 were called off because of the war, leaving the 1942 collection of champions in possession of the various titles and restricting the sport almost exclusively to the Atlantic coast.

If any unofficial title recognition was in order for 1943, the honours belonged to Arthur Devlin. The 20-year-old Syracuse university freshman dominated the eastern, jumping until the time he became an army air cadet midway in the season. Devlin's performances, which included second place in the 1942 national championship, brought him recognition as the United States' outstanding native-born ski-jumper. He started the 1943 season by winning the downhill and 40-metre jumping events of Lake Placid's 22nd annual collegiate meet. He set a meet record of 136 ft. on the 40-metre hill—called the Olympic jump. He also defeated Sergeant-Pilot Ola Aangesen, the 1942 national champion, with a jump of 206 ft. in an exhibition at Lake Placid's long hill. Just before going into the armed service, Devlin won the President Roosevelt trophy at Bear Mountain, N.Y., with a jump of 153 ft. The Roosevelt trophy meet revealed poignantly the influence of the war and gas rationing upon ski-meet attendance.

In 1942 a crowd of 19,500 attended the Bear Mountain classic; in 1943 the crowd numbered 1,500.

The University of New Hampshire won the 34th Dartmouth Outing club carnival, combined with the Senior Intercollegiate Ski union championships. New Hampshire scored 567.5 points to 562.5 for the host school. The defeat for Dartmouth in the Intercollegiate union championships was its first since 1935. Individually, Bill Distin of Dartmouth was the meet's standout with victories in the downhill and cross-country and seconds in the slalom and jump.

Skiing's main tragedy of 1943 came late in the season when John Neal, 17-year-old Lake Placid skier, died of injuries received in a fall. Neal won the Washington birthday jump at Lake Placid.

Weather and transportation problems forced cancellation of almost all competitive skiing in other sectors of the country. Late in 1943 the Norge Ski club of Chicago made plans for a mild revival of midwest ski jumping by scheduling an exhibition tournament at Wrigley field, home of the Chicago Cubs of the National Baseball league. (M. P. W.)

Slate. The production of dimension slate in the United States showed a marked decrease in 1942, dropping 41% to 107,030 short tons, while ground material increased 11% to 483,740 tons, a total of 590,770 tons, valued at $6,360,223. The heaviest drops were in roofing slate (49%) and billiard table tops (31%), while electrical slate and ground slate each increased 10%. (G. A. RO.)

Slemp, Campbell Bascom (1870–1943), U.S. politician, was born Sept. 4 in Turkey Cove, Va. He was graduated from the Virginia Military institute, 1891, and studied law at the University of Virginia. After a period of teaching mathematics and practising law, he entered the business world and was president of the Slemp Coal company and other large corporations. He made his debut in politics in 1905, when he was named chairman of the Virginia Republican State Committee of Virginia, and rapidly became a G.O.P. power in the south. In 1907 he was elected to the United States house of representatives to fill the unexpired term of his father, who had died, and was re-elected during a 14-year period running from 1909 to 1923. During the 1920 presidential campaign, Slemp was leader of the Harding drive to crack the Democrats of the solid south. From 1923 to 1925, he was secretary to President Coolidge, acting as the president's conciliator before congress, and helped him win the Republican nomination in 1924. In 1928 Slemp supported Hoover, but the setting of the Republican sun during the depression years led Slemp to resign as chairman of the party's committee in Virginia and he never regained the limelight as a political figure. He died of a heart ailment in Knoxville, Tenn., Aug. 7.

Slovakia. A nominally independent republic in Central Europe, a part of Czechoslovakia until its secession, with German help, in March 1939, after which it placed itself under German protection. Area 14,848 sq.mi.; pop. 2,800,000, of whom the great majority are Slovaks, a Slav people closely akin racially and linguistically to the Czechs. The majority are Roman Catholics, but there is a considerable Protestant minority. Capital, Bratislava (132,852); chief cities: Trnava (24,000); Nitra (21,250). President (1943): Msgr. Joseph Tiso; premier, Dr. Bela Tuka.

History.—In 1943 the clerical fascist regime in Slovakia continued in closest collaboration with Germany, shaping its policy entirely after the nazi model. But many Slovaks protested against the anti-democratic and anti-Czech policy of the Slovak government and worked actively for the re-establishment of the Czechoslovak republic.

Leading Slovaks participated in the Czechoslovak government established in England under Dr. Eduard Beneš.

The clerical fascist regime in Slovakia perfected during 1943 its anti-Semitic legislation according to the nazi model. Minister of the interior Sano Mach declared in a speech on Feb. 8 that all Jews would be deported to eastern Poland. At that time it was estimated that only 20,000 of the original 90,000 Jews were still left in Slovakia.

The Slovak Protestants under Dr. Samuel Osusky, bishop of the Slovak Evangelical church, petitioned the government on April 17 to recall the Slovak division from the Russian front. It was later reported that large parts of the Slovak troops had been recalled or had joined the Russians. (*See* also BOHEMIA AND MORAVIA; CZECHOSLOVAKIA.) (H. KO.)

Smith College. An institution of higher education for women at Northampton, Mass. In 1943–44 the college continued emphasis on the humanities, history, art and languages, with interest in science and mathematics increasing. Beginning in 1943, students were offered a choice of graduation in four years or in three years if they chose to attend two summer sessions. During the summer vacation of 1943 the majority not thus accelerating their studies assisted the war by work on farms or in industry. Extracurricular activity in first aid, home nursing, nutrition, etc., continued. WAVES continued their training program on the campus. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.
(H. F. D.)

Smithsonian Institution. The institution was founded in 1846 through the bequest of James Smithson, an English scientist, "for the increase and diffusion of knowledge among men." The governing body is the board of regents, comprising the chief justice, the vice-president, three senators, three representatives, and six eminent private citizens; the executive officer, the secretary, Dr. Charles Greeley Abbot. The institution administers six government bureaus that grew directly out of its early activities, and also the Freer Gallery of Art; the National Gallery of Art is a bureau of the institution but is administered by a separate board of trustees.

With the United States at war, the institution devoted itself mainly to aiding with its specialized knowledge the army, navy and other war agencies. Technical information in the fields of geography, anthropology, biology, geology and engineering, and laboratory investigations of special problems were involved. Exceedingly effective, and greatly in demand by the army, the navy, the universities and the public, was the new series of pamphlets entitled "War Background Studies." Most of these authoritative papers deal with the geography, peoples and resources of the regions penetrated by the war. Others treat of the evolution of nations, the natural-history background of camouflage, and the poisonous reptiles of the world. Sixteen of these publications were printed, and the total distribution covering the year 1943 exceeded 150,000.

In co-operation with three other scientific agencies, and with moderate financial support from foundations, the institution took part in establishing the Ethnogeographic board, a nongovernmental agency set up to act as a clearinghouse for technical information within its scope requested by the army, navy and war agencies. The institution gave office space and compensation of the director, and also assigned to it the service of three members of the institution's permanent staff. This board was in position to obtain spot information in widely divergent fields to meet the constant and urgent calls of the armed services. Thousands of such inquiries were quickly and satisfactorily answered by immediate reference to the host of well-informed experts with whom the board had contacts. It also furnished at the request of the army and navy extended reports by experts on strategic areas.

As the repository of nearly 18,000,000 specimens of national value, present and for the future, the institution, of course, continued their care and the care of the buildings. To guard against loss by air raids, a selection of the most valuable irreplaceable specimens was removed to a distant repository where they are under guard.

The Astrophysical observatory maintains its three solar observing stations on distant desert mountains, to keep unbroken its unique record of the variation of the radiation emitted by the sun, on which all life and weather depends. Much progress has been made in the study of the relations of solar variation and weather. At Washington the laboratories of the observatory were mainly occupied with special war problems.

The art treasures of the National Gallery of Art were greatly augmented by gifts during 1943, including the Widener, Dale, and Rosenwald collections. The gallery gave Sunday evening musical concerts, lectures and accompanied tours for service men and women and their friends. The Zoological park, National museum and National Gallery of Art were visited in the fiscal year ending June 30, 1943, by 1,974,500; 1,355,269; and 1,508,081 persons, respectively. Of these visitors approximately one-fourth represented the armed services. (C. G. A.)

Soap, Perfumery and Cosmetics. Progress of the war had a direct effect on all three of these industries in 1943, primarily on the distributive side. Early in 1943 the U.S. public was permitted to believe that short supply of fats for munitions might necessitate the rationing of soaps. There followed inevitably a consumer "run" on the retail market particularly for kitchen and laundry soaps.

But soap rationing did not materialize and as householders stocked themselves ahead, the run was dissipated so that by the end of 1943 the situation was about normal.

The main distributive outlet for this class of soaps was, of course, the grocery trade. Equally with all other retail business the grocery trade felt the increasing scarcity of consumer goods. And, again like all other tradesmen, grocers looked around outside their accepted field, for lines of goods with which to augment their dwindling stocks.

Toilet soaps, cosmetics and perfumes found much favour in the grocers' eyes and appeared on grocery shelves to a hitherto unequalled extent.

However, in general those cosmetics and perfumes which appeared in the grocery stores were not established lines save only as these might find their way into the grocery stores through obscure channels.

Established cosmetics and perfume manufacturers on the one hand would not willingly jeopardize the good will of their normal distributors (usually the drug, department and chain stores) by seeking this unconventional outlet; and, on the other hand, because of the restrictions on sales volume imposed by continued government limitations of raw materials and supplies, were in no position to open new accounts.

A further factor in this situation was the greatly expanded demand for all kinds of luxury goods resulting from the expansion of consumer buying power and the contraction of civilian goods markets.

Although alcohol continued in short supply, manufacturers of cosmetics and perfumes continued as in 1942 to promote perfumes rather than cosmetics, since in the overall perfumes presented fewer production problems than cosmetics. The solid perfumes which appeared in 1942 made little market headway in 1943 since they shared to a large extent the production difficulties of cosmetics.

The end of the campaign in North Africa and the invasion of Italy, notably the Sicilian campaign, while having had an immediate effect on prices of African and Italian essential oils and other perfume materials, had not by the end of 1943 produced any substantial increase in supplies from these sources although it was, of course, to be expected that such increases must ultimately appear. (H. T.)

Soapstone: *see* TALC.

Soccer. The Brooklyn Hispano soccer club scored a "double" in major soccer play during 1943, winning the American league championship and the national open cup title. The Brooklyn team won the open crown, 4 to 3, over the Morgan-Strasser club of Morgan, Pa., after its first game with the western champions had ended in a 2–2 tie. The Morgan-Strassers won the national amateur championship, defeating Santa Maria of the Baltimore Knights of Columbus in the final.

The Vikings of Chicago won the International league, while the Milwaukee Falks captured the Midwest cup. Maccabi A.C. won both the Eastern league title and the Junior cup of the New York State Football association. The Senior cup of the N.Y. Football association went to Eintracht A.C. The Philadelphia Americans won the Lewis cup, while the Celtic Circles gained the Dr. G. R. Manning cup and the Jewish All-Stars won the Meyer Levine cup. (M. P. W.)

Socialism. The year 1943 saw no international reorganization of socialist forces and while socialist parties in various countries made encouraging gains there was no emergence of organized socialism as the moulder of the coming peace.

United States.—The Socialist party reiterated its desire to further the building of some such mass party as the Canadian Co-operative Commonwealth federation. It declared its intention, despite the increasing difficulties of getting on the ballot in many states, to run a presidential ticket in 1944, with or without allies. In off-year elections Jasper McLevy was re-elected mayor of Bridgeport, Conn., as the candidate of the Connecticut Socialist party which is not affiliated with the national organization. Reading, Pa., Socialists elected J. Henry Stump, a former mayor, to that office, and voted to reaffiliate with the national party with which they had previously co-operated in elections. A member of the Socialist Democratic federation—to be distinguished from the Socialist party—Gertrude Weil Klein, actively connected with the Amalgamated Clothing Workers, was re-elected to the council from the Bronx with the endorsement of the American Labor party.

The most important socialist developments during the year occurred in nations included in the British Commonwealth of Nations.

Australia.—The socialistic Australian Labour party in Aug. 1943 scored an impressive victory by electing 49 representatives to parliament, an increase of 13 over its previous representation and almost double the number of the three opposition parties combined. It also was to have 22 of 36 seats in the senate by July 1944. John Curtin remained as prime minister and interpreted the vote as a mandate against a coalition cabinet. The ministry of postwar reconstruction in his government, established at the end of 1942, set up several commissions during 1943 to plan for industrial and rural reconstruction. Brief dispatches of Dec. 18, 1943, reported that the triennial conference of the party had approved a new policy by the government which was described as a sharp break "with the long-standing tendency of labour towards isolationism and exclusionism."

New Zealand.—In Sept. 1943 the Labour party government under Prime Minister Peter Fraser and Vice-Premier Walter Nash (well known in the U.S. as minister to Washington) was returned to power with a clear, though reduced majority in parliament. The Communists supported it despite opposition to a number of its policies. As in Australia, the Labour party refused to form a coalition government on the ground that it had won endorsement from the people. In November the party representatives urged a program of vacations with pay for all workers, equal pay for equal work, the establishment of a minimum family income and greater socialization of industry. In the previous month the war cabinet had approved a ten-year plan for increasing the national hydroelectric organization.

Canada.—The swing toward the Co-operative Commonwealth federation, first noted in 1942, was emphasized by the success of the party in the Ontario provincial elections of 1943, when it increased its representation in the legislature from 0 to 34 as against 38 members for the Progressive-Conservative party and 15 for the Liberals. The C.C.F. was strongly backed by labour and the farmers, but was not dominated to the degree of the British Labour party by the bloc voting of big unions. It was a socialist party in philosophy and campaigned on the basis of need of "social and economic planning on a bold and comprehensive scale." The party also won two by-elections for the federal parliament, and was endorsed at the September convention of the Canadian Congress of Labour as "the political arm of labour."

Great Britain.—There was no marked change in the position, policy or standing of the British Labour party. It continued to be represented in the Churchill cabinet. The party conference in June 1943 voted by a bigger margin than the previous year to continue the electoral truce and to support the Beveridge plan. Once more it voted (by a card vote of 1,951,000 to 721,000) against the affiliation of the British Communist party. George Ridley, editor of the *Railway Service Journal,* was elected chairman of the party and Arthur Greenwood, acting leader of the Parliamentary Labour party, treasurer over the home secretary, Herbert Morrison. Morrison was also rebuffed when, in the late fall, the party executives dissociated the party from his action in releasing Sir Oswald Mosley on the score of ill-health from the prison in which he had been confined without charges and without trial under an emergency war act. The leftist Independent Labour party continued to have an influence beyond its parliamentary strength. The new Common Wealth party, Socialist but not Marxist, not bound by an electoral truce, made some progress.

The Trade Union congress at Southport, in the fall of the year, pledged itself to fight for a minimum of "four decencies" —in jobs, homes, social security, and educational opportunity for all British children.

Switzerland.—In the only parliamentary elections held on the European continent, the Social Democratic party, advocating more social legislation, increased its representation in the national council (parliament) from 45 to 56 seats out of a total of 194, thus becoming the largest single party. It renewed its campaign in the federal council of 7.

Sweden.—The coalition government, predominantly Social Democratic, while continuing its policy of neutrality, felt able to give active help to refugees, to oppose many nazi demands, and to refuse longer to permit transit of war materials and furloughed soldiers between Germany and Norway via Sweden. It proposed closer co-operation after the war with other northern countries and Russia, and in late September restored full privileges to the communist paper, barred from the mails since the Russo-Finnish War of 1939–40.

Finland.—In February, President Risto Ryti, following his re-election, asked the Social Democratic leader and speaker of parliament, V. Hakkila, to form a coalition cabinet. He failed because of the non-co-operation of the Agrarians, but Socialists accepted representation in the cabinet that was formed. In late September, V. A. Tanner, Social Democratic finance minister, urged an "honourable permanent peace" with Russia, but in December Stockholm dispatches indicated a break in negotiations because of Stalin's insistence on unconditional surrender.

Denmark.—In occupied Denmark Social Democrats were active in the stiffened opposition to nazi rule both before and after the nazi declaration of martial law and the great anti-German demonstrations of Aug. 1943. Social Democrats had previously terminated all connection with the Danish government, and in Denmark as in other parts of occupied Europe were driven into underground activity.

Italy.—Following the fall of Mussolini there was a surprising public manifestation of socialist strength. Socialists were co-operating with other democratic forces in demanding a more complete purge of fascism and the abdication of the house of Savoy.

France.—French Socialists were represented in the provisional consultative assembly meeting in November in Algiers. In occupied France they succeeded in underground publication and distribution of anti-nazi literature. Leon Blum and other prominent French Socialists were presumably held prisoners in Germany to which they were removed in the spring of 1943.

Latin America.—In the Latin-American countries there were

no important changes in the socialist position and policies. In Argentina Socialists continued their agitation for the restoration of civil liberties and parliamentary democracy, both before and after the army coup d'état of June 1943. In Chile, Socialists remained in the Democratic Alliance and held cabinet posts although in the fall they precipitated a parliamentary fight with some of their allies by urging an emergency bill establishing drastic controls over private capital. (*See* also COMMUNISM; LABOUR PARTY.) (H. W. L.; N. T.)

Socialist Soviet Republics: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Social Security. As in other fields of economic activity, the effects of a country at war were felt in the U.S. in every phase of the social security program during 1943. Applications for the various social insurance and public assistance programs decreased drastically, while the reserves of the two social insurance plans—unemployment and old age insurance—were greatly augmented. Under both systems, however, the insured population and the future benefit liabilities increased as more people were drawn into industry at higher wages.

The year 1943 witnessed increasing public interest in social security, mainly due to the introduction of companion congressional bills for a co-ordinated federal social insurance program providing benefits for unemployment, old age, survivors', permanent disability, temporary illness, maternity and death. Sponsored by Senators Robert F. Wagner of New York and James E. Murray of Montana and Representative John P. Dingell of Michigan, the measures would greatly extend the covered population and provide protection for the families of the insured. Despite the increasing discussion, no major social security changes were enacted in congress during 1943. Certain seamen were brought under the Social Security act and an attempt was made to postpone again the scheduled increase in the old age insurance contributions from 1% to 2% each by employers and workers. By the end of 1943, the final action on again freezing the rates for 1944 had not been taken. In the state unemployment insurance laws, however, there were a number of amendments, many of them providing increases in the upper levels of benefits and in their duration.

At the end of 1943, the status of the various social security programs was as follows:

National System of Old Age and Survivors' Insurance.—At the end of June 1943, estimates placed the number of persons with account numbers under this system at 66,400,000, or 63.2% of the population 14 years and over, as compared with 48.7% in 1940. In the fiscal year ending June 30, 1943, $149,304,000 were expended in benefits under this system. On that date, the total assets reached $4,268,296,000, an increase of about $1,000,000,000 over the previous fiscal year.

At the end of Aug. 1943, the system had in force 826,591 benefits valued at $15,058,517. Approximately 15% of these benefits were being held up for a month or more because the beneficiaries were earning $15 or more a month from employment covered by the system. While the August benefits in force grew from 626,170 in Aug. 1942, it was estimated that approximately 600,000 aged persons were eligible for old age insurance benefits but were not applying for them because they were working.

Of the 706,270 beneficiaries who were paid $13,174,563 during Aug. 1943, 296,643, or 42.0%, were persons 65 years of age and over granted annuities in their own right. Supplementary benefits to the wives and children of retired workers numbered 97,249, or 13.8% of the total. In addition, the August roll of beneficiaries included 40,554 widows who had attained age 65; 68,067 younger widows with minor children; 200,091 children age 16, or 18 if attending school, and 3,666 parents. The average payment to a retired worker during Aug. 1943 amounted to $23.19; that of their wives, to $12.34; children, $12.26; aged widows, $20.14; widows with children, $19.66, and parents, $13.09. Lump-sum payments of six times the primary benefits were also made during August on behalf of 10,201 deceased insured workers at a total cost of $1,416,280. These grants are made only when no eligible dependents survive.

Railroad Retirement System.—Under the special national retirement program instituted for the railroad workers, 161,169

THE BEVERIDGE PLAN was a principal issue in a parliamentary by-election of Bristol, England, Feb. 18, 1943. Spectators are shown pausing to look at a candidate's banner in the centre of the bombed city

benefits for $10,356,298 monthly were in force at the end of Aug. 1943. The largest number of grants, 83%, were paid to annuitants who became eligible under the Railroad Retirement act. These beneficiaries received an average of $66.16 in that month. A constantly decreasing number of persons formerly pensioned by the railroads were also protected by this program. In August, there were 23,770 such pensioners receiving an average of $59.08, as well as 3,467 survivor annuities averaging $31.86. Death-benefit annuities numbered 625 and averaged $35.55 while lump-sum death benefits averaging $362.27 were paid on behalf of 1,285 deceased insured persons. In the fiscal year 1942–43, benefits under this system totalled $130,465,000 and receipts amounted to $220,578,000. Assets on June 30, 1943, amounted to $194,896,000.

Unemployment Insurance.—Unlike the two systems described above, unemployment insurance is a federal-state function, with the states and territories administering the programs. The 51 state and territorial plans expended $345,514,909 in benefits during 1942, approximately the same amount as in 1941. While the number of persons who received first payments in 49 jurisdictions decreased from 3,311,386 in 1941 to 2,680,153 in 1942, the average weekly total unemployment benefit rose from $11.06 to $12.66 and the average annual payment from $101.74 to $128.92 between 1941 and 1942. The 1942 average annual payment was $27.18 above that of 1941, $28.77 above 1940, and $44.68 above 1939. The higher payments of 1942 reflected both the higher wages prevailing during 1941 and the liberalization of benefits and their duration. Improvement was also revealed by the decreasing number of states with low weekly benefits. Thus in 1941, 24 jurisdictions paid average total-unemployment benefits below $10 and 10 jurisdictions below $8 while the totals for 1942 were 17 and 2 jurisdictions, respectively. The rate of those who exhausted benefits before re-employment, reported by 47 jurisdictions, also fell somewhat, from 46.7% in 1941 to 40.2% in 1942. The 1942 exhaustions ranged from 16.3% in Alaska to 66.0% in Louisiana. For the country as a whole, benefits were paid for an average of 9.6 weeks of unemployment.

During the first eight months of 1943, unemployed workers received $64,247,329 or 77.3% less than in the corresponding period of 1942. In Aug. 1943, the average weekly number of beneficiaries, 88,848, represented 83.6% less than in the same month of 1942. At the end of Aug. 1943, the funds available for benefits rose to $4,337,308,137 for all the states and territories.

Railroad Unemployment Insurance.—In Aug. 1943, the special program for railroad workers provided 1,565 payments covering 2-week compensable periods. These payments amounted to $40,342 for the month, less than one-fifth the amount spent in Aug. 1942. On Aug. 31, 1943, there was a balance of $382,737,000 in the program's reserve.

National Employment Service.—The employment service, nationalized in Dec. 1941, and transferred to the War Manpower commission in 1942 placed 6,071,329 persons in nonagricultural jobs during the first 8 months of 1943, an increase of 38.9% over the same period in 1942.

Public Assistance.—Though not as drastic as in unemployment insurance, reductions in beneficiaries were recorded in all types of public assistance—old age pensions, aid to the blind, aid to dependent children and general relief. The first three plans operated on a federal-state basis; for the fourth, the states received no federal aid. The greatest decrease was, naturally, in general relief, where the 312,000 cases in Aug. 1943, represented a decrease of 43.3% from Aug. 1942. For the same month, there was a drop of about 23.5% in the number of children aided as compared with 1942. The decreases in the number of blind and of aged persons aided—2.5% and 3.9% respectively—reversed the steady accretion in these rolls for many years. In the month of Aug. 1943, 2,163,954 aged persons received assistance amounting to $55,717,491, or an average of $25.75 per person. Average pensions of $27.55 were paid to 76,980 blind persons, who received $2,120,775 during that month. Aid to dependent children averaged $39.32 per family for the 711,776 children in 290,822 families aided while the general assistance average was $25.88 per case during August. The monthly average grant for the blind and for those on relief rose by less than $2 between Aug. 1942, and Aug. 1943, but the averages for the aged and the dependent children increased by $3.50 and $4.80, respectively. (*See* also LAW; RELIEF.) (A. BM.)

Great Britain.—The report on social insurance and allied services submitted to the government by Sir William Beveridge in Nov. 1942, aroused exceptional public interest. In Feb. 1943, a debate was initiated in the house of commons when the then lord president of the council (Sir John Anderson) on behalf of the government accepted the general lines of development of the social services laid down in the report, which he described as a monumental work of great ingenuity, and paid tribute to its author and the high idealism which had inspired his work. Considerable pressure was put on the government by members of all parties to take immediate steps to appoint a minister of social security, but while accepting in principle the recommendations of the report, including the eventual establishment of a ministry of social security, the government at this stage preferred to proceed by using the machinery of the various departments concerned, so that the government might work out a scheme which could be presented as draft legislation for the consideration of parliament. The amalgamation of the various government insurance and assistance schemes into a single unified system, also embracing other aspects of insurance, such as workmen's compensation and burial payments, so far confined to private enterprise, was obviously a task of great magnitude and complexity. Government spokesmen already reported satisfactory progress, and far-reaching developments were anticipated. The term "social security," prior to the Beveridge report almost unknown to the British vocabulary, became a household word.

Parallel with consideration of the Beveridge proposals the general tendency to enlarge the benefits and scope of the existing state insurance and assistance schemes continued.

Following the extension of the income limit from £250 to £420, and increases in rates of benefit which became payable in 1942 under the National Health Insurance, Contributory Pensions and Workmen's Compensation act of 1941, a further important step forward was the Pensions and Determination of Needs act, 1943, which became operative on Aug. 30.

The main provisions of this act were: the extension of the supplementary old age pension scheme administered by the assistance board, to include widows receiving a widows' contributory pension in which is included an allowance for dependent children; a modification in the treatment of capital assets in the assessment of need, and the permissive extension of this to the calculation of outdoor relief by the poor law authorities; also the statutory application of the principles of a "personal" as against a "household" means test to the assessment of need under the poor law. The effect of the first provision relating to widows with dependent children was twofold. Previous to the act such widows who had not reached the age of qualification for an old age pension, and who found the widows' pension insufficient for their needs, had to look for assistance to the local poor law authorities. Such assistance was now available in the form of a supplementary pension from the assistance board, a department of the central government. With this change another stage had been reached in the disintegration of the poor law. War conditions doubtless

contributed to making a considerable number of widows self-supporting, and the number transferred from the local poor law authorities to the central authority of the assistance board had not been large, approximately 10,000, but the shift of administration from local to central government was significant In addition, approximately 12,000 pensions were in payment to widows who had not previously applied to the poor law. The second provision greatly modified the manner in which money and investments treated as capital assets were to be computed by the assistance board for the purposes of assessing supplementary pensions and also other allowances granted by the board. The effect of this was further to widen the scope of the supplementary pensions and other schemes administered by the assistance board, by bringing in persons who were previously excluded by the possession of capital, and also increasing the amount of allowances and supplementary pensions paid to those possessing capital sums which did not exclude them.

The act permitted the poor law authorities to adopt the same rules relating to capital in the assessment of need for their purposes. There were indications that most, if not all, of the authorities would accept these provisions wholly or in part.

The third provision applied solely to the poor law authorities and was statutory. This required such authorities to adopt the principles laid down in the Determination of Needs act, 1941, as they applied to applicants for supplementary pensions administered by the assistance board. Consequently all applicants for assistance whether to local funds through the medium of the poor law authorities or to central government funds through the medium of the assistance board were now subjected only to a "personal" test of need (this included wife or husband and dependents) and not to a "household" test which in the past had usually included all members of the household. This was a far-reaching change which for the first time applied uniform principles to the calculation of need to be met from public funds.

A further important advance was the Workmen's Compensation (Temporary Increases) bill which received its third reading in the house of commons on Nov. 5. This was the fourth measure of workmen's compensation introduced since the start of World War II, the cumulative effect of which had been to increase the scales of compensation by broadly 75%, and to spread payments more evenly according to individual needs. Introducing this bill the secretary of state for the home department (Herbert Morrison) stated that it was merely a temporary measure and an anticipation of long-term legislation which the government had under consideration as part of the Beveridge scheme.

The general trend toward a comprehensive system of social security was further exemplified by the increasing tendency of the public assistance committees which directly administered the poor law to effect changes of name. These changes were evidence of new conceptions in the administration of the old poor law, with which were still associated in the minds of possibly the majority of people the rigorous and unsympathetic methods of 100 years before. The changes were much more than the adoption of a fashionable nomenclature; active measures were being taken by many authorities to make their public assistance services effective social services in every sense of the term. Attention was being given to such matters as the special training of staff, the provision of bright and comfortable premises free from "institutional" atmosphere, and to increasing the range and efficiency of their health services.

The development of a comprehensive national health service such as envisaged in the Beveridge proposals was the subject of discussion by the British Medical association which had accepted the principles outlined by Beveridge. Beyond this nothing definite emerged, but there were indications that the organization of a national health service for all citizens covering all requirements might be the most difficult to implement of all the Beveridge proposals. (J. McAt.)

Social Service: *see* CHILD WELFARE; RELIEF; SOCIAL SECURITY.

Societies and Associations: *see* under specific name.

Sociology. Although the impact of World War II had earlier been plainly apparent in the social sciences, 1943 bore witness to the struggle in unprecedented degree, and sociology was one of those most affected.

Chief among the changes brought by the war was the introduction of "area" courses in over 200 American colleges and universities. These were part of the army specialized training program, forming a major share of the subdivision called the foreign area and language study curriculum. The area portion of the FA and LSC accounted for about one-half of the time of the student-soldier, and after several changes in prescribed content arrived at the point where sociology and social anthropology, together with their social-psychological correlates and other social sciences, had much to do with the instruction offered. The FA and LSC men were to be equipped for service as aides to civilian affairs administrators (military government), liaison and intelligence personnel, examiners of war prisoners, and so on. Not only was working knowledge of at least one foreign language necessary, but in addition extensive acquaintance with the physical and human geography, recent political, economic and social development, and the basic features of the social processes, groups and institutions of the culture area or civilization concerned was demanded.

Teams of specialists—geographers, economists, political scientists, sociologists, social psychologists, etc.—were called together, in the larger schools, to provide the instructional staffs. In almost all instances knowledge of the languages concerned was asked of the area specialists, but in some instances—Japanese, for example—the requirement could not always be met. Nevertheless, it is fair to say that those offering area courses ordinarily had high linguistic competence as background of their knowledge of the peoples and countries studied.

This was particularly true of the sociologists, for, with the coming of World War II, social scientists of every variety were expelled from the totalitarian countries and many of them found final refuge in the United States. Among these social scientists the sociologists were perhaps the most prominent, for the traits which led them to break with academic orthodoxy were largely the same as those which kept them from identification with the rising totalitarianisms. Henssler, Gerth, Honigsheim and a host of other emigrés did yeoman service for the FA and LSC. True, there were many persons reared in the United States among the area staffs; only a part of the knowledge of Europe and other world regions came from former inhabitants of those regions—but that part was exceedingly helpful.

The products of the program would unquestionably have much to do with the various undergrounds, revolutionary movements in the axis and satellite countries, the checking of sabotage and espionage, the relief and re-education of civilians, the control of defeated and demobilized armed forces, and the general task of "winning the peace." Whereas the FA and LSC was designed for privates and non-commissioned officers, with a sprinkling of possible later entrants in officers' candidate schools, the civilian affairs training program (CATP), exemplified in the Charlottesville School of Military Government and the ten universities offering courses along parallel lines, was designed for commissioned officers only. Many of them were commissioned directly

from civilian life as having skills and aptitudes fitting them for the administration of civilian affairs under military law: former legislators, executives, business men and technicians. Sociologists and other social scientists had a large part in the training of these men as well, although some of the officers' time was absorbed by topics, such as military law, which did not enter the work of the FA and LSC.

During the summer of 1943 the Social Science Research council began studies of the possibilities of "world regions" as instructional and research foci when peacetime higher learning was resumed. The American Council of Learned Societies turned its attention in a similar direction. Deans and presidents began to assess the worth of area studies as possible means of vitalizing language and social science instruction and of eliminating needless overlapping of courses. The regionalism long associated with the department of sociology of the University of North Carolina seemed to offer some methodological guidance, but its close linkage with problems peculiar to the south apparently made transference to other regions difficult. Human geography also provided a possible organizing strand, as did likewise social history and cultural anthropology. It was clear that when and if area studies were adapted to the purposes of peacetime instruction, sociology would be only one among the many social and humanistic sciences to be drawn upon.

Where the more strictly disciplinary aspects of sociology were concerned, the year was significant in only a few fields. Race relations received much attention, primarily because of the mounting antagonisms manifested in the "zoot suit" and Negro-white riots in Los Angeles and Detroit. Charles T. Johnson's *Patterns of Negro Segregation,* Howard W. Odum's *Race and Rumors of Race,* Alfred M. Lee and Norman D. Humphrey's *Race Riot,* Roi Ottley's *New World A-Coming,* and S. M. Strong's "Social Types in a Minority Group," *American Journal of Sociology* (March) were among the most significant publications. Studies of ideologies from the sociology of knowledge standpoint continued to appear; important were Hans Kelsen's *Society and Nature,* DeGré's *Society and Ideology,* and C. Wright Mill's "The Professional Ideology of Social Pathologists," *American Journal of Sociology* (Sept.). Social-psychological researches such as those conducted by Mass Observation in Britain and the American and British Institutes of Public Opinion continued; an informative account of Mass Observation activities appeared in the *American Journal of Sociology* (Jan.).

An important *Dictionary of Sociology,* edited by Henry Pratt Fairchild, was published; it served a useful purpose in recording contemporary sociological terminology and in pointing out the patterns future standardization must take.

The annual meeting of the American Sociological society, cancelled in 1942 because of transportation difficulties, was held in 1943. Rupert B. Vance of the University of North Carolina had been elected president by mail ballot in June, but under the new constitution took office only after the December meeting of the society. The president for 1943, George A. Lundberg of Bennington college, planned the December program, which was significant primarily for the attention paid to war and postwar topics. The regional sociological societies staged several meetings during the year. At one of them Adolph S. Tomars of City College of New York presented a highly significant paper on "Some Problems in the Sociologist's Use of Anthropology," published in the *American Sociological Review* (Dec.). It bears witness to the fact that the ever-closer drawing together of the two disciplines will be characterized by mutual adjustment which may eventually bring about a consolidation of social and cultural anthropology, sociology, and that variety of social psychology springing from the Cooley-Mead tradition. (H. Bec.)

Sodium Carbonate. Production of natural sodium carbonates in the United States in 1942 increased by 3% over 1941, to 150,619 short tons, all from California. This was only about 4% of the amount of sodium carbonate produced by chemical methods from other products. (G. A. Ro.)

Sodium Sulphate. The output of natural sodium sulphate in the United States in 1941 was 157,524 short tons, a reduction of 16%. During 1942 production capacity was increased to offset heavy reductions in imports from Europe. Production increased to 175,033 tons in 1942, an amount still 7% under the 1940 figure. Canadian production was 128,912 tons in 1942. (G. A. Ro.)

Softball. U.S. army, Camp Bakersfield, Calif., won the national men's championship, while the national women's title went to the New Orleans Jax. Aside from the title tournament at Detroit, little championship softball was contested during 1943. The game, however, was immensely popular in army camps, and softball adherents point with pride to the fact that an army league was formed six days after United States troops had landed in Africa. (M. P. W.)

Soil Erosion and Soil Conservation.

The year 1943 marked a definite trend among enlightened peoples of the world toward agricultural development based on conservation of land and water resources and higher standards of nutrition for human beings. Evidences of such an agricultural revolution were brought into the open for the first time by the United Nations Conference on Food and Agriculture which was held May 18–June 3 in the United States. Representatives of 44 participating nations recognized that soil erosion had in the past destroyed or severely damaged vast areas of the world's land. The conference agreed that if the food needs of all peoples were to be met in future times, the present and potential agricultural land of the planet must be adequately protected from erosion and from other serious damage by effective measures for conserving and rebuilding the fertility of the soil.

United States.—The national soil and water conservation program, started in 1933, advanced more rapidly in 1943 than in any previous year. Technicians of the soil conservation service, U.S. department of agriculture, helped farmers to install conservation-production measures on an additional 27,000,000 ac., with the double objective of increased production of war crops and minimum damage to the land. Of this area, 11,000,000 ac. were within soil conservation districts, and the remaining 16,000,000 ac., representing 365,000 farms, were outside the districts. This brought to 67,000,000 ac. the total area under soil and water conservation programs of varying intensity.

Conservative estimates showed the increased production of strategic crops in 1943 as a result of conservation practices on the 67,000,000 ac. of farm and range land to be three times greater than in 1942.

By the end of the 1943 plowing season, it seemed unlikely that there would be any flagrant widespread plow-up of unarable land. Some thousands of acres of dry land in the southwest were plowed for beans, and pastures in some regions were broken and planted to feed crops; but in most instances rotation systems were established or the land was protected by contouring with properly protected waterways.

Public approval of the principle of wise land use was evidenced by the spread of soil conservation districts during the year. As of Nov. 15, 1943, 970 soil conservation districts, covering

552,830,000 ac. in 2,480,807 farms, had been organized in 43 of the 45 states which had enacted a soil conservation districts law. This represented an increase for the year of 73,701,000 ac. in districts. Over 99½% of the total farm and range land in the United States was in the 45 states which had passed districts legislation.

The soil conservation service held a series of orientation schools and apprenticeship classes in all parts of the U.S. to train personnel in carrying out important conservation jobs requiring minimum equipment, labour and fuel, and having an immediate effect on war crop production. More than 6,000 of these classes were held.

Soil and water conservation work accomplished during the year is described in the following summaries:

The surveying and mapping work of the soil conservation service was continued, and approximately 32,000,000 ac. were covered throughout the year by farm plan surveys.

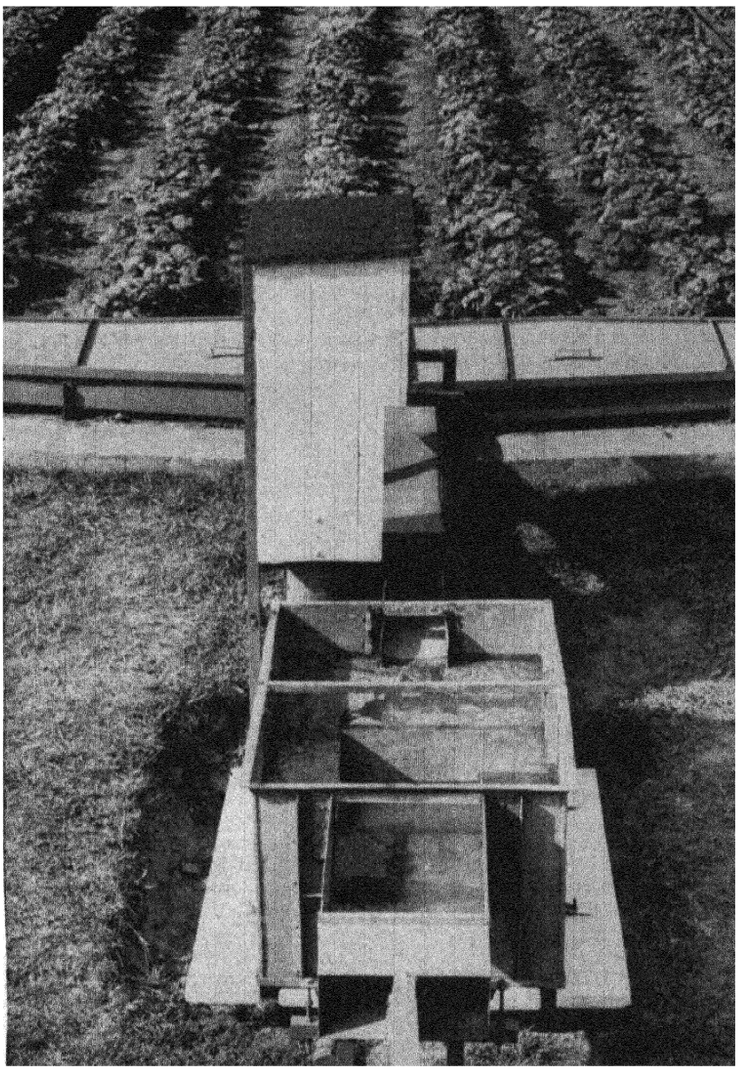
An intensive program was carried out to encourage farmers in all regions to grow and harvest seed of grasses and legumes for use in setting up crop rotations and to help meet scarcities of chemical nitrogen for fertilizer. As a result, millions of pounds of seed of some 20 grasses and legumes were available for treating 2,548,745 ac. with adequate rotations.

Threefold and fourfold increases in corn yields following kudzu and sericea lespedeza were reported, while increases of 500 lb. of peanuts and 15 bu. of oats per acre were obtained from growing crotalaria in the rotation.

Contour planting, a basic soil conservation practice in the United States, spread more rapidly during 1943 than in any previous year. The stubble mulch or subsurface type of tillage was used on several hundred thousand acres in the plains states and in wheat areas of the Pacific northwest to conserve moisture, prevent wind and water erosion, and increase yields.

During 1943, 29 soil conservation nurseries in operation in different parts of the country provided 65,000,000 plants for erosion control plantings. Reforestation work was reduced, chiefly due to labour shortages, but maintenance plantings of shelterbelts in wind erosion areas was continued, and assistance was given farmers in meeting increased needs for wood for farm and industrial requirements. Farm production of fish for food, also a phase of the soil conservation program, increased 44% over the preceding 3-year record: 1,375 farm ponds were stocked and put under management plans.

About 130 small drainage projects were planned or undertaken by soil conservation service engineers during the year, and conservation work in the field of irrigation farming reached a new peak: 750,000 ac. of irrigated lands were benefited by new structures, or other improvements allowing more efficient use of water.



In 1943 the total area of grazing land on which improvement in production had been accomplished through soil conservation methods was brought to 30,000,000 ac., mostly in the 17 western states.

Research and experimental work, essential to an extensive soil conservation program, were continued. Research workers of federal, state and other experiment stations and laboratories, carried on investigations on soil and water losses under various cropping practices and equipment uses; sedimentation as affecting water supply and agricultural use of bottomlands; causes of soil-creep and earth-flow; permissible velocities for field waterways and terrace outlets under different vegetative covers; erosion processes under irrigation; the domestic production of economic erosion control plants.

The Conservation Needs survey of the total agricultural land of the United States, started in 1942 by the U.S. soil conservation service, was completed in Aug. 1943. The survey, based on classification of land according to physical characteristics and best productive use, provides the most complete analysis of agricultural land resources ever undertaken by any country.

Great Britain.—The most intensive development of use of agricultural land ever recorded was carried on consistently in the United Kingdom throughout the first four years of World War II. By the close of 1943, nearly every available acre of ground was under cultivation and incorporated in crop rotation systems designed to maintain soil fertility through the period of war production. Per acre yields of many of the poorer soils of England and Wales were astonishing agriculturists throughout the United Nations: 55 to 60 bu. of wheat to the acre from soils but a few inches over chalk were not uncommon.

By mid-year it was announced that production of food and feed crops in Britain had been more than doubled by planned and controlled expansion of arable acreage coupled with soil fertility improvement methods. At the end of the plowing season the amount of arable land in the United Kingdom had increased to approximately 19,000,000 ac., bringing the increase during the war period to 34% Tillage had increased by 53%. The potato acreage had been doubled, and annual imports of feedstuffs had been reduced from 8,500,000 tons prewar to less than 1,000,000 tons. The grain crop grown in 1943 was more than two-thirds greater than at the beginning of the war, and the total cattle

GAUGE for measuring amount of soil erosion from a cultivated slope

population had increased although it was at an all-time high at the beginning of the war. The year's harvest produced 100,000,000 tons of food, an increase of 70% since 1939.

The unprecedented success of Britain's wartime farm program was attributed in large part to the grassland farming practised in England and Wales for centuries, the highly developed system of rotations, and the watershed control program that had been consistently maintained since passage of the Land Drainage act in 1930. Likewise, by the beginning of 1943 it had become apparent that the war had brought home to leaders and farmers of Britain the inestimable value of the factual data collected by the Land Utilization Survey in the 1930s and published in simplified form in 1941 for use during the emergency period. By employing these data on all phases of land conditions, covering the total land of the United Kingdom, it should be possible to determine the land-use conversions which can be maintained after the war-production crisis.

Having reached the peak of land conversion in 1943, Britain was able to isolate the most serious hazards of her emergency agricultural program. The mountain or rough hill land which covers two-thirds of Scotland, one-third of Wales, and large areas of England, was considered the country's number-one soil erosion problem. Some serious erosion was caused by clearing, plowing and planting these ancient "rough grazing lands" to potatoes or other row crops in 1941 and 1942 without adequate soil conservation measures. By 1943 simple procedures involving pioneer crops and special fertilization had been worked out in some counties so that normal yields of food crops were obtained, but on the whole the erosion hazard remained to be reckoned with

in the postwar period. British experts, well aware of the dangers to the hill lands, were making plans to use modern soil conservation practices in reconverting or revitalizing the hill lands after the war. Several counties of the United Kingdom had already organized such programs by the harvest season.

Severe gullying, caused by up and down hill plowing on steep slopes, was reported from north England, indicating that contour strip cropping would be necessary if the steep drumlins and other lands were to continue in cultivation. Blowing fenland resulting from too much drainage, plus intensive cultivation without windbreaks or proper cover, caused serious loss of high-value soils, and often dust storms.

Canada.—With some 58,000,000 ac. in war crops, and more than twice that amount classed as potentially agricultural, the people of Canada were becoming increasingly aware of the necessity for protecting their lands during the period of rapid expansion. The work of the Prairie Farm Rehabilitation administration which benefited millions of acres in Manitoba, Saskatchewan and Alberta, included conversion of submarginal areas from cropland use to community pastures; water supply development for farm uses and irrigation; and soil and water conservation research through 7 experimental farms, 47 district substations, 17 land reclamation projects, more than 800 regrassing projects, 4 large tree-planting experiments, and 228 farmers' groups known as agricultural improvement associations.

The land utilization phase of the administration's work was proving tremendously successful. In 1943, community pastures covering almost 1,000,000 ac. were in operation, other pastures totalling approximately 300,000 ac. were ready for use or under construction, and work to establish pastures on 2,100,000 ac. had begun. Irrigation had been provided for 221,891 ac., and during the year a program to extend irrigation to approximately 3,000,000 ac. was begun.

In Ontario, action was taken during the year to set up a conservation and rehabilitation program as recommended by the Guelph conference in 1942. Preliminary studies for starting runoff and erosion experiments were under way in the latter half of 1943. Surveys of several areas in Ontario showed drying up of streams and springs, seasonal damaging floods, sheet and gully erosion, and silting and pollution of waters resulting from cutting and grazing of forests, ill-advised drainage schemes, and unwise use of farm land for crops.

Mexico.—The department of soil conservation, established in 1942 to function as a part of the Comision Nacional de Irrigacion, issued reports of preliminary erosion surveys of the entire country and more detailed surveys of two regions. Physical, climatic, social and economic factors were considered in setting up land-capability classes for adapting soil and water conservation methods to the various land types. Erosion was found to be extremely serious in many sections of Mexico. More than 200,000 ac. of formerly cultivated land in the state of Tlaxcala was reported to be completely ruined for further cropping, while erosion had become a major problem on many lands still in cultivation. Extensive reforestation was planned to cover the ruined areas. Terracing, contour cultivation, rotations and soil-improvement measures, particularly by use of leguminous crops as green manure, were recommended for all lands remaining in cultivation.

Surveys similar to the Tlaxcala studies, were in progress in other states during the latter half of 1943.

Australasia.—In Australia 94,000,000 ac. were in agricultural use, with 30,000,000 ac. in crops. Only 8,000,000 ac. of this land, largely in the coastal regions, was considered first-class agricultural land. More than 200,000,000 additional acres were classed as potential agricultural land.

Serious erosion in the form of soil drift resulted from cultivation, without soil conservation methods, in the Mallee districts of Victoria and South Australia. This drew the attention of the State Rivers and Water Supply commission and as an emergency safeguard a soil drift control competition was conducted, offering prizes to farmers using control methods. Many farmers participated in the competition, with the result that drifting was greatly diminished. The practices of leaving stubble on the ground and sowing rye-corn for grazing and drift control spread rapidly during the year.

The Soil Conservation and Rivers Control Council of New Zealand reported that during the year a limited amount of stop-banking was carried out, sand-dune reclamation was continued on a reduced scale, and river-control and protection were undertaken at three or four points.

The problem of erosion in New Zealand was regarded as serious. One-third of the land was subject to accelerated erosion in varying stages, and of 15,000,000 ac. of forest land cleared, largely by burning, in the past 94 years, only 852,196 ac. had been reforested. Studies showed that much of the hill land never should have been cleared. Little, if any, effort had been made to apply erosion control, and overgrazing, burning off, and exploitation of the high country still continued.

China.—Extensive studies on the soils and soil erosion, land utilization, and soil and water conservation needs of the northwestern provinces of Shensi, Kansu and Tsinghai were made during 1943 by Dr. W. C. Lowdermilk, assistant chief of the U.S. soil conservation service, and a staff of eight Chinese soil experts. Demonstration projects and experimental plots were set up, and the first Soil Conservation Association of Farmers ever to be formed in China held its first formal meeting in October. Work of demonstration projects was closely co-ordinated with that of the National Conservancy bureau, including the Yellow River commission, and the ministry of agriculture and forestry.

The National Conservancy bureau of China had completed seven projects to supply water to 282,450 ac. of land suited for irrigation in Shensi. Projects to irrigate an additional 155,100 ac. were under construction. However, the water-supply program, started in 1930 to eliminate the hazards of famine in the region, by watering 2,100,000 ac. of loessial soils rich in fertility, was found to be handicapped for lack of a soil conservation program. The steep slopes were eroding, and it was generally believed that three rivers of the region, the Wei, King and Lo, were supplying most of the silt flowing into the Yellow river.

Heavy cultivation of steep slopes was found throughout the northwestern provinces by Dr. Lowdermilk and his staff members, and return of the land to appropriate uses was recommended. It was proposed that gullied slopes and badlands of great extent be planted to grasses, legumes, willowherbs and trees, and that many thousands of soil-saving dams be built along streams. Much of the gently sloping land could be cultivated with such erosion safeguards as contouring, strip cropping, bench terracing and diversion trenches to carry off unabsorbed rainfall. Many of the bottomlands, where rice and other crops are grown, should be farmed by level terracing.

Field data collected by the survey party headed by Dr. Lowdermilk were submitted to the Executive Yuan in Dec. 1943, together with recommendations for a soil and water conservation program for northwestern China.

U.S.S.R.—Research in soil science, natural meadow compositions and plant migrations, forest soils as affected by various methods of cutting, winter crops, and other phases of conservation farming were continued on many of the government-owned-and-operated state farms of the soviet union. Upwards of 4,000 state farms, comprising approximately 10% of the tilled lands, were in operation during the first two years of invasion. Their major function, experimental work, proved of inestimable value in evacuating old crops to new regions, in extending cultivation to new areas, and in coordinating soil science and land utilization for collective farmers engaged in reclaiming war-torn lands. Under guidance of the state farms, all 1943 spring plowing and sowing in the central and eastern regions was done strictly according to the most approved scientific methods, including soil conservation and fertility-improvement practices. Productivity of the soil rose 30% between 1913–43, and the sown area increased by the same percentage.

Land restoration in recaptured areas proceeded rapidly throughout the year. Seed produced by regional seed production farms and collective farmers far in the rear of the fighting was available to farmers returning to liberated areas; fruit tree seedlings and other plants were supplied by soviet botanical gardens; and farm cattle which had been evacuated to safe areas in 1941 and 1942 were being returned to liberated collective farms with pastures and feed sufficient to maintain them.

Africa.—Only about 20% of the continent is considered potentially arable, and not more than 2% of the arable land is first-class agricultural land. Serious erosion in many parts of the continent was recognized and had led to aggressive action in several African countries to stop soil erosion and water waste even before World War II.

In the Union of South Africa, the soil and veld conservation division of the department of agriculture gave technical advice and aid to farmers in application of soil conservation methods; in reducing cattle grazing on over-stocked areas; in planting grass on eroded areas; and in conducting educational campaigns to induce farmers to protect arable land from erosion by means of contour banks, contour hedges and other measures.

By the close of 1943 studies of the erosion problems of ten areas of varying sizes had been reported, including recommendations for water conservation, diversion of flood waters and protection of watersheds by revegetation. Thirteen thousand dams had been built as a part of the erosion control program, and a vigorous program to improve soil fertility by use of

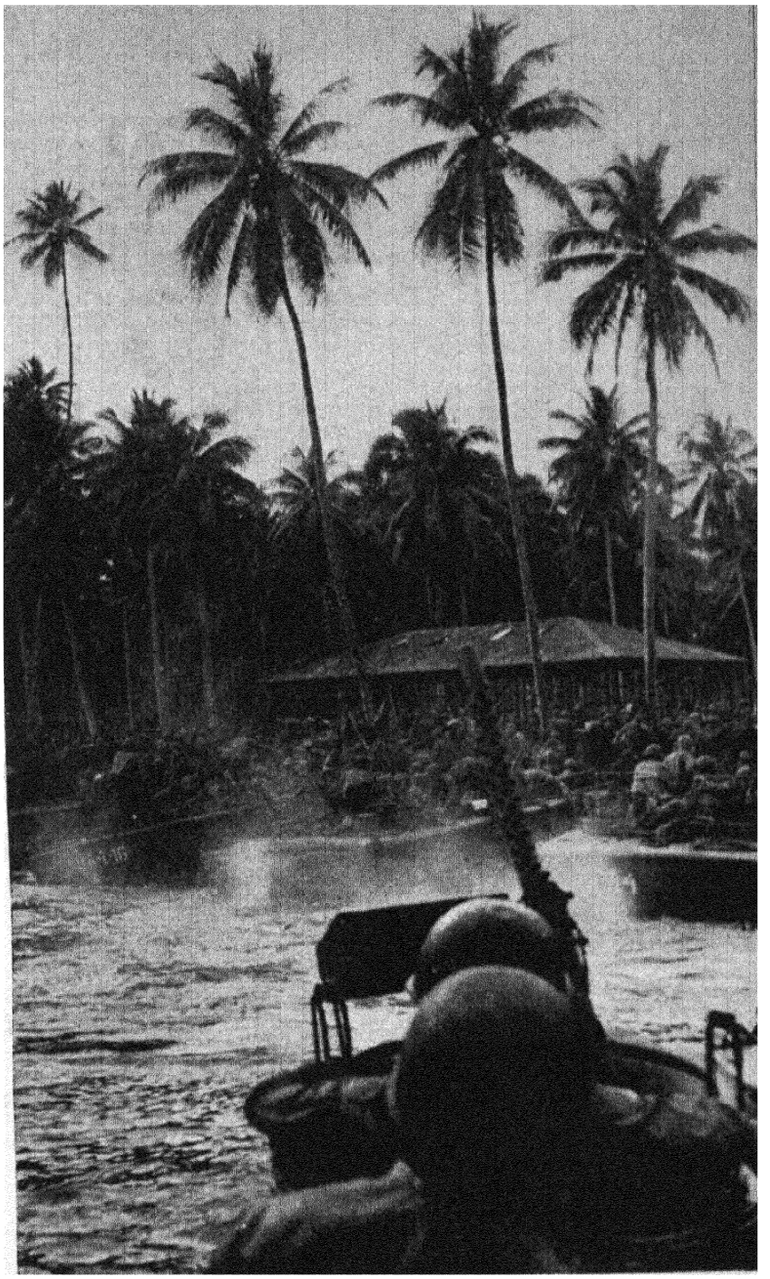
legumes in irrigated areas was well under way. Erosion was known to be serious and damaging in Natal, the Karroo districts, and the mountains of western Cape province where destructive fires had been common for many years.

In the Transvaal, Orange Free State and Rhodesia, badly eroded land was taken out of cultivation and erosion control projects were started. In 1943, the legislative assembly of Rhodesia enacted a law to set up a program for checking erosion damage, particularly with reference to the Mazoe valley. Likewise in Rhodesia, a government decision to pay less for maize grown on eroded land than that from conserved land awakened interest in a more progressive conservation policy. The Central Food Production committee of Rhodesia was co-operating with the Natural Resources board in aiding farmers to follow a long-term policy of production combined with maintenance of soil fertility.

Considerable acreages of sheet erosion and gullying were reported in Central province, Tanganyika, during the 1930s, and by 1943 contour banks were being used to retard the flow of water, and hedges were being planted to protect soils and crops from wind erosion. In Teso district, Uganda, where cultivation of cotton had impaired the soil, strip-cropping, construction of dams, reforestation of steep hills and other anti-erosion measures continued to be applied to the land.

South America.—During the year 1943 the legislative bodies of Colombia, Venezuela and Argentina passed national soil conservation legislation. A soil conservation service was set up in Colombia, to function in the ministry of national economy. In Bolivia and Peru there was evidence that educational programs would be necessary before legislation could be introduced. The ministry of agriculture of Chile was engaged in an extensive program of surveys and experimentation preliminary to launching demonstrations in different phases of soil conservation. A project was under way in Uruguay for creation of a conservation service to be advisory to several ministries of the government. In Brazil, in the state of São Paulo, the experimental station at Campinas already had initiated contour farming and other conservation measures over large areas. Argentina, the only South American country that suffers from extensive wind erosion as well as water erosion, was expected to set up a nation-wide soil conservation program during 1944.

The erosion problems of Latin America were clarified during 1943 through reports from and discussions with representatives of several of the republics who visited the United States to study soil and water conservation methods or to seek technical aid in initiating surveys or demonstrations. The most serious erosion in the northern half of the continent was known to be in the highlands of Colombia and Venezuela, the Andes region of Ecuador, the heavily populated departments of Huanuco and Junin in Peru, and the northeastern states of Brazil where droughts are common.



In the southern half, wind erosion in La Pampa, parts of San Luis and Cordoba, and southern Santa Fe and western Buenos Aires provinces had reached the stage of disastrous dust storms, abandonment of homes, and formation of sand dunes on over-grazed lands and over-cultivated wheat lands, which were left bare during seasons of high winds. Erosion by water was pronounced severe in the territory of Misiones, Argentina, where the annual rainfall is about 100 in. Uruguay, faced with a serious problem of advancing beach sands, had made extensive pine tree plantings in the effort to combat it.

Yields of wheat in many parts of southern Chile were reported reduced by one-half to three-fourths as a result of erosion caused by past farming practices. This led the Chilean ministry of agriculture during the year to project a plan to convert large areas of eroded wheat lands to pasture, and to plant other wide areas in eucalyptus to establish forests and control erosion on badly damaged slopes. (*See* also AGRICULTURE; AQUEDUCTS; DAMS; DROUGHT; IRRIGATION.)

U.S. INVASION BARGES landing on the beaches of Rendova Island in the New Georgia group, Solomon Islands, early in the morning of June 30, 1943. The Americans ousted the Japanese garrison after a short but bitter fight

Solomon Islands. An archipelago in the western Pacific, included in Melanesia and forming a chain (in continuation of that of the Admiralty Islands and New Mecklenburg in the Bismarck archipelago) from N.W. to S.E. between 154° 40′ and 162° 30′ E., 5° and 11° S., with a total land area of 17,000 sq.mi. Administratively the islands are divided between the British Solomons (a colonial possession of Great Britain, with a land area of 11,700 sq.mi. and a pop. [1931] of 94,105, of whom 497 were Europeans) and the northern islands of the group, of which Bougainville is the largest. These belonged to Germany before World War I and were assigned to Australia under a League of Nations mandate after that conflict. Powers of government in the British Solomons are vested in a British resident, whose seat of administration is located on Tulagi Island, off the south coast of Florida Island.

The Solomons constitute a double row of large mountainous volcanic islands, flanked by some small atolls to the north, east and south. They extend for a distance of 900 mi. from Bougainville strait in the northwest to Fakata, or Mitre Island, in the neighbourhood of the Santa Cruz Islands to the southeast. Their northern extremity is marked by the atoll Ontong Java or Lord Howe, their southern by Rennell Island; the intervening distance is 430 mi. The great majority of the natives belong to the Melanesian race, but some 4,000 inhabitants of the outlying

atolls are Polynesians.

History.—The strategic importance of the Solomons had been realized in some quarters in Australia after World War I, but the terms of the league mandate forbade fortification of the northern islands, and the British government took no steps to create air and naval bases in the British Solomons. The base at Singapore was supposed to provide adequate protection for what seemed, before the Japanese onslaught in 1941, a safe and remote part of the world.

The central Solomons area marked the farthest southward penetration of Japanese ground, air and naval forces. A turn of the tide in this combat theatre was marked when U.S. marines seized Tulagi and the important Henderson airfield on Guadalcanal in Aug. 1942. For some time the marines were hard pressed by superior Japanese forces and confined to a relatively narrow beachhead; but decisive naval victories in October and November of that year eased the American position and made it increasingly difficult for reinforcements and supplies to reach the Japanese forces on Guadalcanal.

A steady but slow process of clearing the Japanese from the part of the archipelago which they had occupied went on during 1943, and by the end of the year the Japanese were on the defensive in the last of their major strongholds in the Solomons area, the large northern island of Bougainville. Deadly modern weapons were brought into action on islands where naked savages had formerly fought out their tribal feuds with spears and bows and arrows, and air duels were fought over volcanic islands and small coral atolls. Difficult health and climatic conditions were encountered, and malaria ranked with the Japanese as an enemy. The forward movement in the Solomons was co-ordinated with the clearing of the Huon peninsula in northeastern New Guinea, and with landings, at the end of 1943, in New Britain, an important objective of both drives being the major Japanese base of Rabaul, in New Britain. (*See* also WORLD WAR II.)

Finances, Trade, Education.—Revenue in 1940–41 was £51,320 sterling, expenditure was £65,848. Exports during 1940–41 were £131,938. Among the principal products of the Solomons are bêche-de-mer, copra, ivory nuts, trochas shell, used for pearl buttons, cocoa, rubber, sweet potatoes, pineapples, bananas, yams. Education is in the hands of five missions.

Somervell, Brehon Burke (1892–), U.S. army officer, was born May 9 in Little Rock, Ark., and was graduated from West Point in 1914. During World War I, he was a divisional chief of staff of personnel and operations on the western front, 1918–19, and was assistant chief of staff of supplies of the American occupation force in Germany, 1919–20. During the postwar years, he supervised a number of civilian engineering and construction projects in the United States and in Europe and was WPA administrator for New York city, 1936–40. He was made assistant chief of staff in charge of the army supply division on Nov. 25, 1941, and supervised the shipment of supplies to U.S. armed forces all over the world. On March 2, 1942, Lt. Gen. Somervell was made commander of the army supply services. During 1942 and 1943 he supervised a rapid expansion of quartermaster and ordnance activities. On Oct. 1, 1943, he was nominated by President Roosevelt for the permanent rank of major general. He attended a war conference in Chungking, Oct. 16–20, and later accompanied President Roosevelt to Cairo and Tehran.

Soong, T. V. (1894–), Chinese statesman, was born in Shanghai, the eldest son of Charles Jones Soong, wealthy Bible publisher, and the brother of Mme. Chiang Kai-shek. He attended Vanderbilt university, Harvard and Columbia, where he specialized in economics, and later he worked in New York banking houses. On returning to China in 1917, he worked as adviser to a large coal company in Shanghai; six years later, he became director of the department of commerce with the nationalist government established in Canton. As finance minister, 1928–33, Soong established many reforms, including a budget system, central banking and unified currency. In 1936 he founded the Bank of China. Chiang Kai-shek named him foreign minister. Dec. 23, 1941, while he was in Washington, D.C., as a special envoy. He did not return to China until the following October, having signed a lend-lease agreement with Secretary Hull in the meantime. Soong also spent much of 1943 in the United States. He conferred with Roosevelt and Churchill in Washington in May and participated in the Quebec conference in August.

South Africa, The Union of. A self-governing dominion of the British commonwealth of nations. The four provinces of which it consists, the Cape of Good Hope, Natal, the Transvaal and the Orange Free State, extend from the southernmost point of the African continent to the Limpopo in the north. The former German colony of South-West Africa (pop.: European 33,600; Bantu and Coloured 287,731) is administered under mandate as an integral part of the union, but this territory has not been incorporated as a province. Area 472,550 sq.mi. (incl. Walvis bay, 430 sq.mi.); pop. (est. June 30, 1941), 10,521,700 (Europeans, 2,188,200; Bantu, 7,250,700; Coloured, 844,400; Asiatic 238,400). Chief towns (pop. census 1936): Cape Town (seat of legislature) (344,223); Johannesburg (519,384); Durban (259,606); Pretoria (seat of government) (128,621); Port Elizabeth (109,841). Governor-general in 1943: Rt. Hon. M. J. de Wet; premier: Field Marshal Jan C. Smuts. Languages: English, Afrikaans. Religion: European population: Christian (Dutch Reformed Churches 55%; Anglican, 19%; Methodists, 6%; Presbyterians, 5%).

History.—During 1943 South African affairs again fell under the three interlocked categories of war, industrial development and party strife. Prime Minister Smuts warned his people that the hardest fighting was still to come but that they must be "in at the finish" in Berlin. Thereafter he looked forward to sharing in the task of restoration as the union's "reparation policy." Having recognized the French committee of National Liberation and drawn a sharp distinction between the nazis and "another and better Germany," he went to London (Oct.) to take his seat in the British war cabinet.

The union had begun to feel the pinch of the war toward the close of 1942, when the cost of living had risen 20% above that of 1939. Smuts's United party ministry was strained by grumbling at its new "austerity" policy, and friction between its Labour left wing and its Dominion party right. Dr. Daniel F. Malan, the Nationalist leader, still confident of a German victory, played up to the British section of the electorate by harping on soldiers' grievances and tried in vain to re-unite all the opposition factions on a stop-the-war Afrikander basis. His position had been strengthened by the death of his rival, General J. B. M. Hertzog, in Nov. 1942. The ministry was further shaken by the momentary resignation of J. H. Hofmeyr, its second in command, who ac-

SOUTH AFRICA'S FIRST DIVISION was welcomed home in Cape Town in 1943. These troops cracked the nazi defenses at El Alamein in Oct. 1942

cepted the renewal of a "pegging" bill, which forbade Indian traders in Transvaal towns to penetrate European areas during a term of years but objected to its extension to residential areas in Durban (Natal). Smuts refused to accept his resignation, and thereafter the ministry was helped by the course of the war and a hopeful budget. Increases were made in excise, postage, income tax surcharge, special contributions from the diamond and gold mines (the latter now standing at 22½%), personal and savings fund levies, state railway fares and a 50% increase of the tax on foreign shareholders.

Smuts won a resounding victory on the war issue at a general election in which the soldiers took part (July). His United party did unexpectedly well in the Afrikander rural areas and gained a majority of 89 to 64 over all other parties. Labour gained markedly. The Communists failed completely in spite of their appeals to the harassed Negroes. Nicolaas Havenga's Afrikaner (Neutrality) party was wiped out. Oswald Pirow's New Order party, perhaps prudently, boycotted this democratic election. Malan's Nationalists at least formed a solid block, which might grow if times are bad after the war. The state of the parties was: United party, 89 (72); Labour, 9 (4); Dominion, 7 (8); Independents, 2 (0); Europeans representing the natives, 3 (3); a total of 110 in support of the war policy against the Nationalists, 43 (41). A few days after the election Sir Patrick Duncan, the governor-general, died.

An Industrial and Agricultural Requirements commission foreshadowed a fairly speedy decline in gold production, saw small hope of agriculture's coming to the rescue and noted that the remarkable wartime scale of secondary industries can hardly be maintained when prices again become an object.

The budget devoted the entire proceeds of native taxation to native education and made a beginning of giving all school children of whatever colour one square meal a day. Meanwhile the union's industries maintained an army of 150,000, out of an "occupied" European population of 750,000, and sent much to the Allies. A joint Union-United Kingdom-United States supply council was formed to carry this work farther (Sept. 1943).

Finally the legislative council of Mandated South-West Africa asked unanimously for incorporation as the fifth province of the union (Sept.). Smuts replied that this would be considered but that the League of Nations must be approached first.

(E. A. WR.)

Education.—In 1939: state and state-aided primary and secondary: European schools, 4,014; scholars, 391,056; non-European schools, 5,131; scholars, 620,384; universities, average number of students 10,505.

Banking and Finance.—Revenue (est. 1942–43) £91,400,000; expenditure (est. 1942–43): ordinary £63,700,000, war £80,000,000; revenue (est. 1943–44) £108,500,000; expenditure (est. 1943–44): ordinary £67,500,000, war £96,000,000; public debt (Dec. 31, 1942) £425,000,000; notes in circulation (Feb. 28, 1943) £40,300,000; gold reserve (Feb. 28, 1943) £63,500,000; exchange rate (average 1943) £1 SA = $3.98.

Trade and Communication.—External trade (1940) (exclusive of goods in transit and of gold bullion and specie): imports (total) £105,099,234; exports (domestic) £28,562,207; re-exports £5,528,430. Communication and transport: roads fit for motor traffic (1938–39) 87,495 mi.; railways, including South-West Africa (March 31, 1940), 13,645; airways, including South-West Africa (1939): passengers carried, 35,578; freight and mails carried, 2,640,984 lb.; mileage flown 1,751,453; shipping (1940) entered, 6,598; net tonnage 25,504,068; cleared, 6,554; net tonnage 25,315,168. Motor vehicles licensed (Dec. 31, 1940): cars and taxis, 317,958; vans and lorries, 51,215; tractors 1,044; cycles 21,725; wireless receiving set licences (1940) 283,119; telephones, instruments in use (1940) 202,753.

Agriculture, Manufacturing, Mineral Production.—Production (1940–41) (in metric tons): gold (1942) 14,120,617 fine oz., declared value £118,613,108; (1941) 14,386,361 fine oz.; declared value £120,845,424; diamonds (1939) 1,269,828 metric carats; maize 2,159,100; coal (1940) 17,493,000; sheep, number (Aug. 31, 1939) 38,289,430; cattle, number (Aug. 31, 1939) 11,852,736; wool (1940) 125,000; wheat, European cultivation, 460,800; cane sugar, refined, 467,800; iron ore (metal content) (1940) 396,000; pig iron and ferro-alloys (1940) 304,000; steel

(1939) 314,000; silver (1940) 40.2; manganese ore (metal content) (1940) 174,500; chrome ore (chromic oxide content) (1940) 73,300; asbestos (1938) 21,900; wine (1938–39) 1,555,000 hectolitres; tobacco, European cultivation, 13,800; potatoes (1938–39), European cultivation, 196,800; oats, European cultivation (1939–40), 80,700; barley, European cultivation (1938–39), 20,500; mohair (1940), export, 1,900; copper (smelter production) (1940) 13,600; ground-nuts (1938–39), European cultivation, 13,500; benzol (1939) 1,700; superphosphates of lime (1937) 164,000. Industry and labour: (census 1939) establishments 9,837; employees, European, 117,056; others 189,087; value of gross output, £172,764,000; value added to materials used, £85,108,000. Employment index (average 1929=100) average 1941, 164; Feb. 1942, 172.

South America: *see* ARGENTINA; BOLIVIA; PERU; ETC.

South Australia. A state of the Australian commonwealth 380,070 sq.mi. in area, bounded by longitudes 129° E. and 141° E., and by latitude 26° S. and the southern coast of the continent. Population (est. Dec. 31, 1941) 605,689. Chief city and capital (pop. Dec. 31, 1940), Adelaide, 330,000. Governor in 1943: Sir Charles Malcolm Barclay-Harvey.

History.—The industrialization of the state consequent upon the demands of war and in spite of acute manpower problems continued during 1943. Figures released for factory output during 1942 showed more than 35% increase over the previous year. Among new industries established in 1943 was a £600,000 plant for reforging scrap steel and a £500,000 chemical plant which, after the war, was to be converted for the production of fertilizers. Seasonal conditions were excellent and rural production consequently high. The wheat crop returned a record yield of 18.18 bu. per ac. The government announced a five-year postwar road plan for the construction of 3,000 mi. of roads at a cost of £A3,500,000. The plan covers more than 100 roads in all parts of the state.

Education.—In 1939: state primary schools 1,004; teachers 2,556; average daily attendance 55,672.

Finance.—In 1941–42: revenue £A15,002,000; expenditure £A13,715,000; debt outstanding (June 30, 1942) £A109,190,000.

Communication.—Roads (March 31, 1940): 52,330 mi. Railways (1942): government, 2,547 mi. Motor vehicles licensed (March 31, 1943): cars 54,401; trucks 22,794; cycles 6,131. Wireless set licences (March 1943) 147,145.

Agriculture and Manufacturing.—Wheat (1942–43) 37,000,000 bu.; barley (1941–42) 11,700,000 bu.; wine (1941–42) 11,140,000 gal.; currants (1941–42) 9,872.6 short tons; wool (1941–42) 105,000,000 lb.; butter (1941–42) 20,370,000 lb. Industry (1941–42): factories 2,233; employees 67,000; gross value of output £A61,000,000; unemployment (March 31, 1943) 1.0%.

(W. D. MA.)

South Carolina. A south-Atlantic state of the United States, and eighth of the original 13 to ratify the constitution, 1788; popularly known as the "Palmetto state." Area, 31,055 sq.mi., including 461 of inland waters; pop. (1940) 1,899,804; white 1,084,308; Negro 814,164; others 1,332; 75.5% rural; 0.3% foreign-born. Capital, Columbia (62,396). Other cities include Charleston (71,275); Greenville (34,734); Spartanburg (32,249).

History.—Olin D. Johnston, elected governor in Nov. 1942, was inaugurated Jan. 19, 1943. Having served from 1935–39, he was the first to serve a second term after the term was raised from two years to four with immediate re-eligibility forbidden.

The legislature extended state support for schools from eight months to nine; raised teachers' salaries (which any district might supplement) 15%, and assumed practically the entire expense for bus transportation of pupils; appropriated $186,000 for school lunches; raised state employees' pay 10%; voted $50,000 for postwar planning; appropriated $6,800,000 to reduce state debt; eliminated primary election laws for fear of federal action on the rule excluding Negroes from the Democratic party, thus leaving primary regulations to private party action; passed a law requiring physically fit males 16–60 to work or fight; discontinued the low state tax on general property, leaving this to local governments, which were also given state aid. In addition, the governor vetoed a marriage protection act on the ground that it was too feeble to be effective, and the legislature defeated an effort to permit the $57,000,000 Santee-Cooper hydro-electric authority to buy two large companies for $40,000,000, fearing politico-economic monopoly power. A suit to compel equal pay for white and Negro teachers brought no results.

The total state appropriations of $18,161,555 were the largest in the state's history. Highway gasoline revenues, however, fell to about half. Farm wages were the highest in 20 years.

Mrs. Sue Logue, executed together with several men for murder, was the first woman to be electrocuted in the state, but not the first to be executed. The only one of the penal officials charged with corruption so far tried was acquitted, though bad conditions were undoubted. A sheriff was sent to jail for 60 days for depriving a prisoner of federal constitutional rights. The 250 Catawba Indians (largely mixed with white and Negro blood) were by agreement with the U.S. provided at joint expense with more land, schools, and direct support, admitted to citizenship, and transferred to federal supervision.

The state supreme court ruled that Methodists refusing membership in the reunited church might use the name Methodist Church South, but not any of its property. Dissenters number a few hundred.

Education.—Enrolment in white elementary schools for the year ending June 30, 1943, was 186,230 (a decrease of 2,070); Negro 186,236 (a decrease of 5,317); high schools, white 71,294 (a decrease of 2,986); Negro 21,692 (an increase of 615). White elementary teachers 6,310, high school 3,011; Negro teachers 5,188 and 667 respectively; expenditures $16,753,801 for whites, $3,618,591 for Negroes. All men's colleges were taken over during the year for the training of soldiers.

Public Welfare, Charities, Correction.—In the year ending June 30, 1943, federal allocation for needy persons totalled $1,752,000, to which the state added $100,000. The amount of $1,319,500 went to the aged, $390,000 to dependent children; 27,777 persons were assisted. Total allocation for the year ending June 30, 1944 was $2,349,500. State unemployment trust fund rose to $27,264,933 by Dec. 31, 1943, supplied entirely by employers, while payments to unemployed during 1943 dropped to $566,770, a decline of 70%. Payments for the 12 months ending June 30, 1943, totalled $940,219. Patients in the state hospital (for mentally diseased) on June 30, 1943, numbered 4,688; on parole, 775; in feeble-minded school, 853. Prisoners in penitentiary and state farms June 30, 1943, 1,084; legal executions during year ending same date, 9.

Communications.—Paved highways on June 30, 1943, comprised 7,230 mi.; earthen state highways, 4,747 mi.; railroads, 3,563 mi.

Banking and Finance.—On June 30, 1943, there were 22 national banks (plus 19 branches), 84 state banks (plus 4 branches), 39 cash depositories with deposits and resources as follows: national banks and branches, $220,375,000 and $233,671,000; state banks, branches and depositories, $107,272,986 and increased resources. Resources of federal building and loan associations totalled $25,890,773; state associations, $11,848,331. State debt

June 30, 1943 was $68,246,511, of which $61,958,913 was for highways. Federal internal revenues collected year ending June 30, 1943, $105,673,000.

Agriculture.—Value of crops in 1943 was $231,315,000, 17% above the 1942 figure and the highest since 1919, when crops were valued at $360,000,000. Labour and equipment shortages were considerable. Of total crop values, vegetables supplied $12,432,000; 90% of the peach crop was frozen in April.

Table I.—*Leading Agricultural Products of South Carolina, 1943 and 1942*

Crop	1943 (est.)	1942
Corn, bu.	24,720,000	21,330,000
Wheat, bu.	3,002,000	3,377,000
Oats, bu.	14,102,000	13,401,000
Hay, tons	479,000	550,000
Irish potatoes, bu.	3,193,000	3,108,000
Sweet potatoes, bu.	6,900,000	5,890,000
Tobacco, lb.	87,400,000	96,750,000
Cotton, bales	695,000	699,000
Cotton seed, tons	309,000	311,000
Peaches, bu.	392,000	3,500,000

Manufacturing.—The total value of manufactures for the year ending June 30, 1943, was $1,062,402,844; employees numbered 167,718; wages, $208,195,102.

Table II.—*Principal Industries of South Carolina, 1943 and 1942*

Industry	Value, 1943	Value, 1942
Textiles	$771,575,622	$623,870,751
Lumber and products (boxes, paper pulp, etc.)	71,113,724	61,116,950
Electricity	25,602,965	23,080,314
Clothing (including knitted)	20,620,709	15,341,032

Mineral Production.—Production for 1943, chiefly stone and clay, aggregated $4,493,522. (D. D. W.)

South Dakota. A north-central state, admitted to the union Nov. 2, 1889; popularly called the "Coyote state." Area, 77,615 sq.mi. (land area, 76,536 sq.mi.); pop. (1940), 642,961; urban population, 158,087; rural population, 484,874; average number of inhabitants per sq.mi., 8.4. Capital, Pierre (pronounced "Peer" by South Dakotans) (4,322). Largest city, Sioux Falls (40,832). Ten cities had a population above 5,000 in 1940. In 1943 the state's population was substantially reduced by migration to defense centres. An estimate by the director of the state census placed the total population as of Dec. 31, 1943, at 550,000.

History.—M. Q. Sharpe, governor (Rep.), took office Jan. 5, 1943. All partisan state elective offices were held by Republicans. The legislature, made up of 100 Republicans and 10 Democrats, was in session from Jan. 5 to March 5. In addition to routine legislation, administration-backed laws were passed providing for tithes from specified departments; establishing a department of audits and accounts under a comptroller; reducing the unemployment commission to one member; and authorizing a study of compulsory education through high school. The tithing law met vigorous opposition from sportsmen and from gasoline taxpayers. An action in the state supreme court nullified the law as it applied to the highway department and permitted it to be referred. Although opponents of the law circulated petitions to refer it, the referendum was denied on the grounds of insufficient legal signers. A hearing on the question of the law's constitutionality was set for the Jan. 1944 term of the supreme court.

Education.—The school census, ages 5–21, was 164,976 in 1943 compared with 186,258 in 1940.

Finance.—Total receipts for the fiscal year 1942–43 were $38,000,000; disbursements were $33,700,000; balance, $16,400,000. The net bonded state debt was $28,367,191.85.

Agriculture.—In 1943 the crop value was $244,170,000, an increase of $10,000,000 over 1942. In the nation, South Dakota was first in rye; second in durum wheat; third in barley, flax and wild hay; fourth in all spring wheat; fifth in sorghum forage; seventh in all wheat and oats; eleventh in corn. The total production was sharply reduced over 1942 but was well above the ten-year average for the state. (L. K. F.; X.)

Principal Agricultural Products of South Dakota, 1943 and 1942

Crop	1943 (est.)	1942	Crop	1943 (est.)	1942
Corn, bu.	87,800,000	103,214,000	Wheat, bu.	32,545,000	45,274,000
Oats, bu.	73,300,000	90,400,000	Hay (tame and wild), tons	2,242,000	3,009,000
Barley, bu	36,414,000	59,364,000			

Southern California, University of. An institution of higher education at Los Angeles, Calif., comprising 25 schools and colleges.

During 1943 it endeavoured to preserve and advance the traditional academic program; nevertheless a rather strictly wartime campus prevailed, and the educational work was adjusted to train men and women for war service. The calendar year was divided into three major terms of 16 weeks each, the accelerated program preparing more men in less time.

The 1,200 men in the navy V-12 curriculum, including 300 marines, and 200 N.R.O.T.C. trainees, were supplemented by 400 army premedical and predental students. More than 4,000 adults enrolled in night classes in engineering, science and war training, sponsored by the U.S. department of education.

Special work was offered in occupational therapy, nursing and nursery school education, aviation medicine, and psychological clinic. Certain major divisions (engineering, mathematics, medicine, dentistry, chemistry, physics) overflowed with students, while other departments suffered decimation.

Alumni numbering 5,000 were in the service of the armed forces in 1943; 150 staff members were on special leave for war effort. For statistics of faculty, student enrolment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (R. D. HU.)

Soybeans. The soybean by 1943 had risen to a prominent place as a wartime crop in the United States, as it had in Europe. As a food for animals and man, and particularly as a source of oil, its culture in the United States increased almost 400% over the prewar average. The War Food administration set a goal of 12,000,000 ac. for 1943 and the crop was estimated to be 95% of the production goal. Total 1943 production was estimated by the U.S. department of agriculture to be 206,117,000 bu. compared with 209,559,000 bu. in 1942 and 51,571,000 bu. as the 10-year average, 1932–41. While the acreage was increased in 1943 to 11,480,000 from 10,762,000 in 1942, the yield was only 17.9 bu. per ac. in 1943 as compared to 19.5 bu. per ac. in 1942. In areas outside the central states large areas were cut for hay because heat and drought damaged the prospects for beans and also because of a shortage of other hay crops.

Prices for soybeans were supported by the government through arrangements with the oil-seed crushers which required them to pay the minimum price of $1.00 per bu. for No. 1 beans. All beans purchased by crushers were required to be sold to the Commodity Credit corporation and then repurchased at certain

U.S. Soybean Production by Leading States, 1943 and 1942

	1943 bu.	1942 bu.		1943 bu.	1942 bu.
Illinois	70,602,000	66,400,000	Kansas	2,318,000	2,544,000
Iowa	39,332,000	35,451,000	North Carolina	2,313,000	3,484,000
Ohio	27,993,000	24,398,000	Mississippi	1,704,000	2,842,000
Indiana	27,084,000	26,380,000	Michigan	1,596,000	2,114,000
Missouri	8,696,000	7,065,000	Virginia	1,056,000	1,782,000
Minnesota	3,321,000	3,549,000	Wisconsin	1,054,000	780,000
Arkansas	2,536,000	3,255,000	Kentucky	858,000	1,066,000

All other states produced less than 1,000,000 bu. of beans. Soybeans grown for hay not included.

fixed prices designed to enable the old type plants to operate and to secure the maximum oil output. Even with the full use of all available plants in the soybean growing area, a part of the crop had to be shipped to the south and west for crushing, the extra cost of transport being paid by the government. The growing need for oil was shown by the increase in goals set up for 1944 by the War Food administration which called for 14,000,000 ac. compared to the 12,000,000 ac. goal for 1943. It was expected that by 1944 farm machines for soybean culture and handling would be available in quantity sufficient to care for the increase in the crop. In Iowa and Illinois, where most of the crop is grown, it was expected to take the place of oats and pasture. (*See* also CHEMURGY.) (J. C. Ms.)

Spaatz, Carl A. (1891–), U.S. army air officer, was born June 28 in Boyertown, Pa. He was graduated from West Point in 1914, studied at the aviation school in San Diego in 1915 and participated in the Mexican campaign a year later. During World War I, he commanded a pursuit squadron in the St. Mihiel offensive in 1918 and was decorated for shooting down two enemy planes. After the war he was stationed at various U.S. flying fields, and in 1929 he piloted the army plane that established a record of 150 hr. and 40 min. in an endurance flight over Los Angeles. Advancing rapidly in the air corps, he was chief of staff to Gen. Henry H. Arnold in 1941, and soon after Pearl Harbor he took over the air force combat command. In July 1942, he was named U.S. air commander in Europe. Early in 1943 he was shifted to the Mediterranean theatre as commander of the 12th U.S. air force and of the United Nations' Northwest Africa air forces. In November, Algiers announced creation of a new U.S. 15th air force, also under command of Lt. Gen. Spaatz, to concentrate on bombing, from Mediterranean bases, targets in Germany and occupied Europe. A raid on a Messerschmitt assembly plant in Austria was the first mission. On Dec. 24, 1943, President Roosevelt announced the appointment of Gen. Spaatz as commander of "the entire American strategic bombing force operating against Germany" from all directions. The command of the 15th air force was taken over by Maj. Gen. Nathan F. Twining.

Spain. A southwestern European state, occupying about 84% of the Iberian peninsula. Area (including the Balearic and Canary Islands): 194,804 sq.mi. Pop. (1940 census): 25,877,971; in 1930 it was 23,563,867. The capital is Madrid (1,088,647). Other leading cities are: Barcelona (1,081,175); Valencia (450,756); Seville (312,123); Málaga (238,085); Zaragoza (238,601); Córdoba (143,296); Granada (155,405); Murcia (193,731); Valladolid (116,024). The language is Spanish, the state religion, Roman Catholic. Chief of state, or caudillo, in 1943: Gen. Francisco Franco.

History.—When 1943 ended Spain had still managed to retain her status as one of the few officially neutral (or rather non-belligerent) nations in a world at war. As in 1942, a heavy political and financial debt to the axis powers, a position in uncomfortable proximity to German military might, and a definite affinity to totalitarian philosophy inclined her leaders toward support of the axis. At the same time her exposed position in regard to Allied attack, in case of belligerency (in 1943 even more apparent as the attack on Italy developed), her desperate poverty after her own civil war, and her need for certain essential items from the Allies, made it impossible for her to risk an Allied attack.

Insofar as the nations at war were concerned, both sides were content with Spanish neutrality for the time being. Germany could obtain some supplies from Spain, and if she tried to secure a Spanish entry into the war on the axis side, might open another sector demanding defense. The United Nations had enough to concentrate upon in other areas, and gains would not be commensurate with risks and expenses involved in an attempt to force Spanish support of their side. For these reasons it was logical that United States Ambassador Carleton Hayes could announce in January that the United States was not trying in any way to oust the Franco regime, and that Great Britain and the United States could agree to deliver to Spain 50,000 tons of cotton in the first part of the year. By August somewhat more pressure was in evidence, with a demand by the British ambassador, Sir Samuel Hoare, that Spain assume an actual rather than a nominal neutrality. Likewise the United States in the same month refused to sell arms and ammunition to Franco when such a purchase was proposed. In the last few weeks of the year news stories seemed to foreshadow a possible economic boycott of Spain in 1944.

The United Nations particularly objected to the participation of the Spanish "Blue Division" in the German operations in Russia. This force, officially only a private group of volunteers, had been large enough so that its losses in Russia were reported as high as 7,000 men. A general of the division, Agustín Muñoz Grande, a Falangist and strongly pro-axis, was at the head of the Spanish military cabinet in the early months of the year, and there was little doubt of Spanish governmental backing of the unit. Due to Allied representations, by September members of the division were returning to Spain in some numbers, and in October it was unofficially reported that Franco had decided to withdraw the force completely.

On April 16 Spain officially offered her "good services" as mediator to the two parties at war in World War II, but for obvious reasons the offer was ignored by the United Nations.

Rumours that the monarchy was to be restored by Franco were heard fairly frequently, as in 1942, since many of his strongest supporters were monarchists. In August, however, news reports indicated that Don Juan, prince of the Asturias and claimant to the throne, had broken off all contacts with Franco and was to try to work for restoration independently.

Political prisoners were released in 1943 in somewhat greater numbers. In June it was announced that over 3 000 would gain freedom, with double that number to follow, and in July the government stated that some 10,000 more would be released. That real opposition to the Franco regime was still in existence, however, was evidenced by a successful effort of saboteurs at El Ferrol, the northern Spanish naval base, where fires were set on May 20 that did much damage to docks and installations, and possibly to two cruisers and several destroyers.

On Dec. 20 the Falange (the only recognized party in Spain) announced that the party militia would be dissolved and that the army would take over its work. It was also stated that liberty of the press would be established and that some modification of the party organization would take place.

In spite of poverty at home, Spain managed to maintain service on her external debt. An announcement was made in July that the Spanish Foreign Exchange institute planned to arrange for payments on American commercial accounts for obligations in-

curred prior to July 18, 1936, which were still in arrears. The government also proposed to reconstruct University City at Madrid, wrecked during the civil war of 1936–39, at a cost of 225,000,000 pesetas, with another 75,000,000 pesetas assigned to improvements in other universities.

Barter agreements were discussed with Switzerland and Sweden during the year, particular effort being made by Spain to dispose of the Malaga raisin crop. The German-controlled airline in Spain officially was turned over to Spanish operation, but there was doubt as to whether the transfer was genuine. An agreement over blocked credits with Cuba foreshadowed improved commercial relations with that country.

Internal shortages continued, although news reports contained mention of official projects involving much industrial construction of all types, but particularly of chemical plants, shipyards, and electrical installations, all designed to make Spain more nearly self-sufficient.

Education.—Education is nominally compulsory and free; the church has a part in religious instruction. Extensive reconstruction of Spanish universities was projected during the year.

Finance.—The official monetary unit is the peseta (value in 1943: approx. 9 cents U.S.). The currency is artificially controlled. Currency in circulation June 30, 1943, was 15,192,937,654 pesetas. Expenditures for 1943 were set in the budget at 9,456,475,296 pesetas (1942: 7,969,778,147 pesetas). During the year the income tax system was revised, with the federal "renta" or special income tax increased on higher incomes, and the state special income tax (the "cedula") repealed, with the federal government compensating the provinces for the loss.

Trade and Communication.—General trade figures for recent years were not released (1940 exports: $128,839,000; imports: $202,754,000). Estimates on the export of bitter oranges were 263,750 cases in amount (1942: 285,000 cases). Nut exports were comparatively small. Cotton imports for the first 9 months of 1943 amounted to 6,962,442 short tons (total for 1942: 7,694,693 short tons). Dried bean imports (87% of which came from Argentina, the United States, and Mexico) totalled 51,023 short tons.

Some improvement in communication was claimed; in Nov. 1942, locomotives in service numbered 2,550 as against 1,837 in 1939. A link of the new Coruña-Madrid railway line was opened in April 1943. Electrification of many lines was being continued. Much activity in ship construction was reported, with 187 vessels on order and a number of these under actual construction. Shipyards were authorized at Bilbao and Alicante during the year, and 43 harbour improvement projects were carried out. A merchant fleet of 1,056,875 tons was claimed to be in operation.

Agriculture.—Production in 1943 was still under normal years. Cereal crops in 1942 were estimated as follows (in short tons): wheat, 3,269,466; oats, 722,717; rye, 591,593; barley, 2,004,224; corn, 774,469; rice, 160,533. Potato production amounted to 3,728,320 short tons. The bean crop (1942) amounted to 165,345 short tons; chickpeas or garbanzas amounted to 107,474 short tons; lentils to 16,535 short tons; peas to 33,069 short tons. Edible oil production amounted to 220,460 short tons of olive oil (1942–43); 1,764 short tons of filbert oil; 441 short tons of almond oil; also 528 gal. of fish liver oil were extracted. The queen olive crop for the 1942–43 season was estimated at 50,000–60,000 hogsheads; manzanilla olives at 25,000–30,000 hogsheads. In the case of almonds (1943 crop: 33,029 short tons) and raisins, there were heavy stocks on hand carried over from the previous year. Wool production for 1942 was 2,776 short tons; domestic cotton, 6,790 short tons. Total rosin and derivative oil output was 29,762 short tons.

Mineral Production.—Few figures on mineral production were available. Steel production (1942) totalled 702,392 short tons; nickel, 617 short tons. Mercury output (unoff. est. 1941) was 85,500 flasks. In addition to domestic necessities, the production of lead allowed an export of 13,228 short tons in 1942. Hard coal production, for 5 months of 1943, was 3,747,820 short tons (1942 corresponding period: 3,527,360 short tons). (*See* also WORLD WAR II.)

Spangler, Harrison E.

(1879–), U.S. lawyer and politician, was born June 10 in Guthrie county, Iowa. He was graduated from Iowa university law college and was admitted to the bar in 1905. Active in Republican party activities since his youth, Spangler worked his way up to state leadership and in 1931 became a member of the Republican national committee. He directed Alfred Landon's presidential campaign for the midwest area in 1936. After the retirement of Joseph W. Martin as chairman of the Republican national committee in 1942, Spangler was selected for the post. He was active throughout 1943 in preparation for the 1944 presidential election. On Sept. 6 Spangler opened the meeting of the Republican Post-war Advisory council at Mackinac Island, Mich.

Spanish-American Literature.

It is in the field of the novel that the literary production of Spanish America was most fortunate in the year 1943 and the name of Joaquín Edwards Bello must be placed at the head of the year's list. His book *En el viejo Almendral,* in which one renews acquaintance with the characters of *Valparaíso, la ciudad del viento,* combined the well-known Edwards realism and a melancholy and reminiscent atmosphere that fits very well with the novel's period, 1900, and its background, the speculating commercial middle classes of a port destined, due to the opening of the Panama canal, never again to be what it once had been. Edwards Bello received in 1943 the Chilean national prize for literature for the ensemble of his already long work, a fitting recognition of a successful career. As if this writer, who always seems in his works somewhat autobiographical, had set the mood for the year's production, there were several other more or less autobiographical novels: in Chile, Benedicto Chuaqui's *Memorias de un emigrante,* given the 1943 Santiago municipal prize, is the romanced autobiography of a Syrian immigrant; the Venezuelan Mariano Picón Salas also looked to the past in *Viaje al amanecer,* a remembrance of his childhood in the Andes; and the Mexican writer Agustín Yáñez, who in 1942 in *Flor de juegos antiguos* pictured a provincial Mexican infancy, in his 1943 book *Archipiélago de mujeres,* subtitled "Adolescence's ports of call," successfully presented a young man's discovery of woman. Another Mexican, José Revueltas, representing a different conception of the novel, published in 1943 a distinguished work under the title of *El luto humano.* The historical novel had not been too popular in Latin America in late years, but in 1943 Gerardo Gallegos in *Beau Dondon conquista un mundo* made an excellent attempt at it. The Chilean Reinaldo Lomboy's *Ránquil* would fit in both the historical and the social revolt types of writing. Using as basis of his plot a real life incident, Lomboy develops the tragedy of a group of farmers expelled from their land, driven to misery and rebellion and bloodily crushed by the forces of the state; occasionally Lomboy loses the thread of his story in his delight in description of landscape, and the effectiveness of his effort becomes thus somewhat diluted. One might also mention some other novels published in 1943: the Ecuadorian Demetrio Aguilera Malta's *La isla virgen,* the Mexican Diego Cañedo's *El referí cuenta nueve,* the Argentinean Abelardo

Arias' *Álamos talados,* the Colombian Eduardo Caballero Calderón's *El arte de vivir sin soñar.*

In the short story, Argentina led the field in 1943 with two books, *Como naufragó el Capitán Olssen* and *La señora Enriqueta y su ramito,* by the devoted director of the "Teatro del Pueblo" and grand writer, Leonidas Barletta. His stories are subtle and entertaining, carrying their message deep in their apparently commonplace occurrences. The Peruvian Serafín Delmar in *Los campesinos y otros condenados* described the men and the landscape of his native land as he painfully remembered them during his long term behind prison walls. The great descriptive narrator Mariano Latorre published a new book of Chilean short stories and poems entitled *Mapu.* The Cuban Lino Novás Calvo collected in a volume *La luna nona y otros cuentos* some of his fine short stories, and his compatriot Ramón Guirao gathered some Afro-Cuban folklore materials in *Cuentos y leyendas negros de Cuba.* From Central America came Juan Ulloa's *Vidas humildes, Cuentos salvadoreños.*

Poetry was in 1943 as assiduously cultivated as ever in Spanish America. In Mexico, the Honduran Don Rafael Heliodoro Valle published a book of poems, *Contigo,* which, in the words of González Martínez, is "a book of plenitude," written by a fully developed man and scholar, sensitive, sincere and profound; Efrén Hernández's *Entre apagados muros* was the appreciable first poetic work of a well-established short-story writer, and Octavio Paz in *A la orilla del mundo* gathered his poems of different years, permitting the reader to follow the evolution of one of the most promising men of the younger generation of Mexican poets. From Central America came some verse *plaquettes* of interest: for instance, the Guatemalans Raúl Leiva's *En el pecado* and Otto Raúl González's *Voz y voto del geranio.* The Colombian poet Germán Pardo García collected his poems in a book, *Sacrificio,* in which the musical quality so characteristic of his country's poetry does not fail him. In Venezuela, Otto D'Sola published *El viajero mortal,* pervaded with the author's sense of anguish before the world's agony. In Chile, the venerable Don Samuel A. Lillo published *El rio del tiempo,* verses full of the mildness of heart of a man who can look back on a very long life; in the same sentimental trend was Felix Armando Núñez's *Canciones de todos los tiempos;* in contrast, Pablo de Rokha's *Multitud* and *Morfología del espanto* expressed often violently his social and political preoccupations. Although formally written in prose, though it is a poetical prose, mention should be made of Augusto d'Halmar's *Mar, Historia de un marino y de un pino marítimo.* Argentina's Francisco Luis Bernárdez reached a new point in his poetic orbit with the publication of *Poemas de carne y hueso,* an attempt at the humanization of a poetry formerly dehumanized. To the rather hard and cold pole of purely intellectual poetry belonged some other Argentinean books: *La columna y el viento* by Vicente Barbieri, *Ángel trocado* by Elena Duncan, *Persuasión de los días* by Oliverio Girondo. Closer to the tones of emotion was *Orilla nocturna* by González Carbalho, a new maker of delicate and essential poetry, as was also Silvina Ocampo's *Enumeración de la patria,* adorned with a gift for original and rapid imagery, and Juan Burghi's *Pájaros nuestros.* Verging on archaism was Antonio Pérez Valiente de Moctezuma's *Sol en la niebla* and on symbolism, Macedonio Fernández's *Muerte es beldad.*

World War II had not found a more vigorous singer in the Spanish language than the great Chilean Pablo Neruda nor a better poem than his *Nuevo canto de amor a Stalingrado.*

For those who love the past, one should not fail to mention the appearance of a hitherto unpublished little book of poems written in his last days by Amado Nervo and which, under the title *La última luna,* was included in the Mexican review *Abside.*

In the field of essay-writing or in that of more erudite endeavours, it was stimulating to observe all over Spanish America men deeply interested in the continued search for the real meaning and significance of their countries in a world in transformation. Some approached this study from the philosophical point of view and thus are found Mexicans searching the history of Mexican thought: Samuel Ramos in *Historia de la filosofía en México,* Leopoldo Zea in *El positivismo en México.* The Chileans approached the problem historically: Norberto Pinilla in *La generación chilena de 1842;* or looked more physically to their land: Luis Durand in *Presencia de Chile;* or examined the popular manifestations of their national spirit: Pablo Garrido, in *Biografía de la cueca.*

In Cuba, the learned Don Fernando Ortíz looked into an economic event of the island's history in *La hija cubana del iluminismo.* (L. Mo.)

Spanish Colonial Empire. Total area (approx.) 128,100 sq.mi.; total population excluding Spain (est. Dec. 31, 1939) 1,005,000.

The accompanying table lists the colonies, protectorates, etc., of Spain (*q.v.*) with certain essential statistics appropriate to each of them.

Spanish Colonial Empire

Colony and Area sq.mi. (approx.)	Population Estimated Dec. 31, 1939 (000's omitted)	Capital, Status, etc.	Principal Products (in short tons)	Imports and Exports (in thousand pesetas)	Road, Rail and Shipping	Revenue and Expenditure (in thousand pesetas)

Spanish Literature. Spanish literary production in 1943 suffered from material shortages arising from war conditions. American publishing houses, particularly those of Argentina, assumed a large share of the burden of publishing the Spanish works mentioned below.

The output of novels was unusually low. Juan Antonio Zunzunegui won wide acclaim for his second novel, *El hombre que iba para estatua.* Pérez de Ayala's *Bajo el signo de Artemisa* was published in Buenos Aires; numerous reprints of the novels of Pérez Galdós anticipated the centenary of this writer's birth; and there were reprints of most of the novels of Pérez y Pérez. *Los héroes universales de la literatura española* was the work of Juan Cabal; and in *La novela picaresca en España* Valbuena Prat continued his noteworthy work as critic.

In poetry, anthologies and criticism were more abundant than original poems. Notable in the former group was Dámaso Alonso's *Poesía de la edad media.* Sustained interest in Menéndez Pelayo resulted in the reprinting of the *Antología de poetas líricos castellanos.* Rafael Alberti contributed *El poeta en la España de 1931* and Angel Battistessa studied *Poetas y prosistas españoles.* Some 300 poems of Pedro Salinas were collected in *Poesía junta,* published in 1942.

Jacinto Grau's *Unamuno y la España de su tiempo* evidenced the lasting interest in the versatile sage of Salamanca. Palacio Valdés' *Album de un viejo* was reprinted, as were essays of Pío Baroja (*Pequeños ensayos*); and F. Madrid produced a biography of Valle Inclán. Ramón de la Serna's *Mi tía Carolina Coronado* is a study of a modern poet.

The Consejo Superior de Investigaciones Científicas continued to sponsor literary and historical research. Noteworthy among the monographs appearing under its auspices were Sánchez Alonso, *Historia de la historiografía española* and Ramon Cenal, *Teoría del lenguaje de Carlos Bühler.* The Real Academia de Ciencias Morales y Políticas issued *La época del mercantilismo en Castilla,* the *discurso de recepción* of José Larraz López, onetime finance minister.

Spanish letters included the writings of a goodly company of expatriates, whose work gradually merged with the stream of Hispanic literature. Madariaga returned to fiction with *El corazón de piedra verde* and wrote a *Guía del lector del Quijote.* Jiménez de Asua contributed a volume on *Cüestiones penales de eugenesía, filosofía y política,* while Sánchez Albornoz and Ots Capdequi wrote in the field of historical-legal criticism. There were political treatises by or concerning three former presidents: Doin, *El pensamiento político de Azaña;* Aguirre, *De Guernica a New York;* and Ossorio, *Vida y sacrificio de Companys. Orígenes del frente popular* was the work of Martínez Barrio.

Proscribed in Spain, the Catalan language and literature found another refuge in the Casal Català, established in London. At Oxford, Joan Gili published an *Introductory Catalan Grammar.*

Special Libraries Association. Founded in 1909 to further the purpose of special libraries in business and industrial organizations, and to promote the collection, organization and dissemination of information in specialized fields; to develop usefulness and efficiency of special libraries and other research organizations; and to encourage the professional welfare of its members. As of Sept. 30, 1943, the association had 3,023 members in the United States, Canada and overseas. These members represent banking, advertising, insurance, finance, social welfare, publishers, newspapers, manufacturers, museums, specialized departments of colleges and universities, business branches of public libraries and technical libraries. The official journal, *Special Libraries,* is published monthly September to April, with bimonthly issues May to August. The association has 19 chapters in the U.S. and two in Canada. An annual convention is held yearly in June. The association carries on a publications program which is professional in character and is taking part in the war effort. *Special Library Resources,* vol. 1, was published in 1941 with three additional volumes planned for 1944 publication.

The 1943–44 officers were: president, Eleanor S. Cavanaugh, Standard and Poor's corporation, New York city; first vice-president, Walter Hausdorfer, School of Business, Columbia university, New York city; second vice-president, Phillips Temple, Georgetown university, Washington, D.C.; treasurer, Jean Norcross, Dun & Bradstreet, Inc., New York city; secretary and advertising manager, Kathleen B. Stebbins, 31 E. 10th st., New York city. Directors: Ford M. Pettit, the *Detroit News,* Detroit, Michigan (term expiring 1946); Herman H. Henkle, The Library of Congress, Washington, D.C. (term expiring 1944); Betty Joy Cole, Calco Chemical Division, American Cyanamid company, Bound Brook, N.J. (term expiring 1945); Laura A. Woodward, Maryland Casualty company, Baltimore, Md. (term expiring 1944).

(K. B. S.)

Spellman, Francis Joseph (1889–), archbishop of the diocese of New York, was born May 4 in Whitman, Mass. After receiving an A.B. degree from Fordham university in 1911, he studied for five years at the University of the Propaganda at Rome. On his ordination in 1916 he returned to serve in Boston. In 1925 he again went to Rome, this time to serve as an attaché in the office of the secretary of state and translator of papal broadcasts and encyclicals. He remained in this post until 1932, when he was made auxiliary bishop of Boston. In April 1939, he was appointed archbishop of New York, the wealthiest Catholic see in the world. On Dec. 11 he was named military vicar of American Catholics in the armed forces. In this capacity Archbishop Spellman started in Feb. 1943, on a six-month, 45,000-mi. aeroplane trip covering four continents. He visited the Pope, Prime Minister Churchill, and officials of a number of countries, as well as many military hospitals. The letters written to his father during this trip, relating his experiences and impressions, were published in *Collier's* magazine under the title "Action This Day."

Spelman Fund of New York was chartered in 1928. The fund, during 1943, continued its program directed at the improvement of the methods and techniques in the field of public administration. The Chairman of the Board of Trustees in 1943 was Charles E. Merriam.

(C. MH.)

Spices. Supplies decreased sharply during 1943. French Indo-China, Netherlands Indies and China, the principal producing areas, continued under enemy control, and no statistics as to imports, countries of origin, etc., were released by the U.S. government. The U.S. War Production board's Regulation M-63 as amended Aug. 7, 1943, controlled imports of black and white peppers, cinnamon, ginger, nutmegs, allspice, mace, paprika, vanilla beans, celery and sesame seeds by a permit system. To retard the disappearance of scarce items, the U.S. Food Distribution administration on July 1, 1943, ordered that deliveries

should not exceed the following percentages of 1941 totals:

Black pepper . .	Not more than 40%	Mace	Not more than 40%
Cinnamon (cassia)	Not more than 35%	Nutmegs . . .	Not more than 60%
Cloves	Not more than 90%	Pimento (allspice)	Not more than 115%
Ginger	Not more than 100%	White pepper . .	Not more than 40%

Black pepper ordinarily constitutes about 50% of the spice business. Stocks in U.S. warehouses were large in 1943, probably enough to meet consumer demand through 1945. In Feb. 1942 the Office of Price Administration imposed a ceiling price on whole black pepper of six and one-half cents per pound. Ceilings usually had been determined after officials had met representatives of different branches of an industry, but in the case of pepper, such a hearing was not held. Holders owned their pepper at a cost of eight cents or more, so the loss of one and one-half cents per lb. would exceed $510,000 on the approximate 15,360 tons (2,240 lb. each) stored in public warehouses in 1943. Trading ceased, bringing a new limitation order (see *above*) lowering the deliverable percentage from 60% to 40%.

Much pepper was imported in 1939, 1940 and 1941 as a hedge against inflation. Pepper was ideal for this purpose, as there was no import duty. Added advantages were long-keeping quality and constant domestic/export demand.

The growing of spices in the U.S. did not proceed well in 1943. There were two exceptions, mustard and hot red peppers. In the states of Washington, Montana and California there were good mustard seed harvests, estimated by the department of agriculture above 44,000,000 lb. Until a few years previously, almost all mustard seed originated in the European and Asiatic war areas. As shortages of butter, meats and oils were emphasized by the requirement of more ration points, new uses for prepared mustard appeared. Added to butter or oleomargarine, these may be stretched about 40%. Red pepper growing became profitable in the south and quality excellent. Aromatic seeds, herbs and paprika fared badly because of fantastically high production costs.

Imports of useful spice seeds and turmeric from India in 1943 were almost impossible as native prices, due to inflation, were much above U.S. ceilings.

Negotiations whereby coriander, cummin and fenugreek seeds and marjoram might again be obtained from North Africa proceeded during 1943. Evaluation of the franc in terms of the dollar was one of the problems. Little information was available to indicate when trading would be resumed with Morocco, Algeria and Tunisia. (C. A. T.)

Spruance, Raymond Amos (1886–), U.S. naval officer, was born July 3. He entered the navy in 1903 and was promoted through the ranks to rear admiral in Oct. 1940. He was assistant chief of staff to the commander of the naval forces in Europe, 1924–25, and was chief of staff and aide to the commander of a destroyer scouting force, 1933–35. After acting as commandant of the 10th naval district, San Juan, Puerto Rico, 1940–41, he returned to the office of the chief of naval operations at Washington and was sent to the Pacific theatre of operations at the outbreak of war with Japan in Dec. 1941. Adm. Spruance was in complete charge of operations during the landings of the U.S. marines on the Gilbert Islands of Makin and Tarawa, Nov. 20–23, 1943. At that time, it was also disclosed that he had been made chief of a newly created Central Pacific command.

Spykman, Nicholas John (1893–1943), U.S. educator, was born Oct. 13 in Amsterdam, the Netherlands. He attended the Universities of Delft and Cairo and received his Ph.D. degree from the University of California in 1923. In his youth, Dr. Spykman had been a journalist in the far east, and was at one time managing editor of a Netherlands Indies journal. He taught at the University of California in 1923, went to Yale in 1925 as assistant professor of international relations and became a naturalized U.S. citizen in 1928. He became chairman of the Yale department of international relations in 1935 and first director of the Yale Institute of International Studies, holding both posts until 1940. After the entrance of the United States into World War II, Dr. Spykman gave courses at the University of Virginia's special school for military administration of occupied areas. An authority on geopolitics, Dr. Spykman created controversy with his work, *America's Strategy in World Politics* (1942). He emphasized that the preservation of some balance of power was a prerequisite to the security of the western hemisphere. Dr. Spykman died in New Haven, Conn., June 26.

Squash Racquets. Although no official national championship was held in squash racquets during 1943, H. Sherman Howes of Boston was generally recognized as U.S. champion as a result of his victory in the National Red Cross championships held in New York city. Howes defeated Germain Glidden of Englewood, N.J., 7–15, 15–11, 15–12, 15–14, in the final. Glidden, a national champion in 1936, 1937 and 1938, upset Charles Brinton of Philadelphia, the 1942 titlist, in the semifinals. The veterans' championship, held as a part of the Red Cross tournament, was won by A. M. Sonnabend of Boston, who held the national veterans' title in 1938. Sonnabend defeated Bradford C. Durfee of New York city, 16–15, 15–12, 15–10, in the final of the 1943 Red Cross Veterans' meet.

The only other squash racquets event of major importance was the international test with Canada for the Lapham trophy. The Canadians regained the trophy, 8 matches to 4. John C. Holt II, of Yale, won the national intercollegiate championship, replacing Brinton who in 1942 competed for Princeton. The New York state championship was won by H. W. Pell of the Princeton club.

Squash tennis, equally hard hit with squash racquets and racquets because of the rubber shortage, also held a National Red Cross tournament to replace its official national championship. Joe Lordi of the New York Athletic club, national champion in 1941, won the Red Cross event. (M. P. W.)

Stainless Steels: *see* METALLURGY.

Stalin, Joseph Vissarionovich (1879–), Russian statesman, was born in Georgia and succeeded Lenin as virtual dictator of the soviet union in 1924 (see *Encyclopædia Britannica*). On May 6, 1941, shortly before the German invasion, Stalin assumed the premiership of the U.S.S.R. after the resignation of Vyacheslav Molotov from that office.

Throughout 1942 and 1943, Marshal Stalin repeatedly appealed to the Allies to open a second front and asserted on several occasions that Allied aid was not commensurate with Russia's con-

"THE PEACE PLANNERS." The best-laid schemes of U.S. postwar planners would go awry without the assent of Joseph Stalin, pointed out Darling of the *New York Herald Tribune* in 1943 prior to the pacts of Moscow and Tehran

tribution in engaging the greater bulk of the nazi army. It was believed, however, that most of Stalin's suspicions regarding Anglo-U.S. motives were dissolved after the Tehran conference in the last days of Nov. 1943. At this historic parley, Stalin and Roosevelt met for the first time, Stalin and Churchill for the second. The three United Nations chiefs agreed on a master plan to destroy the German military power. The subsequent appointment of Gen. Dwight D. Eisenhower as invasion commander allayed Russian apprehension over the second front. (*See* also UNION OF SOVIET SOCIALIST REPUBLICS.)

Stamp Collecting: *see* PHILATELY.

Standards, National Bureau of.

The national bureau of standards, established by act of congress March 3, 1901, was made up in 1943 of nine scientific and technical divisions, three divisions dealing with commercial standardization, and a special division set up as a war measure, and concerned wholly with military problems. The regular divisions are the following: electricity, weights and measures, heat and power, optics, chemistry, mechanics and sound, organic and fibrous materials, metallurgy, clay and silicate products, simplified practice, trade standards and codes and specifications. On June 30, 1943, the bureau staff consisted of 2,263 employees and 51 research associates. The regular appropriation for the fiscal year was $2,440,200. In addition, $304,100 was made available in deficiency items.

The war affected all the bureau's activities. An increasing proportion of the personnel and of laboratory facilities were transferred to war projects until it was estimated that 90% were so employed. However, certain normal activities proved fully as useful in war time as in peace. This was true, for instance, of the standard frequency radio broadcasts which were extended and improved, largely for the benefit of the military services. The testing of weighing and measuring equipment increased greatly; 30,000 master length gauges, and 32,000 pieces of glass volumetric apparatus were measured and certified. The scarcity of many engineering and construction materials was reflected in the problems submitted to the bureau. Substitutes for metals were being sought in wood, concrete and plastics. Buildings erected at the bureau were fabricated from concrete and wood, using very little steel.

The bureau demonstrated that often a scarce metal can be replaced by one not so high on the priorities list, possibly treated in some way to give it special properties for the work in hand. An example was the development of exhaust pipes for aeroplane engines, made of steel coated with vitreous enamel to replace the scarce stainless steels. The necessity of conserving fuel oil was the cause of many tests of "conversion grates" intended to make possible the use of coal in oil-burning heating boilers. A few of these were found to have real possibilities.

The complete elimination of the usual sources of jewel bearings for electrical and other instruments resulted in a synthetic sapphire industry in the United States. The bureau aided manufacturers in overcoming many problems, and one company alone was producing more than 2,000,000 carats of spinel and sapphires a month. Crystalline quartz for the manufacture of oscillators was tested in large quantities; 500,000 pounds were inspected during June 1943. Supplementing this work, a research project was started to insure maximum utilization of all grades of crystals. The number of standard samples of pure substances (used as controls in industrial laboratories) ordered during 1943 was 24,000; more than 150 standards were available.

A new publication on the physical properties of metals and alloys was prepared to replace a circular issued in 1924 and still in demand. It was of great value to engineers forced to use unfamiliar construction materials during the emergency.

Many determinations of the properties of synthetic rubbers were made, and samples of articles manufactured from these materials were tested. The bureau developed standard test procedures by which to evaluate the products of the newly built synthetic rubber plants, so that full utilization of every grade of material would be insured. In the course of the bureau's work on plastic windows and enclosures for aircraft, it was shown that a common constituent of sun-tan lotions, when incorporated in the plastic, would greatly reduce deterioration from the ultraviolet rays in sunlight and protect the plane's crew from sunburn. Certain alkaline methods were found feasible for treating low-grade bauxites and common clays in order to recover alumina of sufficient purity to meet the rigid requirements of the aluminum industry. At the bureau's branch laboratories more than 18,000,000 barrels of cement were tested for use on government construction projects.

The War Production board and the Office of Price Administration requested the bureau's assistance in developing simplification programs intended to conserve materials and manpower. The bureau was associated with WPB in the development of 130 limitation and 25 conservation orders. Twenty-one Commercial Standards were translated into Spanish and Portuguese. An important standard affecting domestic business covered the retreading of automobile tires.

Four circulars on elevator maintenance during the war period were prepared by a special committee and published by the bureau. Other results of the year's work appeared in 222 papers by members of the staff—152 in the bureau's own series and 70 in scientific and technical journals. (L. J. BR.)

Standley, William Harrison (1872–), U.S. naval officer and diplomat, was born Dec. 18 at Ulciah, Calif. He was graduated from the U.S. Naval academy, 1895, was commissioned an ensign, saw service in the Spanish-American war, and was a naval captain during World War I. He was raised to the rank of rear admiral in 1927, was assistant chief of naval operations, 1928–30, commander of destroyer squadrons, 1930–31 and commander of a cruiser division with the rank of vice-admiral, 1931–33. He was commander of a battle force in 1933, ranking as an admiral, and was chief of naval operations, 1937–38. Although he retired with the rank of rear admiral, 1937, he was recalled to active duty in March 1941. In the fall of 1941, he served as a member of a mission to the U.S.S.R. to confer with British and Russian officials on means of speeding aid to the U.S.S.R. He was appointed ambassador to Moscow, Feb. 9, 1942. While Adm. Standley was favourably impressed with the Russians, he nevertheless criticized their failure to publicize the amount of aid they were receiving from the U.S. As a result, soviet newspapers devoted more space to the quantity of U.S. war materials sent to the U.S.S.R. Adm. Standley returned to Washington in late September and his resignation as ambassador was announced Oct. 1.

Stanford University (THE LELAND STANFORD JUNIOR UNIVERSITY), an institution of higher education near Palo Alto, Calif.

On Sept. 1, 1943, Dr. Donald Bertrand Tresidder took office as president of the university, succeeding Dr. Ray Lyman Wilbur, who no longer was an administrative officer but remained as chancellor. Gifts amounting to $1,000,000 were received during the fiscal year ending Aug. 31, 1943. On May 7–8, the first annual conference was held under the auspices of the school of humanities on "The Humanities Look Ahead." By autumn the university's facilities were taxed to the utmost to handle, in addition to the civilian students, 3,000 soldier students under the army specialized training program and the civil affairs training school —with units in medicine (including premedical), basic and advanced engineering, personnel psychology, quartermaster corps, foreign area and language studies (European and Asiatic), and Women's Army corps (for physiotherapy aides). Appointments of professors in geography and anthropology were made to work on these war programs. Aside from improvements in buildings for housing and boarding students no structural changes were made. For the duration of the war all fraternity houses were taken over as part of the dormitory system and named after the presidents of the United States. Intercollegiate athletics were eliminated in accordance with the army program. With the pressures of war there came the continuous session, newer methods of teaching languages, and other changes in courses that seemed likely to have a permanent effect on higher education at Stanford. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (R. L. W.)

Stanley, Oliver Frederick George (1896–), British politician, and the son of the 17th earl of Derby, was educated at Eton and Oxford. As an artillery major, he served with distinction in World War I and was awarded the military cross and the croix de guerre. After the armistice, he was admitted to the bar, 1919. Stanley, who held cabinet posts in the MacDonald, Baldwin, Chamberlain and Churchill governments, was parliamentary undersecretary to the home office, 1931–33, minister of transport, 1933–34, minister of labour, 1934–35, president of the board of education, 1935–37, and president of the board of trade, 1937–40. In 1940, Chamberlain named him secretary of state for war, but he was dropped by Churchill when the latter became prime minister in May 1940. In Nov. 1942, Churchill reshuffled his government and Stanley returned to the cabinet as colonial secretary. In March 1943, he was the object of some criticism from liberal elements in England and the U.S. for his statement rejecting any kind of scheme of international administration of British colonies after the war. His views on this subject were identical with those of Churchill.

Stark, Harold Raynsford (1880–), U.S. naval officer, was born at Wilkes-Barre, Pa., on Nov. 12. Graduated from the U.S. Naval academy in 1903, he was commissioned ensign two years later and served on various ships and at various naval stations from 1903 to 1917. During World War I he was on the staff of Admiral William S. Sims, commander of the U.S. naval forces in European waters. On March 15, 1939, he was appointed chief of naval operations with the rank of admiral. He was persistent and successful in his pleas to congress for a larger fleet, making possible a two-ocean navy. On March 9, 1942, Admiral Ernest J. King, commander in chief of the U.S. fleet, became chief of naval operations and Stark was made commander of U.S. naval forces in European waters, the same position that Admiral Sims had held in World War I. As such, he was liaison officer between the British admiralty and Washington. In the summer of 1943 he rendered outstanding diplomatic service in his negotiations with Gen. Charles de Gaulle and the French Committee of National Liberation. With de Gaulle's assistance, Stark was able to obtain the co-operation of French officials, both civil and military, with U.S. armed forces in New Caledonia and New Hebrides. He also negotiated mutual lend-lease arrangements between the Free French and the U.S. which gave to the U.S. essential supplies from New Caledonia, Madagascar, Africa and other French colonies in return for assistance to French forces in the Pacific theatre. Stark had much to do with the agreement achieved in 1943 by Generals de Gaulle and Giraud.

Steagall, Henry Bascom (1873–1943), U.S. politician, was born May 19 in Clopton, Dale county, Alabama. He graduated from the University of Alabama in 1893, and held a number of political offices in the state. He was elected to the U.S. congress in 1915 as representative from the 3rd Alabama district and was re-elected 13 consecutive times. Steagall was influential in the house during the closing days of the Hoover administration and throughout the first 10 years of the Roosevelt presidency. As chairman of the house banking and currency committee, many important financial measures passed through his hands. He was co-author of the Glass-Steagall emergency banking bill for expanding credit and the Glass-Steagall banking reform act, and was leader of the house's powerful farm bloc. He died in Washington, Nov. 22.

Stein, Sir Aurel (1862–1943), British archaeologist, was born Nov. 26 in Budapest. During his more than 30 years of research in remote parts of Asia, he uncovered a wealth of material on ancient civilizations which he recorded in books and a score of technical papers. His last publi-

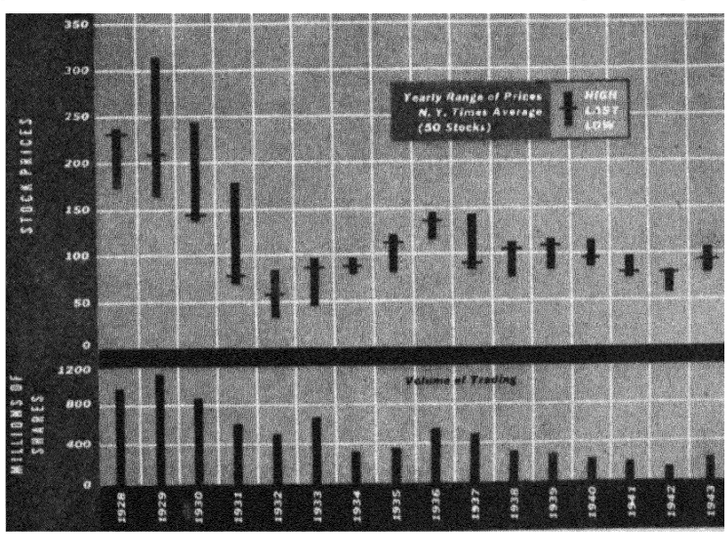
cation, *On Old Routes of Western Iran,* appeared in 1940. Sir Aurel died in Kabul, Afghanistan, Oct. 28. (See *Encyclopædia Britannica.*)

Stellar System: *see* ASTRONOMY.

Stettinius, Edward R., Jr. (1900–), U.S. businessman and statesman, was born in Chicago Oct. 22, son of Edward R. Stettinius, partner in the firm of J. P. Morgan and company. He studied at the University of Virginia, but left to enter the employ of General Motors in 1924. In 1931 he became a vice-president of that corporation. In 1934 he resigned from General Motors to become vice-chairman of the finance committee of the U.S. Steel corporation; two years later he became chairman of the committee and a director of the corporation, and in 1938 he was made chairman of the board. In May 1940, he was appointed a member of the advisory commission to the Council of National Defense, and a few days later he resigned all his offices with the U.S. Steel corporation. This was not his first connection with the federal government, for in the latter half of 1933 he had been liaison officer between the NRA and the industrial advisory board of the NRA, and in 1939 he had been made chairman of the War Resources board. From Jan. to Aug. 1941, he served as chairman of the priorities board and director of the priorities division of the OPM. On Aug. 28, following the resignation of Harry L. Hopkins, Stettinius was appointed lend-lease administrator.

He remained in this post until Sept. 25, 1943, when Pres. Roosevelt named him to succeed Sumner Welles as undersecretary of state.

Stilwell, Joseph W. (1883–), U.S. army officer, was born March 19 at Palatka, Fla. He was graduated from West Point, 1904, and served with the A.E.F. in France during World War I. After the armistice, he studied Chinese at the University of California, spent three years at Peiping mastering several Chinese dialects and served as military attaché in China, 1932–39. After Pearl Harbor, he was promoted to lieutenant general, Feb. 1942. He served a month as General Chiang Kai-shek's chief of staff and in March 1942 Chiang gave him command of the 5th and 6th Chinese armies fighting the Japanese invading Burma. Beaten by stronger and better-equipped Japanese, Stilwell retreated toward India. After the fall of Burma in May 1942, Stilwell led a group of 400 refugees through 140 mi. of jungles and mountains to safety in India; the trip took them 20 days. After turning up at Allied headquarters in New Delhi, Stilwell said: "I claim we got a hell of a beating. We got run out of Burma and it was humiliating as hell. I think we ought to find out what caused it, go back and retake it." During 1943, as U.S. commander in southeastern Asia under Lord Louis Mountbatten, he was busy preparing to do so.



Stimson, Frederic Jesup (1855–1943), U.S. diplomat and legal scholar, was born July 20 at Dedham, Mass. He studied law at Harvard university, graduating in 1878, and held a number of political posts in Massachusetts. He was professor of comparative legislation at Harvard, 1903–14. In 1914, Stimson was named U.S. ambassador to Argentina, a post he held until 1921, and he was also special ambassador to Brazil, 1919. Among his works are: *The Law of the Constitutions, State and Federal* (1907), *Popular Law-Making* (1910), *The American Constitution, As It Protects Private Rights* (1923), *The New Deal under the Constitution* (1936), and *Critique of Pure Science* (1938). He died at Dedham, Nov. 19.

Stimson, Henry Lewis (1867–), U.S. statesman, of whom a biographical sketch appears in *Encyclopædia Britannica.* A Republican, he became an ardent admirer of Cordell Hull's policies as secretary of state (the office Stimson had held in Pres. Hoover's cabinet) and was always quick to defend Hull's actions against criticism. He favoured in particular a strong stand for the United States against Japan, Germany and Italy. Pres. Roosevelt appointed him secretary of war on June 20, 1940. Like his fellow cabinet-member, Frank Knox, Stimson favoured a militant foreign policy in 1940 and 1941. Stimson continued to direct an ever-expanding program in 1942 and 1943. One of his last official acts of the latter year was to take control of the railroads on Dec. 27, when strikes threatened.

Stock Exchanges: *see* STOCKS AND BONDS.

Stocks and Bonds. **Stocks.**—Although U.S. stock market price movements for 1943 were somewhat more extensive than during 1942, the extent of the fluctuations was comparatively small considering the extraordinary economic events of a domestic and international character. Except momentarily, the market as a whole seemed unaffected by war events, the imposition of increased taxes or the effects of rationing and control systems. Probably most of the war events of 1943 and their accompanying economic effects were anticipated and largely discounted by the market. Throughout 1943 the average price level of stocks remained extremely low, in view of large corporate earnings and dividend distributions, a situation strongly incompatible with the large amount of talk concerning the prospects of inflation, as well as the huge postwar activity to meet depleted backlogs of needed goods, repairs and new construction. In fact, the most noticeable feature concerning stock market movements during the last half of the year was the drooping tendency of the market periodically whenever talk of peace or exceptionally favourable military events figured heavily in the press. Moreover, throughout the year the market was unusually sluggish as regards the volume of transactions. For all of the leading groups of stocks, the average price level rose gradually from January to July and thereafter showed a slight decline to the end of the year.

Using the Standard & Poor's barometric figures (average for each month based on daily closing prices) the average monthly price of 20 representative railroad stocks stood at 30.2 for Jan.

*Copper and Brass figures use 1935–1939 as a base period. All other figures use 1926 as a base period.
The above figures are an average for the month based on daily closing prices, except for Copper and Brass, which are weekly prices.
(Source of data—Standard & Poor's *Trade and Securities, Current Statistics.*)

1943, as compared with 28.2 and 28.1 for December and January of 1942. Thereafter a gradual rise occurred until May and July, when for each of those months the monthly average stood at 39.4. The gradual nature of the rise for railroad shares is indicated by the monthly averages of 31.6 for February, 35.1 for March, 37.7 for April, 39.4 for May, 38.3 for June and 39.4 for July. Following July, the monthly average declined slightly to 36.7 for August, 37.3 for September and 37.6 for October. The monthly average increased by 30.5% from January to July, and subsequently declined by 4.8% during the next three months.

In the field of industrial stocks, using Standard & Poor's average for 50 leading issues, the average monthly price stood at 101.8 for Jan. 1943, as compared with 96.5 and 89.2 for December and January of 1942. From January to July of 1943, this monthly average rose from 101.8 to 122.5, or an increase of 20.2%. Following July, the average monthly price level declined slightly to 117.3 in October, or by 4.2%.

Similar price movements by months occurred in the public utility and copper and brass groups of stocks. For 20 public utility stocks, the Jan. 1943 average stood at 38.2, as compared with 34.9 and 35.4 for December and January of 1942. Following Jan. 1943, the average monthly price increased from 38.2 to 51.4 for July, an increase of 34.5%. Thereafter the price declined inappreciably to 49.9 for August and was 51.3 for September and 51.0 for October. The copper and brass stocks monthly average price stood at 75.2 for Jan. 1943 as compared with 71 6 and 88.3 for December and January of 1942. By April 1943 this average stood at 85.8, the highest monthly average for the year. Following April, a moderate decline occurred, namely, to 77.4 for October.

Combining all of the aforementioned groups of stocks (90 representative shares), the market showed an increase from 80.2 for January to 98.1 for July, or more than 22%. Subsequently, the price level declined from 98.1 to 94.3 for October, or by 3.8%.

On Jan. 1, 1943, the market value of all listed shares on the New York Stock exchange stood at $38,016,706,000, with an average market price per share of $26.39. On Dec. 1, 1943, this market value stood at $45,101,778,943, with an average market price of $32.44. An appreciation in value of approximately 18.7% was thus shown for the year.

Number, Volume and Amount of Stocks.—According to the New York Stock exchange's compilation, the total of stocks listed on that exchange on Dec. 1, 1943, stood at 1,486,877,195 shares, with a total market value of $45,101,778,943. This value com-

Total shares traded on the New York Stock exchange during 1943 amounted to 274,039,185 (up to Dec. 27), as compared with 125,677,963 during 1942; 170,534,363 during 1941; 207,605,359 during 1940; 262,015,799 during 1939; and 1,124,991,000 during 1929, the largest total on record. The 1943 market, as was also the case in 1942, was relatively stagnant, although total sales were more than double those of 1942. March was the largest month on the New York Stock exchange in 1943, with 36,997,000 shares, while October was the smallest, with only 13,923,000 shares. The New York Curb market had sales during 1943 of 70,228,763 shares (up to Dec. 27), as compared with 22,327,822 shares during 1942 and 34,690,900 shares during 1941.

Bonds.—Using the Standard & Poor's barometer figure for composite bonds (average for each month based on daily closing prices), the average high price stood at 106.4 for Jan. 1943 and 107.4 for February. Thereafter, for the rest of the year, the monthly high average price varied between 111.3 for July and October and 106.4 for January. Moreover, the monthly fluctuation between high and low was very meagre. Only during January was there a range between high and low as great as 1.90 points.

The yearly price movement thus showed a remarkably stable bond market during 1943, and an exceedingly high price level. According to the New York Stock exchange's record, bond and note flotations of United States corporations during the first 10 months of 1943 totalled only $792,618,000; but exclusive of refunding issues, investment trusts and holding companies, the total flotation amounted to only $242,605,000. Both of these figures were substantially similar to the small totals of 1942.

Number, Volume and Amount of Bonds.—According to the New York Stock exchange's compilation, the total par value of bonds listed on that exchange at the beginning of Nov. 1943 stood at $91,003,712,000, with a market value of $90,501,769,000. These figures compared with $67,155,675,000 and $64,543,971,000, respectively, for Dec. 1942. The increase in the par value of bonds during 1943 was largely attributable to the issue of large amounts of new United States government securities. Of 1943's total, United States corporation bonds amounted to (at the beginning of November) $16,603,934,000 par value, with a market value of $14,366,125,000; company bonds of other countries with

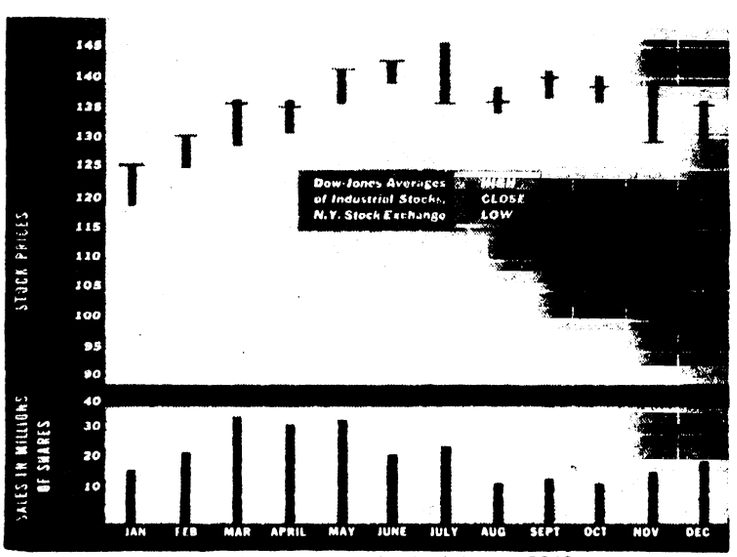
a par value of $828,604,000 and a market value of $744,491,000; United States government bonds (inclusive of corporations and subdivisions) with a par value of $71,518,751,000 and a market value of $74,060,154,000; and other governments (inclusive of subdivisions) with a par value of $2,052,423,000 and a market value of $1,330,999,000. The total listed bonds of United States corporations were distributed over 824 issues with 442 issuers; of United States government bonds with 83 issues and 5 issuers; and other governments with 157 issues and 52 issuers. Total bonds traded on the New York Stock exchange during 1943 amounted to $3,207,300,425 (up to Dec. 27), as compared with $2,182,625,800 during 1942, $2,114,098,550 during 1941, and $1,671,598,875 during 1940.

Stock Exchanges.—Important changes made by the New York Stock exchange in its rules and practices during 1943 were comparatively few. The most important changes may be grouped under the following five headings:

Merchandising of Securities.—On April 1, 1943, the special committee on merchandising of blocks of securities recommended to the board of governors of the exchange, which approved the report, a "continuation of the Exchange's policy to supplement the auction market, when necessary, by authorizing special offerings and secondary distributions of securities and to discuss with the SEC certain changes that would bring special offerings more closely into conformity with secondary distributions." Again, on June 18, the board of governors adopted amendments to the rules to permit dealings in securities on a "when distributed" basis, under certain prescribed conditions. The first instance was reported to have attended the distribution of nearly 2,000,000 shares of Public Service of New Jersey common stock by the United Gas Improvement company under the Public Utility Holding Company act.

A "special offering method of trading" was first approved on a temporary basis on Feb. 16, 1942. On July 2, 1943, the board of governors amended the rules governing special offerings and made this method of distribution a permanent adjunct of the auction market by the SEC. The amendment included "permission to over-allot up to 10% and to include in offering stock acquired in stabilization during offering; prohibiting members from receiving any part of the special commission for any purchase; elimination of requirement to reconfirm on account statements essential details of offering; to make more specific disclosure to customers; to simplify information requirements in application for special offering permission; to provide 15-minute effective period and require Exchange approval for termination of uncompleted offering and removal of three-hour time limit."

Transfer Taxes and Commissions.—The state of New York, on April 20, 1943, adopted legislation eliminating the requirement that brokers affix tax stamps to transferred securities. Instead, registered stock exchanges or affiliated clearing corporations were authorized to collect the tax, thus relieving brokers of the necessity of maintaining large stocks of stamps, paid for in advance. Similarly, on Oct. 15, the federal department of internal revenue amended its regulation respecting documentary stamp taxes, effective Nov. 1, so that the payment of federal transfer taxes would be made by the Stock Clearing corporation, instead of by the use of stamps by each member firm. On Nov. 23, the New York exchange appeared before the Senate Committee on Banking and Currency and the House Committee on Interstate and Foreign Commerce, in support of an amendment to eliminate the payment of the registration fee on dealings in government securities on national securities exchanges. Both committees approved the legislation.



For a number of years the annual financial report of the New York Stock exchange and affiliated companies had shown a considerable loss. To strengthen its financial position, the constitution of the exchange was amended to read: "when receipts from the stock exchange charge of 1% on members' net commissions, received and retained by members and member firms on transactions effected on the exchange, exceed $500,000 in any year, the rate will be reduced to ½ of 1%, and the charge will be discontinued for the remainder of the year when $750,000 has been received." On June 3, 1943 the board of governors approved an amendment to the constitution removing the aforementioned restrictions on total receipts from the 1% assessment charge.

Renegotiation Contracts of Listed Corporations.—On May 5, 1943, and again on July 28, the presidents of listed corporations were advised by the New York exchange that upon completion of any renegotiation proceedings, they should report to stockholders any effect that the settlements might have on the operating figures.

Regulations with Respect to War Loans.—Announcement was made by the New York exchange, on Sept. 15, 1943, that "for a period of fifteen days after Third War Loan Bonds are delivered to subscribers, no member firm may carry them on margin unless the customer (1) agrees to pay off the debit balance against such bonds within six months or less and (2) does not contemplate selling the security prior to full payment." Mention should also be made of the exchange's special advertising campaign of the Third War loan.

Other Actions.—Five such actions of 1943 deserve special mention, namely: (1) The amendment of the general margin rule of the exchange to the effect that "on and after April 1 purchases of securities selling below 5 may only be made on a cash basis." (2) The amendment by the SEC of the short sales rule so that "in determining the price at which a short sale may be effected in a security that has gone ex-dividend, ex-right or ex-any other distribution, all sale prices for the security prior to the 'ex' date may be reduced by the value of the distribution." (3) Disapproval, on June 18, in answer to a special poll, of the plan to admit corporations as members of the exchange. The canvass disclosed that 67% of members of the exchange and 76% of member firms registered such disapproval. (4) The suggestion by the New York exchange, on Oct. 14, to presidents of listed corporations "that stock dividends received not be recorded as income and that stockholders be notified of the amount of earnings or earned surplus capitalized by stock dividends when issued by a corporation." (5) Announcement of the exchange, on Dec. 2, that "to enlarge the usefulness of the Exchange, studies and preliminary research had been initiated looking toward the development of plans for mobilization of private capital to aid in world reconstruction after the war is won." (*See* also BUSINESS REVIEW.) (S. S. H.)

Stoessel, Albert Frederic (1894–1943), U.S. conductor, composer and violinist, was born Oct. 11 in St. Louis, Mo. Widely known as a teacher, Mr. Stoessel headed the New York university music department, 1923–30, and was a faculty member of the Juillard Graduate school, 1930–43. He was also music director of the Chautauqua Symphony orchestra, 1920–43, and conductor of the Oratorio Society of New York, 1921–43. He directed the Worcester festival, 1925, and the Westchester County Musical festival, 1927–33. His compositions include *Suite Antique, Cyrano de Bergerac, A Festival Fanfare, Hispania Suite, Concerto Grosso* and an opera, *Garrick* (1936). He collapsed on the stage of the American Academy of Arts and Letters in New York city, May 12, while conducting an orchestra at the annual ceremony of the academy and the National Institute of Arts and Letters, and died shortly afterwards. (See *Encyclopædia Britannica.*)

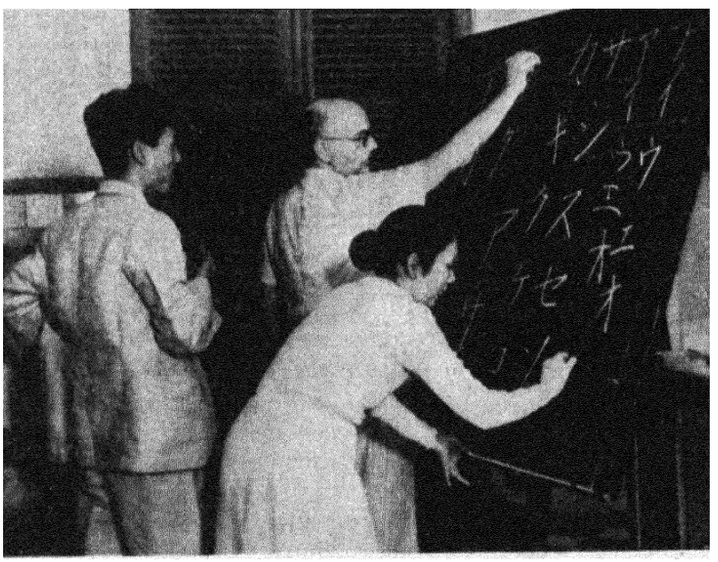
Stone. The following table lists the production of the various types of stone in the United States, so far as data were available at the close of 1943.

Production of Stone in the United States



(In thousands of short tons or thousands of dollars)

Name of Stone	1942			1941		
	Dimension	Crushed	Total	Dimension	Crushed	Total
Basalt	13	17,613	17,626	10	17,927	17,937
Granite	522	13,543	14,064	782	13,517	14,299
Limestone	463	142,025	142,488	814	132,350	133,164
Marble	49	121	170	69	107	176
Sandstone	233	6,468	6,701	183	7,409	9,592
Others	68	14,766	14,835	89	9,851	9,940
Total	1,347	194,537	195,884	1,947	181,101	183,108
Value	$16,702	$188,300	$205,002	$21,396	$173,942	$195,338

Dimension Stone.—Sales of dimension stone in 1942 were 31% less in quantity than in 1941, but only 22% less in value. Building construction used 76% of the total, with small percentages going to monumental work (marble and granite only), paving, curbing and flagging. In addition to the stone listed above, 107,030 tons of slate were sold as dimension stone in 1942.

Crushed Stone.—Sales of crushed stone in 1942 increased 7% over 1941, while value increased 8%; this does not include 47,657,000 tons of crushed limestone used in the production of cement, 12,208,000 tons used in making lime, or 483,740 tons of crushed slate. Concrete and road metal took 55% of the total, metallurgical and refractory uses 17%, agricultural uses 7% (all limestone), and railroad ballast 9%. (G. A. Ro.)

Straits Settlements. A British crown colony, under Japanese occupation Feb. 1942, one of the three principal administrative divisions of British Malaya, the others being the Federated and Unfederated Malay States

SCHOOL FOR SINGAPORE RESIDENTS in which they are required to learn the Japanese language. This photograph was released by the Japanese to neutral sources in 1943

(*qq.v.*). Area of Straits Settlements, 1,356 sq.mi.; pop. (1941) 1,435,895, divided racially as follows: Europeans 18,101, Malays 315,629, Eurasians 13,540, Chinese 927,003, Indians 148,851, others 12,771. The capital is Singapore and the large population, in relation to area, of the Straits Settlements is explained by the fact that it includes the two largest cities and trading centres of British Malaya, Singapore and Penang, the latter located on an island off the west coast of the Malay peninsula. The Japanese changed the name of Singapore to Shonan (Light of the South) and carried out propaganda among Indian prisoners of war and among the local Indian population with a view to organizing a "fifth column" Indian army under the direction of the pro-axis Indian nationalist leader, Subhas Chandra Bose.

Education, Finance, Communication.—There were 420 schools, with 83,078 students and pupils, in 1940. The unit of currency before the Japanese occupation was the Straits dollar, equivalent to 47.51 U.S. cents in 1941. The pound sterling was often used in financial estimates. Revenue in 1941 was £5,501,790 and expenditure £7,056,729. At the end of 1940 there were 1,073 mi. of metalled roads and 133 mi. of gravelled roads in the colony.

There were radio broadcasting stations at Singapore and for Penang in Province Wellesley. (W. H. CH.)

Strategic Mineral Supplies. As 1943 ended there were in the U.S. some metals, formerly short in supply, that shifted to a position of adequacy for essential demands, or to a moderate surplus. Furthermore, this position was made all the more secure by the fact that none of these shifts was announced merely on the basis of a current balance between supply and essential demands, but only after there was accumulated a surplus stock sufficient to cover the demands for six months or more.

The periodical "Material Substitution and Supply List" of the War Production board classified the essential material under these three groups:

I. Those insufficient in supply to meet war and essential industrial demands.
II. Those with approximate balance between supply and demand.
III. Those with an excess of supply over demand.

During the latter half of 1943, the following shifts were made in the classification of metal and mineral products, the list being confined to raw materials only, and not including any semi-manufactured materials in which a shortage was created by lack of processing plants or equipment, rather than by shortage of the primary raw material.

From Group I to Group II: Aluminum, chromium, magnesium, molybdenum, tungsten, vanadium, zinc, cryolite, graphite, mica and spodumene.

From Group I to Group III: Cobalt and talc.

From Group II to Group III: Calcium, mercury, palladium, titanium, zirconium and vermiculite.

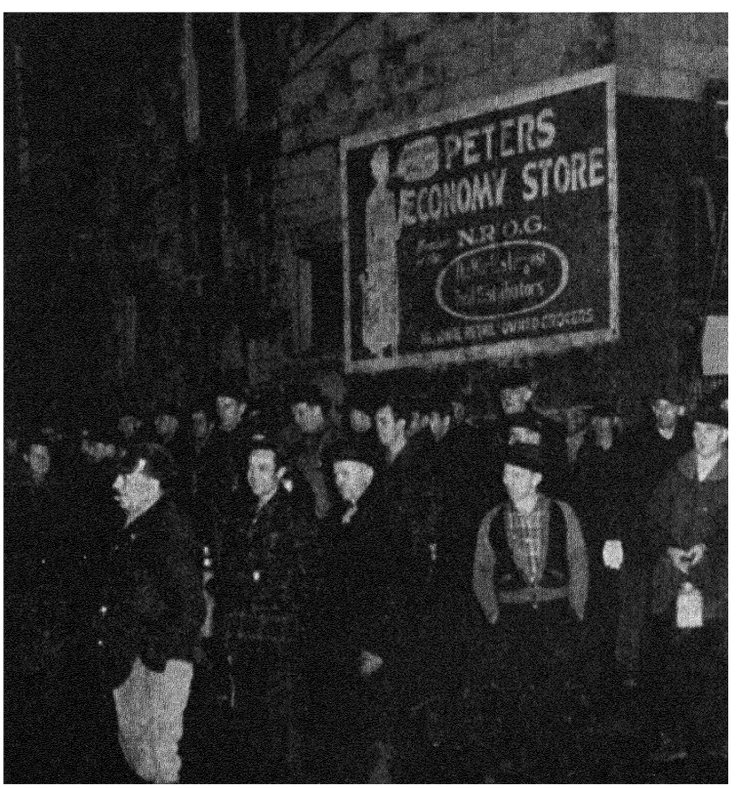
On the other hand, it was found necessary to shift columbium, platinum and natural gas from Group II to Group I, and coal and petroleum from Group III to Group II.

Metals remaining classified in Group I through the year were arsenic, beryllium, bismuth, cadmium, copper, nickel, tantalum, tin, high-grade asbestos, high-grade bauxite, low-grade chromite, corundum, fluorspar, fuel oil, gasoline, nitrates and quartz crystals.

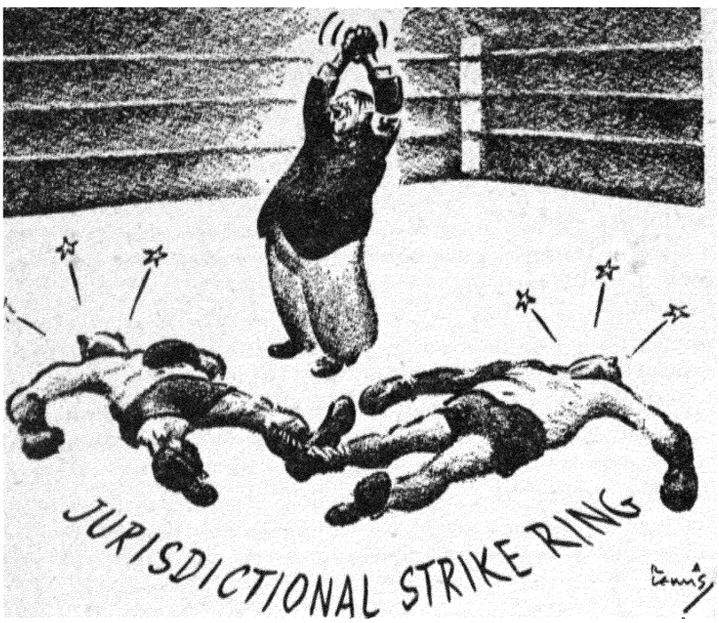
The improvements in supply outlined above were in many cases sufficient to permit the relaxation of control methods, and in others complete removal of control. Prospects promised continued improvement in the supply situation of other metals in 1944, and material increases in the amounts available for civilian supplies. (G. A. Ro.)

Stratton, Dorothy Constance (1899–), U.S. coast guard officer, was born in Brookfield, Mo., March 24. Beginning as a teacher of history in Brookfield, she became (1924) vice-principal and dean of girls at the San Bernardino, Calif., senior high school. In 1933 she joined the faculty of Purdue university as associate professor of psychology and dean of women; in 1940 she was made a full professor. During her incumbency she was instrumental in securing improvements for women students, including the establishment of residence halls and an employment service. In the summer of 1942, after helping to select one of the first groups of recruits for the Women's Army Auxiliary corps, she joined the Women's Naval reserve (WAVES) as a lieutenant. In September she became assistant to the commanding officer at the training centre for radio operators at Madison, Wis. When the Women's Reserve of the coast guard was created, Lieut. Stratton was selected to head the new unit and was promoted to the rank of lieutenant commander. She was sworn in on Nov. 24, 1942. The nickname SPARS, officially accepted as a designation for this unit, was coined by Lieut. Com. Stratton.

Lieut. Com. Stratton wrote *Problems of Students in a Graduate School of Education* (1933) and was co-author of *Your Best Foot Forward* (1940).



Streeter, Ruth Cheney (1895–), officer of U.S. Marine Corps Women's reserve, was born Oct. 2 in Brookline, Mass. Educated in Boston and Paris schools and Bryn Mawr college, she married Thomas Winthrop Streeter, lawyer, in 1917 and settled in Morristown, N.J. Mrs. Streeter became increasingly active in state and local affairs, serving on a number of welfare boards. As World War II approached, her interests turned toward national defense. In 1941–42 she was a member of the aviation committee of the New Jersey Defense council, and in 1942–43 she was an adjutant in the Civil Air patrol, having obtained her private pilot's license in 1940 and her commercial pilot's license in 1942. In 1942–43 she was also chairman of the Citizens' Committee for Army and Navy, Inc., for Fort Dix. When the women's reserve of the marine corps was organized early in 1943, Mrs. Streeter was chosen as director, and in February she was inducted with the rank of major. Together with her mother, Mrs. W. H. Schofield, Major Streeter was the donor of the Cheney award given to army aviators for "unusual valour and self-sacrifice" in memory of a brother killed in World War I.



Strikes and Lock-outs. The United States, Canada and Great Britain published, for many years, current statistics of strikes and lock-outs, their causes and results, together with detailed reports upon the more important strikes of each year. In 1943, the strike information gathered by these countries was much less complete, because of war conditions. Most of the other nations' reports are less complete and less accurate.

The Canadian department of labour published a report on strikes throughout the world in the *Labour Gazette,* March 1937.

The political situation in Germany, Italy, Russia and Japan made it "inadvisable" for wage earners to undertake strikes during recent years. World War II added Czechoslovakia, Poland, France, Norway, Denmark, the Low Countries, Bulgaria, Ru-

ANTHRACITE MINERS loitering near a Pennsylvania colliery entrance in Jan. 1943 after striking against John L. Lewis' demand for increased dues to the United Mine Workers union. President Roosevelt intervened Jan. 19 and ordered the miners back to work

"LADIES AND GENTLEMEN—THE WINNAH." This cartoon by Lewis in the *Milwaukee Journal* appeared shortly after John L. Lewis called a national coal strike April 30, 1943

mania, Greece, Finland, to the area in which strikes would be ruthlessly suppressed.

Table I.—*United States: Number of Strikes, Workers Involved and Man-days Lost, 1935-1942

Monthly Labor Review, United States Bureau of Labor Statistics (May 1943)

Year	Number of Strikes Beginning in Year Indicated	Workers Involved in Strikes Beginning in Year	Man-days Idle During Year
1935	2,014	1,117,213	15,456,437
1936	2,172	788,648	13,901,956
1937	4,740	1,860,621	28,424,857
1938	2,772	688,376	9,148,273
1939	2,613	1,170,962	17,812,210
1940	2,508	576,988	6,700,872
1941	4,228	2,302,620	23,047,556
1942	2,968	839,961	4,182,557

*Strikes involving fewer than 6 workers or lasting less than 1 day are not included in this table nor in the following tables. Notices or leads regarding strikes are obtained by the Bureau from more than 650 daily papers, labour papers, and trade journals, as well as from all government labour boards. Letters were written to representatives of parties in the disputes asking for detailed and authentic information. Since answers to some of these letters had not been received, the figures given for the late months are not final.

Table II.—*United States: War Industries' Strikes, 1942 Compared by Months, Also All Strikes, Jan.-June 1943

Compiled from *The Monthly Labor Review*, U.S. Bureau of Labor Statistics.
*Strikes affecting war work not separately compiled after Dec. 1942. Monthly strike statistics suspended, because of budgetary necessity, after June 1943. Only Oct. 1943 figures available, but incomplete. †Publication of data for second, fourth and sixth columns discontinued after Dec. 1942.

The year 1937 was still the record year in number of strikes since 1917. The number of strikes began to increase in 1933 and rose steadily through 1937.

Compiled from *Canadian Labour Gazette.*

The monthly reports on strikes issued by the U.S. bureau of labour statistics indicated that close to one-half of the strikes of 1941 involved some question of union recognition, with wages the other major issue. In 1943, the principal cause was wage disputes. In Great Britain a very large percentage of the strikes end definitely in favour of the employers, and disputes over union recognition are far less common than in the United States.

Canada had only 192 strikes in 1940 involving 63,469 workers and but 268 involving 97,580 employees in 1941. (*See* also LABOUR UNIONS; NATIONAL LABOR RELATIONS BOARD; UNITED STATES; WAR LABOR BOARD, NATIONAL.) (D. D. L.)

Strontium. Shortage in the supply of strontium in the United States was relieved during 1943, and the year ended with the supply in balance with essential demands. The latest available figures on production in the United States were: 4,724 short tons of strontium minerals in 1941, and imports of about the same size, both heavy increases over 1940. The demand was due to the use of strontium salts in tracer bullets and signal flares. (G. A. Ro.)

Submarines: *see* NAVIES OF THE WORLD.

Submarine Warfare.* **Axis Submarine Campaign.**—As the year 1942 ended the U-boat campaign in the Atlantic loomed large as the major threat to a United Nations' victory. On the land fronts things were going well; the epic of Stalingrad had turned the tide in Russia, General Eisenhower's combined forces were well established in North Africa, and even in the South Pacific the all-conquering Japanese were being driven back from their farthest outposts. But the wolf-packs of U-boats still, as shown in the record of shipping losses for 1942, were having their innings in the Atlantic. They remained the chief obstacle to successful conclusion of the European war, and that the menace was fully appreciated by the heads of governments of the United Nations was borne out not only by their statements but by the urgent actions taken to counter it. Even to the layman it was clear that, unless the U-boat's supremacy could be checked, the Allied forces in North Africa and Britain would not be properly supplied or augmented, and that the flow of lend-lease supplies to Russia would be insufficient to keep that valiant ally girt with the sinews of war.

Official quarters still remained silent on losses of merchant tonnage but, at the end of 1942, unofficial sources in close touch with the situation estimated that a minimum of 4,000,000 gross tons was lost to the Allies during the year. Some estimates (by the Truman committee of the U.S. senate) ran as high as 12,000,000 tons, an average of 1,000,000 a month, but this probably referred to deadweight tons—equivalent to about 8,000,000 gross tons. Secretary of the Navy Frank Knox admitted that Allied merchant losses were 1,000,000 gross tons greater than the combined gross tonnage of all cargo vessels built by the United Nations during 1942 As the United States alone built approximately 5,400,000 gross tons in 1942, and as the other Allies probably accounted for more than 1,000,000 more, it may safely be assumed that the total loss of United Nations' merchant shipping approximated 7,000,000 gross tons. This figure, however, was not as staggering as the admission that valuable bottoms and crews were still being destroyed at a rate considerably in excess of their replacement.

That Hitler was fully aware of the value of his underseas arm as his most likely hope of victory was evidenced in Jan. 1943 by his appointment of Admiral Karl Doenitz, his submarine specialist, to be grand admiral, succeeding to supreme command of the entire German navy. This appointment highlighted the role the U-boat was expected to play in the forthcoming campaign, for Doenitz was known as an able, crafty strategian who would get the utmost from the powerful weapon he had forged. The new grand admiral promptly announced his intention to "put the entire concentrated strength of the navy into the submarine war, which will be waged with still greater

EXPLODING DEPTH CHARGE from the U.S. coast guard cutter "Spencer," on convoy duty in the north Atlantic in 1943. As the convoy (background) proceeded on its course, the "Spencer" tracked down and sank a German submarine

vigour and determination."

Thus the curtain rose on the campaign of 1943. The might of the U-boat fleet was feared by all the United Nations and those months of early spring, when the full weight of the wolf-packs might be expected, assumed a nightmarish aspect. It was presumed that Hitler had available at least 400 U-boats, and some estimates ran as high as 700. To pit against these the Allies had a rapidly increasing number of antisubmarine weapons, but as yet these were new and untried. The outlook was dismal.

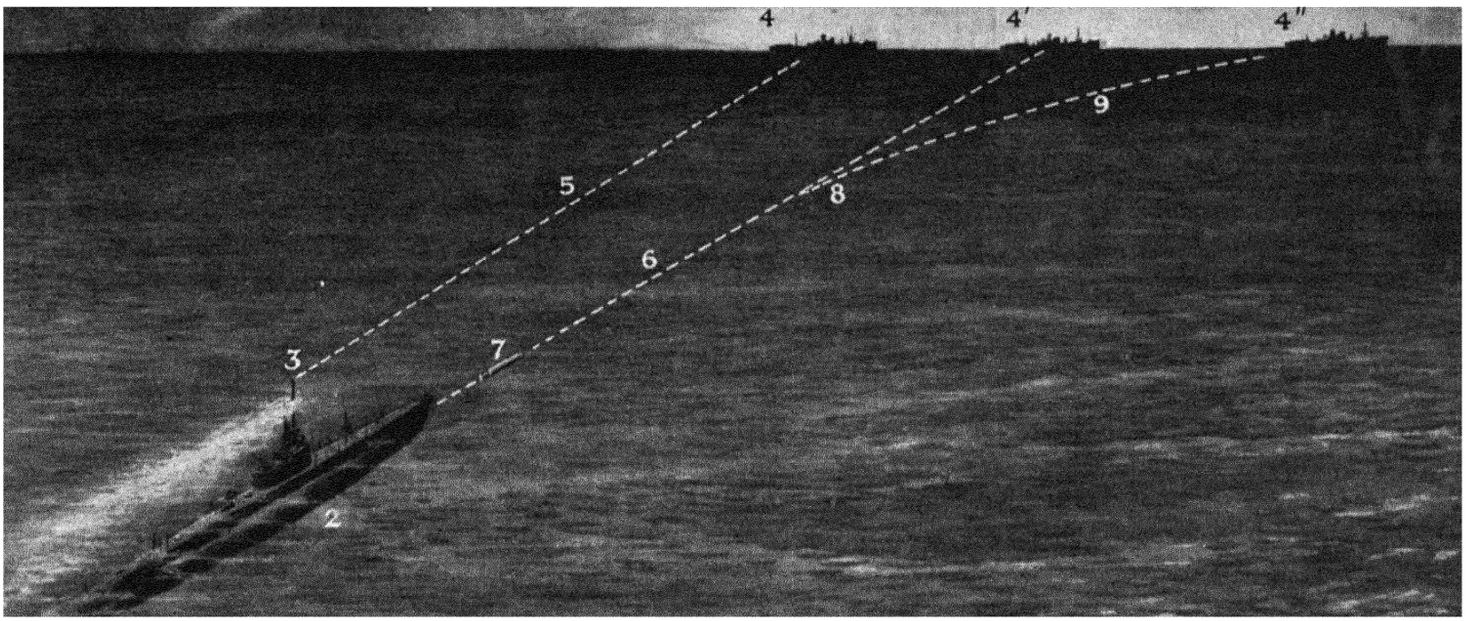
January, with high and wintry seas, was a bad month for the U-boats. Nine merchantmen were sunk during the first week, but these were mostly in the comparatively placid waters off South America. Eight more cargo bottoms were later reported sunk in the western Atlantic, then, at month's end, four more in the South Atlantic. Counting other scattered sinkings, the loss during January probably totalled close to 250,000 gross tons. Germany claimed a gross of 408,000 tons.

Early in February Secretary of the Navy Knox stated that there were then more U-boats at sea than during the critical month of June 1942; he added that the navy was "straining every effort to produce sufficient antisubmarine vessels." The United States was shocked by the torpedoing of two American passenger-cargo ships in the North Atlantic with a loss of 850 lives, mostly service personnel. But few other losses were reported, and in one week it was officially stated that there were no sinkings whatever in the western Atlantic—the first such week since Pearl Harbor. It is probable that total shipping losses in February were about 200,000 tons, and it was generally felt that Doenitz was saving his knockout blow for more propitious spring weather.

March, living up to expectations, started off with heavy U-boat blows in the western Atlantic, the nazis claiming 23 ships in the first five days. The wolves were out in force and were exacting a toll—at what price could only be guessed, but the results were serious. Official reports from both sides of the Atlantic indicated that antisubmarine craft were in attendance on the vital convoys in increasing numbers, but still the losses were so great that the outcome was in grave doubt. There were indications that March sinkings totalled close to 500,000 gross tons.

But April, usually the best month for U-boats, proved a surprise. Early in the month Berlin claimed the sinking of 14 Allied merchantmen in the Atlantic and Mediterranean, and 16 more in later wolf-pack attacks on northern convoy routes. U-boats were again active sporadically off the coast of the United States and in the Caribbean, but it was evident that the antisubmarine drive of the United Nations was at last taking effect. Whereas many experts expected disaster to the tune of at least 1,000,000 tons in April, the total sinkings are known to have been less than those of March and were probably in the vicinity of 350,000 gross tons. Even Germany claimed only 423,000.

Such a turn in the tide of battle was almost unbelievable and victory over the U-boat could not be claimed until borne out by a steadily decreasing rate of shipping losses in succeeding months. In May, Germany admitted its recent lack of success, blaming it on "extraordinarily bad weather, too many convoy lanes, and strong escorts"—an unusually honest estimate. Official Allied sources stated that now all transatlantic convoys were covered by an "air umbrella" throughout their entire passage, and the conduct of all convoys in the northwest Atlantic was concentrated in the hands of Rear Admiral L. W. Murray, an antisubmarine expert of the Canadian navy. Concurrently the 10th fleet, U.S. navy, was formed, composed of various types of antisubmarine craft in the Atlantic and under the direct command of Admiral E. J. King, commander in chief, U.S. navy, with Rear Admiral F. S. Low, U.S.N., acting as chief of staff with immediate supervision over its activities; the relationship between the 10th fleet and Admiral Murray's command remains unexplained, but is undoubtedly very close. The U-boat bag for May was probably about 300,000 gross tons, and a German radio broadcast alibied that there were "simply not enough ships which could be sunk."



June remained quiet and it became apparent that the nazis, suffering severe reverses, were recalling their U-boats from previously happy hunting grounds and were probing for more lucrative areas for attack. Two full weeks passed without a single sinking in the western Atlantic. Reports of killings of U-boats began to trickle in, adding up to so impressive a total that it appeared the submarines were finally on the defensive. It was reliably stated that escort craft (surface and air) were now present in such numbers that they could engage in active searching for U-boats at a distance from the convoys, keeping them almost immobilized beneath the surface and unable to close with their prey. Losses in June dropped to the lowest in 19 months, about 120,000 tons. Days passed without the sinking of an Allied cargo vessel in any ocean and there was no discounting the remarkable victory over the U-boat. Prime Minister Winston Churchill, after announcing heavy losses of U-boats during May and June, added: "Staggered by these deadly losses, the U-boats have recoiled to lick their wounds and mourn their dead." It was generally believed that they were withdrawn from the now lethal North Atlantic to be refitted with more effective defensive gear and new tactics. They would return again to the fight.

In July, Rear Admiral W. P. Blandy, U.S.N., chief of ordnance, let fall hints of a new antisubmarine weapon. He stated that something very secret, but much more effective than depth charges, was now being employed against U-boats. In spite of this, however, there was an abrupt increase in shipping losses in isolated areas. Wolf-packs were reported off Brazil, torpedoings flowered in the Mozambique-Madagascar area, and there was considerable activity in the Caribbean and off the African coast. It is probable that about 300,000 tons were sent to the bottom—a considerable rise over June. North Atlantic convoys were unmolested.

August was notable for the first official announcement of U-boat losses. President Roosevelt and Prime Minister Churchill issued a joint statement that, during May, June and July, the Allied forces had definitely destroyed more than 90 U-boats. This news brought home to the public the decided turn for the better, and English-speaking peoples everywhere breathed more easily. It was emphasized, however, that the battle was not yet completely won, that there were still tremendous U-boat reserves which could be expected to return to battle refreshed and refurbished with a better defense. During August steps were taken to improve convoy escorts in the South Atlantic, with the result that total losses for the month were reduced to approximately 200,000 gross tons. The Office of War Information (U.S.) stated that now more U-boats were being sunk than merchantmen.

September was still better. Mr. Churchill said that during four months no ship had fallen prey to U-boats in the North Atlantic, and added that during the first two weeks of September "no Allied ships were sunk by U-boat action in any part of the world." Submarines were still active in scattered areas, however, and at month's end there were again reports of wolf-packs prowling the North Atlantic. In spite of this, and of German claims exceeding 300,000 tons, the total loss of cargo bottoms was probably not more than 150,000 gross tons.

Despite the decisive turn in the tide, the underseas weapon still offered the greatest promise of strategical success for Germany, and this was recognized by Hitler and Doenitz. Portugal's permission for the Allies to use the Azores for antisubmarine bases was, however, a heavy blow to nazi hopes, for this made possible continuous air coverage over the convoy routes to the

THE LEON TORPEDO, a version of which was possibly used by the Germans during 1943 in submarine attacks on allied shipping, was designed to correct miscalculations made by a submarine gunnery officer in aiming torpedoes at enemy ships. The diagram shows a submarine (2) at a distance of several miles from the target vessel (4). The line 5 represents the line of sight from the submarine's periscope (3) to the enemy ship. The submarine's gunnery officer, basing his calculations on the speed and direction of the target vessel, assumes that it will reach the position 4' by the time the gyroscopically-steered torpedo (7) has reached it. The torpedo is therefore aimed along the line 6. However, such unforeseeable circumstances as a change in the speed or direction of the target vessel may enable it to reach, for example, the position 4" by the time the torpedo arrives at the position 4'. The Leon torpedo corrects any error in the torpedo's direction after the missile has been fired. It contains, in addition to its gyroscopic steering device, a mechanism which is sensitive to the vibrations set up in the water by the propeller of the target ship. When it picks up these vibrations, it takes over the functions of the gyro (at the point 8) and steers the torpedo along the course 9 directly into the propeller of the target ship

Mediterranean. Again in October the U-boats launched mass attacks to feel out the situation in the North Atlantic, but with little success. Such few sinkings as were accomplished, added to scattered losses, totalled probably not more than those in September—150,000 gross tons.

The curve of merchant sinkings seemed now to have flattened out at about 150,000 tons a month, and this was probably close to the nazi toll again in November. December started with a big spurt, but this was largely the result of the sneak air raid on the crowded harbour of Bari, Italy; U-boats had but little connection with the losses. After a long hiatus, however, they were again active in the Gulf of Mexico and off Cape Hatteras, accounting for one ship in each area, and in the Caribbean, where they destroyed five merchantmen during the month. Berlin claimed a toll of 225,000 tons, but it is probable that again it stayed close to the monthly average of 150,000 gross tons sunk by all methods.

At the end of 1943, German broadcasts asserted that 3,784,500 gross tons of Allied merchant shipping were sunk during the year by all methods, the U-boat being the principal weapon of destruction. In previous years nazi claims were about twice the amount of actual losses. But now, possibly due to despondency over the failure of the U-boat, their claims were not so extravagant. It is probable that actual losses for the year were approximately 2,700,000 gross tons—a discrepancy of about 1,000,000 tons favouring the United Nations. This was little more than half that of the best previous full year of the war, and probably only about one-third of the loss during 1942. Fully to realize the implications of these figures one must remember that 1943 was conceded to be the critical year of U-boat warfare, the year in which Germany reached the peak of her submarine might, the year when Doenitz expected to hurl back decisively the threat from America. The U-boat was convincingly defeated on its own battleground, and this Allied victory assumes equal stature with the crushing of nazi hordes in Russia during the same period. In fact, the latter was to a large extent dependent on the former.

It seems worthwhile to examine the causes of this crucial victory. To achieve it required the mustering of many weapons, the perfecting of old ones and the invention of new ones. By the combination and co-ordination of all these weapons in a magnificent spirit of aggression the battle was won.

First, the intensified production of cargo vessels on both sides of the Atlantic, but especially in the United States. This is a negative form of action—it increases merchant bottoms in the attempt to keep pace with sinkings, but does nothing to decrease U-boat activity. In 1942 the production of new ships was less than those sunk, but in 1943, when almost 12,500,000 gross tons of new merchantmen were produced in America alone, production so outstripped destruction that it attained a commanding lead. The opening of the Mediterranean in June acted, in effect, to increase considerably the tonnage available to the United Nations by materially shortening the long lines of supply to the middle east and India. The danger of lack of shipping seemed in 1943 to be forever past.

Second, mass production of escort and other antisubmarine craft. This had been greatly accelerated after the entry of the United States into the war. In Britain the frigate superseded the smaller corvette, while in America a new type, called a destroyer escort, was designed for the sole purpose of hunting U-boats on the high seas; this latter type is almost as large as a destroyer but lends itself to production-line manufacture while lacking the speed and armament of its big sister. By March these hunters had taken their stations about convoys in such numbers that they were able to forsake traditional defense measures and form offensive groups to search out the underseas enemy. Patrol craft and submarine chasers were also being commissioned in large numbers. By October's end the situation was so well under control that Secretary of the Navy Knox announced that contracts for 427 antisubmarine craft had been cancelled, 305 of these being destroyer escorts. No more pertinent commentary on the state of the U-boat campaign could have been promulgated.

Third, shore-based air patrols. After the outbreak of war in 1939 the coastal command of the royal air force played a vital

role in the battle against the U-boat. Handicapped at first by lack of range, it managed by dint of hard flying to keep the waters about Britain clear of underseas bandits. As successively longer-ranged planes became available the U-boat was driven ever farther into the Atlantic. The United States and Canada soon augmented these patrols, flying from frigid bases in Newfoundland, Greenland, Iceland, until in 1943 only short stretches of ocean were not covered by the huge observation and bombing planes of the Allies. When bases in the Azores were obtained in October the middle Atlantic routes also came under their protection. Another unheralded group of planes kept constant watch over the Bay of Biscay, and these avenging angels were responsible for holding down the U-boats enroute to or from their bases in occupied France.

Fourth, auxiliary carriers. Not until 1943 did these merchantmen, converted into aircraft carriers, really get into the fight. They ranged mid-ocean, where land-based planes could not reach, covering with their brood of planes areas far ahead and on the flanks of the convoy, and operating to keep the U-boats down just when they most needed their surface speed to reach attack positions. The first real news of the "baby flat-tops" came in March when Secretary Knox announced that dozens of them were already in operation. From then on they were much in the public eye. They haunted those sea stretches where the U-boat was most active and, in addition to keeping it immobilized, were credited with more than their share of sinkings. In this writer's opinion the auxiliary carriers were more responsible for the U-boat's defeat than any other one factor.

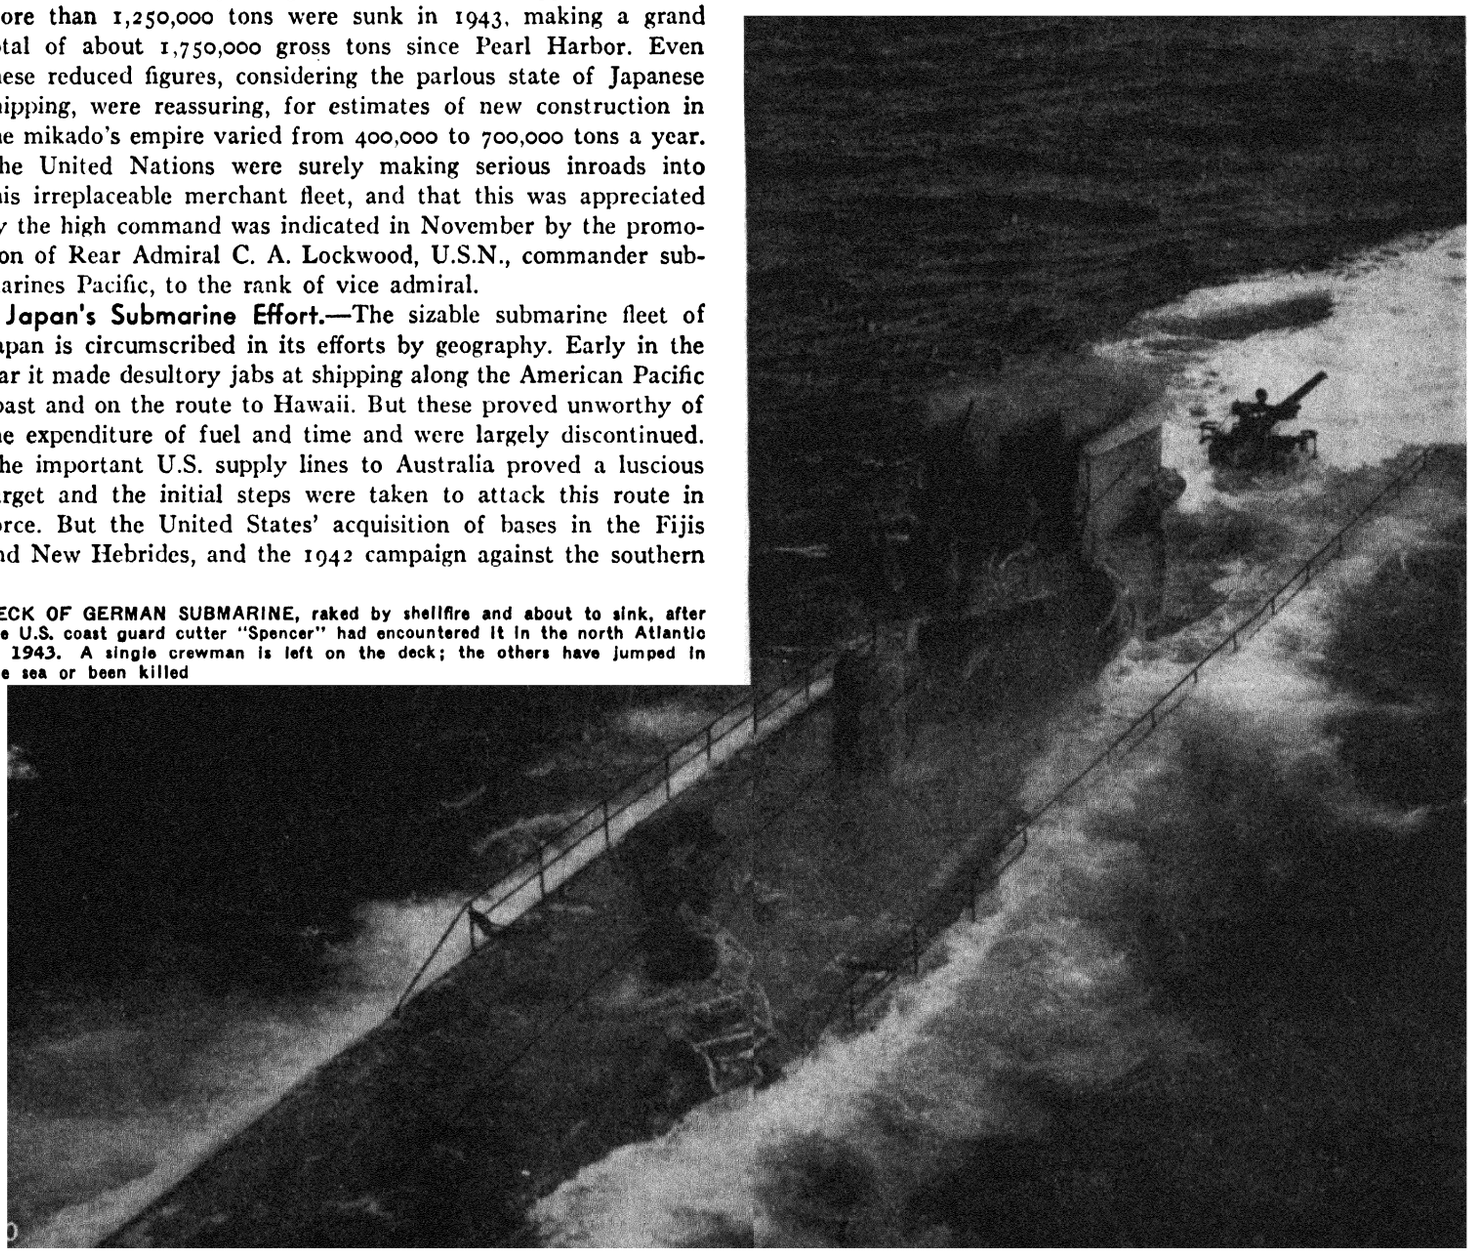
Fifth, bombing at the source. The battering by United Nations' bombers of U-boat construction yards and repair bases in Germany, France and Norway was pursued vindictively during the winter and spring months, and the precision daylight bombing by the 8th U.S. air force was particularly effective. It is doubtful if many U-boats, protected by bombproof pens, were themselves severely damaged, but the devastation inflicted on building and repair facilities had the unquestioned effect of greatly extending the stay of the U-boats in port. To escape these deadly bombings Germany transplanted some building yards to the eastern Baltic; evacuation of civilians from the operating bases at Lorient, Brest and St. Nazaire was also necessary. After May such raids were less frequent—a silent commentary on the state of the U-boat campaign. Toward the end of the year the 15th U.S. air force, from bases in the Mediterranean, heavily raided the U-boat lairs at Marseilles and Toulon, indicating that axis submarines were becoming obnoxious in the middle sea.

Sixth, blimps. While these are short-ranged and used only for coastal convoys, they, because of their ability to hover over a danger spot, have proved invaluable. They were produced in increasing numbers and the U.S. navy boasts that no merchant ship has been lost from a blimp-protected convoy. The same, however cannot be said of the blimps; in July, off the Florida coast, one was shot down by a U-boat.

Seventh, technological advances. Scientists of the United Nations pitted their wits against those of the axis to keep anti-submarine measures a jump ahead of the U-boat. While most of this work was of a secret nature it seemed that they had been successful. Electronic devices were developed for both surface and submerged work, and these were probably of vital importance to the escort and aircraft in locating the U-boat. Depth charges were stepped-up to cope with strengthened hulls, and new methods of laying them were devised. The chief new nazi weapon was the acoustic torpedo, which is directed to its target and exploded under its stern by the target's propeller noises, crippling both motive and steering power and leaving the merchantman a helpless victim to a later orthodox torpedo. As yet there was no hint of the nature of the amazing new weapons stated by Admiral Blandy to be in service. The British, however, stated that aircraft in 1943 were carrying searchlights of such intensity that U-boats were forced to remain submerged even at night.

British Submarines Against Supply Lines.—The splendid work carried on in the Mediterranean in 1942 against Field Marshal Erwin Rommel's lines of supply to North Africa was maintained valiantly during 1943. Aided by a few Greek, Polish, Dutch and Yugoslav submarines operating under the British high command, the British undersea force achieved phenomenal results. Working in narrow waters under constant surveillance by enemy aircraft, they rendered the short passage of axis supply ships and transports so dangerous that possibly less than half of them got through unscathed. Realizing that the fate of the empire rested on them, the submarine captains exerted every effort to stem the flow of munitions to Africa.Their success was epitomized by the understatement of Admiral of the Fleet Sir Andrew B. Cunningham, R.N., Mediterranean commander in chief: "Our submarines had a very good time—and some made surprising bags." At the time of the September invasion of the Italian mainland British submarines had reportedly sunk a total of 1,335,000 gross tons since the beginning of the campaign. They continued to take a steady though lighter toll, pursuing axis cargo carriers into the Tyrrhenian, Adriatic and Aegean seas. During the height of the Mediterranean campaign most of Britain's submarine fleet was probably operating there. But results warranted such a concentration, and it is unquestionable that they played a decisive role in the defeat and expulsion of Rommel's Afrika Korps, and in clearing the vital Mediterranean lifeline.

U.S. Submarines in the Pacific.—In the far western reaches of the Pacific was waged throughout 1943 a war of attrition against the Japanese which was a miniature of the U-boat campaign in the Atlantic but which greatly outstripped its nazi counterpart in comparative success. Operating from Hawaii against Japan's home waters, from Australia against Japanese supply lines in the conquered Indies, and from Aleutian bases against the Kuriles and northern routes, fine American submarines, acting mostly as lone wolves, struck heavy blows at the lifelines essential to the maintenance of Japanese control. To appreciate fully the strategical necessity of this campaign one must understand Japan's shipping predicament. It was reliably estimated in 1941 that Japan had slightly in excess of 7,000,000 tons of cargo bottoms, counting those United Nations' ships that were confiscated in oriental ports. This was more than sufficient to serve the nations' normal needs but, with the rapid expansion of empire southward, it was entirely incapable of coping with the complex burden of supplying advanced bases, moving armies, and carrying loot, in the form of raw materials, back to the homeland. Quickly recognizing that here was the Achilles' heel of Japan, Admiral C. W. Nimitz, U.S.N., commander in chief Pacific, a submarine pioneer, directed that this weakness be fully exploited. Although some submarines were diverted to patrol and reconnoitre off enemy bases, the main force was concentrated on this attenuated line of supply.



Results were excellent. On Jan. 2, 1943, the navy department reported the sinking of the 112th Japanese ship, and on Dec. 28 the total sunk was announced as 386—a net increase for the year of 274 ships. In addition to these almost sure losses (the navy analyzes each reported sinking and accepts only those that are foolproof) there were 36 more probably sunk and 114 damaged. These losses included the few combatant ships that succumbed to pig-boat torpedoes, but the great majority were cargo carriers, either merchant or naval. Between these dates United

States submarines haunted the coastal routes along the main Japanese islands and occupied China, the waters about the Philippines and Malaysia and, in one case, were reported in the sacrosanct and narrow Straits of Tsushima, separating Japan from Korea. Daring feats and large bags featured the press releases from the navy department; presidential unit citations were awarded a number of underseas raiders, as in the case of the renowned "Wahoo" which, in a 14-hour battle with a heavily armed convoy, sank all four of the valuable ships in it—a total of 31,890 gross tons.

In estimating the amount of Japanese tonnage lost during the war it must be remembered that the great majority of Japanese cargo carriers are in the coastal trade and are accordingly of relatively low tonnage. It is known that the Jap resorted to the use of junks and barges, and started building these in large numbers in the shipyards of occupied China. In September, Secretary Knox estimated that more than 2,500,000 tons of Japanese shipping had gone down, this total amounting to one-third of that available, counting what had been seized, salvaged and repaired; 77% of the sinkings were accomplished by submarines, including a few Hollanders. This tonnage loss is probably a bit high, and based on over-optimistic reports from submarine skippers. Assuming the average Japanese cargo bottom to be somewhat under 5,000 gross tons, it would appear that not more than 1,250,000 tons were sunk in 1943, making a grand total of about 1,750,000 gross tons since Pearl Harbor. Even these reduced figures, considering the parlous state of Japanese shipping, were reassuring, for estimates of new construction in the mikado's empire varied from 400,000 to 700,000 tons a year. The United Nations were surely making serious inroads into this irreplaceable merchant fleet, and that this was appreciated by the high command was indicated in November by the promotion of Rear Admiral C. A. Lockwood, U.S.N., commander submarines Pacific, to the rank of vice admiral.

Japan's Submarine Effort.—The sizable submarine fleet of Japan is circumscribed in its efforts by geography. Early in the war it made desultory jabs at shipping along the American Pacific coast and on the route to Hawaii. But these proved unworthy of the expenditure of fuel and time and were largely discontinued. The important U.S. supply lines to Australia proved a luscious target and the initial steps were taken to attack this route in force. But the United States' acquisition of bases in the Fijis and New Hebrides, and the 1942 campaign against the southern Solomons, deprived the Japs of any really effective bases for such operations. There remained only the coastal route along eastern Australia, and here the underseas craft of Japan were reported active in May and again in October. General Douglas MacArthur, U.S.A., stated that wolf-pack tactics were employed, and his spokesman (unidentified) admitted a loss of 2% of shipping in the southwest Pacific, but this percentage was probably effective only during a relatively brief period. In May the Australian hospital ship "Centaur," properly marked and lighted, fell prey to a Japanese pirate, the loss of life being fairly light —299 doctors, nurses and crew. Some of the sinkings in the western Indian ocean, generally credited to U-boats, were possibly the work of Japanese submarines, but even so, their success against shipping lanes was inconsequential and their chief efforts were directed against naval objectives.

Russian Submarines in Commerce Warfare.—There is always a paucity of news regarding all submarine operations, but from Russia, known to have sizable underwater flotillas, there came complete silence. About 50 submarines were working in the Black sea and, although any knowledge of results was lacking, it was probable that these continuously harassed the Rumania-Crimea supply line. Other Russian boats were known to be operating in the Barents sea against German lines to northern Norway and Finland, and the fact that the luftwaffe heavily

DECK OF GERMAN SUBMARINE, raked by shellfire and about to sink, after the U.S. coast guard cutter "Spencer" had encountered it in the north Atlantic in 1943. A single crewman is left on the deck; the others have jumped in the sea or been killed

bombed Russian submarine bases indicated that this campaign had more than nuisance value. At least 50 submarines were known to have been stationed at Vladivostok in the Pacific; while these were inactive as long as Japan and Russia remained at peace, they constituted a real threat in case of an eventual break.

Blockade.—Blockade is, of course, another form of warfare against shipping. In the past it was a nonviolent method, sanctioned by international law, of preventing a neutral nation from supplying one's enemy with the sinews of war. It was enforced by proclamation, coercion and, as a last resort, force. To be binding it must be effective; that is, naval craft must be off the blockaded coast in sufficient force to ensure compliance. In World War I the U-boat soon rendered a close blockade too dangerous to be practical. Further, in its all-out attack on both enemy and neutral shipping, it discarded the accepted rules of visit and search because they were not in concord with the nature of a submarine. Consequently such blockades as remained were conducted along the shipping routes far from the enemy's coasts and merchantmen were coerced into proceeding to belligerent control ports for examination and possible condemnation. The coming of the aeroplane further sounded the death knell of the old-style blockade.

In World War II, Britain imposed much the same sort of distant blockade; it was never, however, legally declared. But, as most neutral nations themselves became involved in hostilities, there remained but few merchantmen against whom a blockade could be imposed—for enemy cargo carriers are always legitimate game. The warfare carried on by U-boats against transatlantic shipping and by the U.S. submarines against the Japanese lifelines might be termed, in an unorthodox sense, blockade. But there was in 1943 no legal use of blockade as an economic weapon. Blockade still existed, however, in a real sense, as evidenced by the continuing use of United Nations seapower to prevent overseas trade with Germany or any of its satellites. Germany struggled to escape full pressure of this throttling grip by dispatching blockade runners. In 1943, these went, as far as was known, only to Japan, and some were said to be specially constructed submarines of low cargo capacity. While it is doubtful if these achieved any measure of success, such expeditions were sure indications of the extremity of nazi economy.

Submarines in Naval Actions.—In addition to their unending war on shipping, submarines play an important role in naval warfare. Even when destruction of cargo carriers is their primary mission, they never fail to grasp an opportunity to attack an enemy man-of-war. They are also employed in a calculated war of attrition; if submarines are sprinkled liberally enough throughout naval operating areas they are bound eventually to sink a few combatant ships. They see wide employment as scouts, searching in advance of fleets or task forces, or reconnoitring off enemy bases. They have definite value in a fleet action (though not yet so used) to deny certain areas to the enemy, and, following in the wake of battle, to pick off stragglers. Many odd chores fall to the lot of this versatile type—anything that requires stealth and secrecy. By and large, submarines were singularly unsuccessful against men-of-war during 1943, but such uses of this nature as occurred are recorded, as far as secrecy will permit, below.

Germany and Italy.—In February, Germany claimed the U-boat sinking of a "Dido"-class British cruiser in the eastern Mediterranean; this remains unverified. In April, the British destroyer "Harvester" was sunk by U-boat action, and later in the same month the German high command claimed the sinking of the U.S. aircraft carrier "Ranger" in the Atlantic; the navy department vigorously denied that this or any other combatant ship had been sunk, so the episode remained a mystery in 1943. In October, the United States reported the loss of three destroyers and a minelayer from "underwater explosion"; possibly these craft were also U-boat victims. In November, the old U.S. destroyer "Borie" sank after a long death struggle with a U-boat, in which her adversary was also lost.

Great Britain.—In April, a British submarine in the Mediterranean blew the bow off an Italian cruiser; its fate was not divulged. In May, an Italian destroyer was sunk in the Mediterranean. In September, midget submarines launched an attack on the pride of the nazi navy, the battleship "Tirpitz," in Alten fjord in northern Norway. Reconnaissance photographs indicated that the "Tirpitz" was badly injured and would be immobilized for months. This was the first public intimation that the British indulged in midget submarines, and nothing is known of their characteristics. The operation was carried out over 1,000 mi. from the nearest base and involved the passage of intricate minefields, nets and obstructions. Three of the midgets were lost. British submarines were also used, chiefly in the Mediterranean, for varied bombardment missions.

Japan.—As previously mentioned, Japan found it difficult to operate against Allied supply lines, so the majority of her submarines were concentrated in combatant areas. The Coral sea and adjacent waters were infested with them in hopes of attacking the omnipresent naval forces or, if attack proved impossible, to wear them down by keeping them constantly on the alert. Few actual sinkings of combatant U.S. vessels were reported and, in view of the navy department's record of candour, it is probable that all that occurred were admitted. It is also likely that some warships were torpedoed but not sunk and that, for reasons of security, these casualties were kept secret. Early in July, the new destroyer "Strong" was sunk in Kula gulf under circumstances that point to a submarine as the offender. Shortly thereafter the transport "McCawley" was sunk, after having been damaged by a bombing which made her an easy prey to a submarine lurking off Rendova island. A few nights later the U.S.S. "Helena," a 10,000-ton 6-inch cruiser, laden with battle honours, was lost in the American victory off Kula gulf; she went down under the impact of three torpedoes in rapid succession, indicating that they came not in the wide spread from a distant destroyer but were fired from a fortunately placed submarine close aboard. In November, at the invasion of Tarawa, the auxiliary carrier "Lipscombe Bay" exploded as the result of a submarine torpedo hit and sank with a large loss of life. The Japanese made masterly use of the submarine in ferrying supplies and reinforcements to Guadalcanal and other beleaguered islands. They were probably used in the evacuation of Kiska. That they were being regularly employed in reconnaissance and as scouts was common knowledge, and that some carry aircraft was verified by the sighting, over Sydney and near Hawaii, of single small Japanese float planes. Japanese submarines were also used for isolated nuisance bombardments. In spite of the lack of merchant targets they were put to a very effective use.

United States.—The main effort being directed against shipping, Japanese men-of-war were, for U.S. submarines, largely targets of opportunity. Such targets, however, loomed up fairly regularly on the crosswires of American periscopes. In October, the navy department reported that a total of 3 cruisers, 22 destroyers, 2 tenders and 12 other combatant ships (all Japanese) had gone to the bottom as the result of submarine torpedoes. How many of these were sunk in 1943 was not stated. Among the "others" was the unnamed gunboat, rammed by the submarine of Commander Howard Gilmore who, lying wounded on his bridge, ordered his mate to "Take her down!" at the expense of his own life but saving his ship and crew. No Japanese submarines were officially listed as lost in those weird "submarine versus submarine" encounters although there were unauthenticated reports that two

had been so sunk. American submarines were probably also used on scouting and reconnaissance missions, and there were rumours of their landing shock troops at the beginning of various offensive operations.

Submarine Losses.—*Germany and Italy.*—During 1943, anti-submarine measures (*see* above) became really effective. Even during the bad winter months sure sinkings of U-boats were reported in increasing numbers. With the advent of spring, reports of still heavier submarine losses made the headlines, and these were verified by the joint statement of President Roosevelt and Prime Minister Churchill in August that during the three preceding months there were "over 90" sure sinkings of U-boats. Thereafter, due to the recall of the U-boats from the convoy lanes to new areas and for refitting, the rate dropped. Sinkings continued to be reported in the press, but no more official figures were vouchsafed until October, when another joint statement announced the loss of 60 U-boats during July, August and September. The rate of sinkings, then, was 25 axis submarines a month during the six most propitious months of 1943—undoubtedly greater than the rate at which they were being built. It may be assumed that the rate for the remaining six months was at least half as great, and that not less than 135 axis submarines were destroyed during the year. To this must be added those Italian submarines that fell into United Nations' hands with the capitulation of Italy—probably about 50. The blow to Doenitz' campaign was stupendous and it is remarkable that U-boat morale stood the shock so well. No figures on axis losses were forthcoming from Germany.

Great Britain.—The loss of eight submarines ("Utmost," "Sahib," "Traveller," "P222," "Splendid," "Saracen," "Parthian," "Trooper") was noted during the year—also one Greek and one Fighting French submarine, both operating with British forces in the Mediterranean. In September, the admiralty announced (their figures have always been trustworthy) that a total of 56 British submarines had been sunk during the war; it is doubtful if the figure had reached 60 at year's end.

Japan.—An estimate of Japanese submarine losses is difficult. Individual claims during the year had been noted to a total of 17, and in February the Associated Press tabulation estimated the number sunk since Pearl Harbor at 29. Yet, in October, the navy department reported only 6 sure sinkings since the beginning of the war. On the other hand official Japanese sources have admitted a total loss of 11 submarines through November. As Japanese admissions regarding other categories of ships had been found to be quite accurate there was reason to believe that their figures were the best available. The low number of Japanese sinkings, however, indicated either (1) skilful submarine captains, (2) excellent defensive qualities, (3) inadequate antisubmarine measures by the United States, or (4) lack of full employment of Japanese submarines.

United States.—Eleven U.S. submarines were announced as overdue and probably lost during the year ("Argonaut," "Amberjack," "Grampus," "R-12," "Triton," "Pickerel," "Grenadier," "Dorado," "Runner," "Wahoo," "Grayling"). The giant "Argonaut," after being damaged by depth charges, went down in a blazing gun duel with Japanese surface craft. The "R-12" was lost while on a routine training cruise. The others, including the famous "Wahoo," disappeared without trace in the western Pacific. These losses are approximately double those of 1942 but it was probable that the ratio of losses to submarines operating had changed but little. It was expected, however, that this rate would increase in the future because of the tremendous expansion of the submarine force and the consequent dilution of experienced personnel, and of improved Japanese antisubmarine measures. It is interesting to note that Japan's navy war minister, Admiral Shimada, announced the sinking during the war of 128 U.S. submarines.

New Construction.—*Germany.*—Estimates of the monthly rate of U-boat construction vary widely. The maximum rate was probably achieved in 1942, about 25 a month. New construction in 1943 was on the wane for two reasons: (1) the heavy bombardments of building yards and parts factories, (2) the necessity for building larger U-boats to reach unprotected areas. While no definite figures were available, it seemed likely that not more than 15 new boats were being produced each month, and that the size of the U-boat fleet in 1943 was approximately 350. The rate of destruction definitely passed the rate of construction. Reliable sources stated that construction of the 517-ton class was suspended and that the majority of new boats were of the more versatile 740-ton type. These have an endurance of 16,000 mi. and achieve a surface speed of nearly 20 knots. It was reported that they were fitted with additional topside armour to permit them to remain on the surface during strafing attacks. They were also being fitted, in addition to their 4.1-in. guns, with an increased number of anti-aircraft weapons, ranging in calibre up to 40-mm. During the year the use of supply submarines (known as "milk cows") was confirmed. These were broadbeamed, unwieldy submersibles, designed to carry quantities of diesel oil, torpedoes, ammunition, water and provisions, and to deliver these to operating U-boats at secret rendezvous at sea. A few large U-boats of more than 1,000 tons, for extreme range and minelaying purposes, probably continued to be built, and rumours were also heard of experimentation with midget types, but these had not been reported in action.

Great Britain.—No reliable information was available. New submarine construction in 1943 had probably not greatly exceeded losses.

Japan.—No data.

United States.—Because of the remarkable success of U.S. submarines against Japanese lines, American shipyards were probably turning out new boats at record speed. They were near the top of the priority list. Secretary Knox stated that "new submarines completed this year would be equal to 30% of the submarine fleet in existence on Jan. 1, 1943." It was estimated that approximately 150 U.S. submarines were in commission in 1943, and this number was steadily increasing.

U.S.S.R.—No data. Probably little new construction.

Submarine Personnel.—*Germany.*—In May, unofficial Allied sources estimated that 12,000 U-boat officers and men were either lost or prisoners. Since that time probably 6,500 more suffered like fates. Such casualties would surely affect the efficiency of remaining U-boat crews; already their increasing lack of daring and proficiency was noted in 1943. From Sweden came reports of U-boat mutinies at Norwegian bases and disturbances at Kiel. Rear Admiral Low stated that Germany found it necessary to draft submarine crews. Experienced U-boat personnel was apparently being spread very thin, accomplished skippers were few, and veteran crewmen formed but a nucleus for a complement of green hands. But there were in 1943 no indications of a general cracking of morale, and it was expected that the U-boat menace would continue in decreasing intensity as long as Germany remained a belligerent.

Great Britain.—Not having experienced rapid expansion, British submarine personnel remained, as far as is known, capable and daring.

Japan.—Results against combatant ships indicated that Japanese submarine crews were well-trained and had a high morale.

United States.—The American submarine force underwent a rapid expansion, and a dilution of veteran personnel was inevitable. Because, however, of the highly selective nature of

this duty in peacetime, and of the thorough and strenuous training, new submarines could be expected to be provided with adequate crews.

Submarine Tactics.—Except in Germany, nothing new developed, as far as was known, in submarine tactics. Early in 1942 it appeared that Grand Admiral Doenitz was reverting to the tactics of the wolf-pack, this time throwing as many as 20 to 30 submarines, in echelons, into a single continuing attack on a convoy. Reports were meagre, but it is probable that these echelons were staggered, about 100 mi. apart, across possible convoy tracks. The first U-boat to sight the convoy fell in astern of it, making no attack but "homing" her consorts on the target by radio direction finders. When the horde was assembled about the convoy the signal to attack was given, usually at evening twilight. Two or more U-boats would feint from ahead, attracting the attention of the convoy's escorts and drawing them off in pursuit. When these were in full chase the remaining U-boats would launch their attacks from the flanks and astern, approaching in the awash condition and slamming torpedoes at any targets that crossed their paths. In order to prosecute successfully this plan the U-boats must use their high surface speed during daylight to make and retain contact with the convoy. The obvious counter to this attack was to keep them submerged during the critical hours of concentration, and the answer was found in a heavy screen of aircraft circling at some distance about the convoy. This protection was afforded by long-range planes from shore bases, and by planes from small auxiliary carriers when in mid-Atlantic. As soon as this "air umbrella" was perfected, sinkings of merchant ships dropped off precipitously while U-boat losses soared.

If the U-boat were to continue to be a dangerous weapon new tactics must be designed. In desperation Admiral Doenitz withdrew his flotillas from the North Atlantic and sent some of these in search of less well-protected areas. Others he recalled to their bases for refitting. Here they were provided with heavy anti-aircraft batteries, and their crews were trained to use them; radio echoing devices for the earlier location of Allied aeroplanes were installed; topside armour was added. They were then, in September, sent back into the fray to battle their way on the surface through opposing aircraft to the vital convoys. They again launched heavy and concerted attacks, using these new weapons and tactics; again they were largely unsuccessful, although they did manage to bring down a number of Allied planes. There were no further innovations, but the U-boats could be expected to sally forth again and again, with new methods of attack, as long as Germany remained in the war, and it was likely that some of these would bring a temporary measure of success. Only by eternal vigilance could the U-boat be held in check. (*See* also NAVIES OF THE WORLD; SHIPBUILDING; WORLD WAR II.) (E. E. HA.)

Sueyro, Saba H. (1890?–1943), Argentine naval officer and politician, completed his studies at the Argentine Naval college in 1910 and later went to the United States for further naval training. A torpedo and mine expert, he held several naval commands, eventually reached the rank of rear admiral and commanded the Rio Santiago Naval base. He had served as naval attaché to Washington and in 1942 headed the Argentine military purchasing commission to the U.S. to negotiate for the purchase of arms. He was named vice president of Argentina following the *coup d'état* of Gen. Arturo Rawson in June 1943, and continued at that post when Gen. Pedro Pablo Ramírez took over the government several days later. He died in Buenos Aires, July 17.

Sugar. The total production of sugar from sugar cane and sugar beets combined in 1943 was estimated by the U.S. department of agriculture to be more than 200,000 tons below 1942 because of the decreased beet sugar crop The acreage of sugar cane was larger in 1943 and the yield higher—21.5 tons per ac. compared with 18.5 tons per ac. in 1942 and 18.6 for the ten-year average. The acreage and crop grown for seed was above the average. In addition to the sugar, 42,423,000 gal. of molasses, including blackstrap, were produced from the cane. Most of the crop was harvested before Dec. 1, although crushing usually extends into January. Factories were unable to operate steadily because of the shortage of labour to cut the cane.

The production of beet sugar as reported by the factories was 938,000 short tons in 1943 compared with 1,613,000 tons in 1942 and a ten-year average of 1,452,000 tons in 1932–41. The acreage of sugar beets was only 552,000 compared with 945,000 in 1942 and 833,000 as the ten-year average. The yield per acre was also less than in 1942 but equal to the average. The crop as a whole was about 44% less than the near record crop of 1942 and the smallest since 1922. The causes of this bad year were the unfavourable weather at planting time, the scarcity of labour, difficulties in harvesting the 1942 crop which discouraged growers, and the competition for the use of the land for other crops requiring less labour. In Michigan and Ohio there was much abandonment because of late planting and poor stands. The reduced acreage was harvested without serious loss due to labour shortage.

Sugar rationing continued through 1943 with little change, although imports of Cuban sugar improved early in the year. In July the allotment for commercial canning was raised to 100% of 1941 usage. Other measures for relief of home canners pro-

SUGAR BEET REFINERY at Picture Butte, Alberta, Canada

Table I.—*U. S. Production of Beet Sugar by States, 1943 and 1942*

State	1943 short tons	1942 short tons	State	1943 short tons	1942 short tons
Colorado . . .	244,000	321,000	Utah	64,000	82,000
California . . .	168,000	347,000	Michigan . . .	40,000	172,000
Montana . . .	102,000	141,000	Wyoming . . .	27,000	62,000
Idaho	78,000	145,000	Ohio	7,000	54,000
Nebraska . . .	76,000	104,000	Other states . .	123,000	185,000

Table II.—*U. S. Production of Cane Sugar, 1942, 1943 and 10-Year Avg.*

State	1942 Short tons	1943 Short tons	Average 1932–41 Short tons
Louisiana	400,000	454,000	329,000
Florida	60,000	100,000	61,000

vided a maximum of 25 lb. per capita for persons with large fruit supplies. Supplies of sugar were large enough at the end of the year 1943 to provide adequate stocks and provide for consumption and export considerably larger than in 1942.

The world sugar markets were divided into three major areas by the war,—Japanese-controlled Asia, German-controlled Europe and the United Nations areas. There was no trade between these areas, which left the United Nations primarily dependent on the production of the western hemisphere. Prior to the war this was a surplus area to the extent of about 1,300,000 tons which was mostly shipped to Europe The estimated supply of sugar available at the end of 1943 in the principal western hemisphere countries was about 10,000,000 tons, which was 5.1% above 1942 and 14.4% above the average of the three prewar years. This increase in supply was mainly in the increased Cuban stocks, held back by shortage of shipping. Sugar production in the western hemisphere in 1943 as a whole was estimated at 6,900,000 tons or 14% less than 1942 but about 5% less than the three prewar years. The principal decline was in United States beet-sugar production and about an equal decline in the Cuban cane-sugar crop. (*See* also BEE-KEEPING; MAPLE PRODUCTS, RATIONING; SYRUP, SORGO AND CANE.) (J. C. Ms.)

Suicide Statistics. Mortality from suicide in the United States during 1943 was probably the lowest in two decades, according to current indications provided by the experience of the millions of industrial policyholders of the Metropolitan Life Insurance company. The final rate for 1943 was expected to be more than 10% under that of 1941 (the latest year of record by the bureau of the census), when there were 17,102 deaths and the death rate was 12.8 per 100,000 population. In 1942 Canada had 834 deaths from suicide, with a rate of 7.2 per 100,000, and England and Wales recorded 3,802 deaths, the rate being 9.2 per 100,000. Large towns in Germany had 7,647 deaths from suicide in 1942, almost 20% more than in 1939.

Considered geographically, mortality from suicide in 1941 in the United States was highest in the Pacific coast states, where the rate was 21.7 per 100,000. Following that, in descending order, were the mountain states, 16.4; east north central, 14.2; middle Atlantic, 13.6; west north central, 13.4; New England, 12.9; south Atlantic, 10.5; west south central, 8.9; and lowest, east south central, 7.9.

Death rates per 100,000 according to race and sex during 1941 were as follows (in each case, the first figure relates to males and the second to females): white, 20.7, 6.8; Negro, 5.7, 1.6; Indian, 9.3, 3.7; Chinese, 54.0, 9.9; Japanese, 41.7, 14.6; all other races, 25.4, 13.8.

The death rates per 100,000 from suicide among white males in 1941 ranged from 0.5 at ages 10 to 14, to a high of 66.5 at ages 75 and over. The rate for white females ranged from 0.3 at ages 10 to 14 to a maximum of almost 13 at ages from 45 to 59, the later ages showing lower rates.

A study of the United States death records for 1940 showed that contributory causes of death were mentioned in only one-fifth of the cases, or 3,631 out of a total of 18,957. In this group of 3,631 cases, mental diseases and deficiency were mentioned in two-fifths of the total, diseases of the circulatory system in one-fifth, intracranial lesions of vascular origin in one-tenth, with influenza and pneumonia, and diseases of the heart ranking next in importance.

In the July 1943 issue of the *Psychiatric Quarterly*, A. B. Siewers and E. Davidoff presented the results of a study of the characteristics of patients referred to a general hospital and to a psychopathic hospital because of attempted suicide. In the general hospital group, only one-fifth were suffering from psychoses, while nine-tenths of those in the psychopathic hospital group were so afflicted. Almost one-third of the persons in each group had some organic disease. The distribution of the two groups according to sex and marital status were very similar; about three-fifths were women and a like proportion were married. The average age of the females admitted to the general hospital was 30 years, and of those to the psychopathic hospital, 40 years. The authors state that the higher age of the latter group "corresponds closely to the age of onset of climacteric manifestations or involutional psychoses in females." Persons unemployed or unskilled were much more frequent in the general hospital group than in the psychopathic hospital group; skilled or professional persons were most frequent among the latter. The apparent motives for the attempt at suicide as stated by the patients were about the same for both groups.

Sulfonamide Drugs: *see* MEDICINE.

Sulphur. The production of sulphur in the United States in 1942 increased by 10% over 1941, to 3,460,362 long tons, while shipments decreased 8% to 3,132,408 tons. With the production rate maintained in the face of declining demand from Aug. 1942 to Feb. 1943, stocks at the mines rose to 5,114,486 tons at the year-end. During the second and third quarters of 1943, demand increased to figures greater than the production rate. Production during the first eight months of 1943 was 1,726,548 tons, shipments 1,970,050 tons, and stocks 4,815,220 tons.

Canada has no output of native sulphur, but the sulphur-bearing gases from roasting pyrite are utilized in the production of sulphuric acid, liquid sulphur dioxide and elemental sulphur. (G. A. Ro.)

Sumatra: *see* NETHERLANDS COLONIAL EMPIRE; NETHERLANDS INDIES.

Sunday Schools. No world's Sunday school convention was held after that at Oslo in 1936, which reported 369,510 Sunday schools in 129 countries, with 3,145,895 teachers and 34,139,624 pupils. This enrolment decreased because of the dislocations of war, and because Sunday schools were banned in countries under German control. Yet the Sunday schools have continued. "The Christian front in Norway is the hardest to conquer," the Quisling newspaper stated; and in that front were the teachers of the Norwegian Sunday schools. More young people were enrolled in classes for the training of Sunday school teachers in Sweden in 1943 than before the war. The Swedish Sunday School association aided Sunday school

work in Finland by sending literature for use in those schools. Literature for the French Sunday School union was being published in Switzerland and found its way monthly to the pastors and Sunday school workers in France. Sunday schools were maintained in Czechoslovakia, especially among Bohemians and Moravians.

The India Sunday School union appointed for the first time a native of India as its general secretary, in succession to a European missionary. In west China, the National Committee for Christian Religious Education found increased opportunities from its new headquarters at Chengtu. The National Sunday School union of England initiated a four-year advance program embracing the reorganization of local unions, an effort to enrol children who were not attending Sunday schools, and placing greater emphasis on teacher-training and educational evangelism.

The organization of the Latin American Union of Evangelical Youth was consummated through action taken by interdenominational youth organizations in 8 countries—Argentina, Bolivia, Chile, Colombia, Cuba, Mexico, Puerto Rico and Uruguay —which thus became its charter members.

The World's Sunday School association held a conference on Christian education for world order in May 1943, at Schwenksville, Pa., with delegates representing 20 countries. It launched a World Fellowship in Christian Education, to promote the systematic interchange of correspondence and information in this period when travel was sharply curtailed. While the president of the International Council of Religious Education, Lieutenant Commander Harold E. Stassen, former governor of Minnesota, was on duty in the United States navy, James L. Kraft of Chicago served as acting president. At its annual meeting this organization, which represented the Protestant churches of the United States and Canada, reported a total of 177,066 Sunday schools with 21,366,083 teachers and pupils. (*See* also CHURCH MEMBERSHIP.) (L. A. WE.)

Superphosphates.

The production of superphosphates in the United States in 1942 was 5,144,484 short tons of all grades, an increase of 19% over 1941. The sales of phosphate rock to producers of superphosphates totalled 3,631,812 short tons, an increase of 15% over 1941. (G. A. RO.)

Supreme Court of the United States.

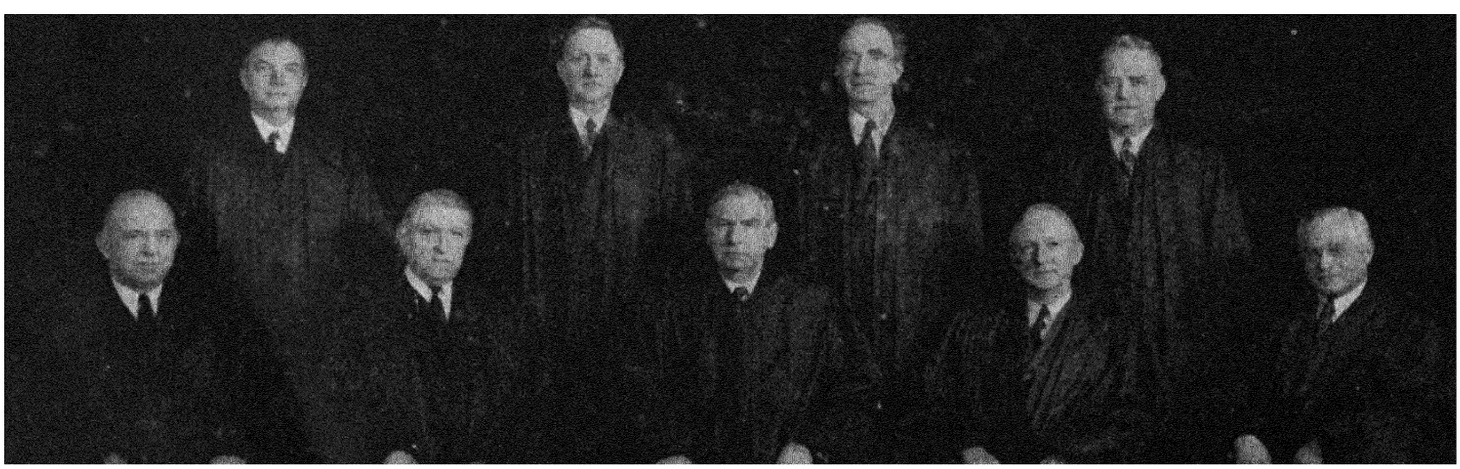
Personnel.—With the appointment of Wiley Blount Rutledge, the supreme court in 1943 was a court entirely nominated by President Roosevelt except for Justices Roberts and Stone, and the latter was nominated as Chief Justice by the president.

The latest incumbent of the high court, Wiley Blount Rutledge, associate justice of the U.S. court of appeals, Washington, D.C., was nominated, and confirmed by the senate on Feb. 8, 1943, to fill the vacancy left by James Francis Byrnes when the latter was made director of economic stabilization.

Issues.—The 1942–43 term of the U.S. supreme court was characterized by a great number of concurring opinions and more dissenting votes than at prior terms. The court overruled a number of precedents:

In the field of domestic relations law, its 36-year-old decision in *Haddock* v. *Haddock*, long a landmark in divorce law was rejected when the court held that a Nevada divorce is entitled to full faith and credit in all other states.

The court reversed itself in flag salute cases holding that states may not penalize conscientious refusal to salute the flag. The court distinguished between due process of law as applied to restraints upon property interests and due process applied to freedom of speech, press, assembly and ownership. In the case of property the test is whether the legislature had a rational ground for the restraint. In the case of persons freedom may not be restrained on such slender grounds.



It upheld claims of individual constitutional rights against a state's restriction through handbill ordinances prohibiting distribution of literature. The court restored "to their high constitutional position the liberties of itinerant evangelists who disseminate their religious beliefs and the tenets of their faith through the distribution of literature."

In considering the problem of interned citizens of Japanese ancestry, the court concluded that while as American citizens they were entitled to all the privileges, immunities and guarantees which are enjoyed under the constitution and statutes by other citizens of the United States, as a precaution against invasion and in view of the strategic importance of our west coast area their internment was deemed to be justifiable. Such use of preventive martial law was not deemed to be an unconstitutional taking of property.

The court refused to divest of citizenship one who was a member of the Communist party 12 years prior to the time when proceedings were initiated to cancel his citizenship.

The court greatly strengthened the hands of labour when it decided that picketing was permissible even though the representations made were untrue and disparaging. It was said that statements to the effect that the cafeterias' food was bad and that their patronage aided the cause of fascism was not sufficient to justify the granting of the injunction; that the "loose language or undefined slogans" were "part of the conventional give and take in our economic and political controversies" and did not constitute falsification of facts.

Further indicating the trend of labour law the court stressed the facts: that misconduct of a union did not disqualify it from filing charges with the Labor board that an employer engaged in

THE U.S. SUPREME COURT in 1943. Seated, left to right: Stanley F. Reed, Owen J. Roberts, Chief Justice Harlan F. Stone, Hugo L. Black, Felix Frankfurter. Standing: Robert H. Jackson, William O. Douglas, Frank Murphy, Wiley B. Rutledge, Jr.

unfair labour practices; that such misconduct did not deprive the board of jurisdiction to hear the case, although the board could consider such misconduct as material to its own decision to entertain and proceed upon the charge; that a backpay order of the board does not permit the employer to deduct from the wages due discharged employees the amount of benefits received by them under state unemployment compensation; that the board having found that an employer dominated an unaffiliated union could order the employer to reimburse employees for dues checked off their wages.

The profession of medicine found itself afoul of the law when the supreme court sustained the circuit court of appeals in finding that a concerted activity of the American Medical association and a local medical society against certain practitioners because of their group health association violated the Sherman Anti-Trust act. Even the sanctity of the press and the inviolate right of freedom of speech were not beyond attack, as was illustrated by the decision against the Associated Press.

Federal regulatory bodies were on the whole upheld: the Power commission in seeking enforcement of its orders against a public utility, the Communications commission in regulations pertaining to chain broadcasting as required in the "public interest, convenience or necessity," the National Labor Relations board in ordering reimbursement of dues paid to a company-dominated union, and the ICC in upholding an order authorizing railroads to discontinue loading charges.

In the 31 opinions handed down in the field of criminal law it sustained the constitutionality of the Federal Fire Arms act, upheld the conviction under the Harrison Narcotic act of manufacturing wholesalers for selling substantial amounts of morphine-sulphate tablets, and sustained an indictment charging one with impersonating an FBI officer. It held that tax evasion constituted a misdemeanour not a felony, and that one found guilty of contempt could not be sentenced to fine *and* imprisonment since the statute provides alternative punishment *i.e.*, fine *or* imprisonment only. The court also held that extra-judicial confessions of a defendant were not admissible against the accused and justified reversal of the conviction.

The court ruled that the Copyright act does not prevent an author from assigning his interest in a copyright renewal before he has secured it at the end of the original 28-year copyright grant. In determining that the Copyright act did not nullify an agreement by an author made during the original copyright terms to assign his renewal, Mr. Justice Frankfurter observed that it was not for the court to deny to authors the same freedom to dispose of their property as is enjoyed by others.

Statistics.—In the 1942–43 term there were 169 majority opinions disposing of 221 cases.

Number of Opinions, U.S. Supreme Court, 1942-43 Term

	Favourable to Government	*Against Government*
Federal tax cases	14	4
Federal labour cases	4*	2*
Federal regulation cases (other than labour)	11	4
Federal criminal cases (not including those arising out of war)	7	10
Federal war cases	3	2
Federal public contracts cases	4	
Federal miscellaneous cases	11*	6*
Total	54	28
State tax cases	3*	3*
State regulation cases	6	8
State criminal cases	2	3
Total	11	14
Total federal and state government cases (107)	65	42

*Rulings both for and against the federal or state government or in favour of one and against the other were entered in one opinion.

Affirmances and Reversals.—Decisions of courts below were affirmed in 44% of the cases decided by opinion. Affirmances were entered in 76 instances; reversals in 78 instances; and modification of the decision below in one case, the judgment below being affirmed as modified. In eight instances the court by opinion dismissed appeals or denied certiorari, and in seven cases no decision was entered on the merits of the case.

There were 165 dissents from a total of 70 majority opinions. The number of dissents were Stone 13, Roberts 28, Black 23, Reed 16, Frankfurter 18, Douglas 22, Murphy 26, Jackson 17, Rutledge 2.

There were fewer 5-to-4 decisions than in the previous term.

The court evolved a new type of dissent which became more accentuated in recent terms. Acts of congress were generally not overridden. The thought was that the supreme court justices must be statesmen as well as jurists and determine the direction of legislative growth rather than arrest it. The day of the major dissent appeared to have vanished.

A statistical summary of the court's work indicated: *Original Docket:* Total cases 15; cases disposed of 5; cases remaining 10.

Appellate Docket: Total cases 1,103; cases disposed of 992; cases remaining 111.

Totals: Total cases 1,118; cases disposed of 997; cases remaining 121. (*See* also LAW.) (B. WE.)

Surgery. The maintenance of blood supply to a tissue is as important as the maintenance of a supply line to an army and whenever either is stopped, disaster results. Many arms and legs are lost because the main artery supplying the part has been injured. Arthur H. Blakemore, Jere W. Lord and Paul L. Stefko showed that by using a vitallium tube lined by a vein, satisfactory repair of vessels can be made. Vitallium is a metal which produces no reaction in tissues. The tube is lined with a piece of vein, the ends of the vein being brought out over the end of the tube. The vein-lined tube is then tied into the defect in the artery. In this way the blood supply of the extremity is maintained. In order to improve the blood supply to the heart in patients who have had coronary thrombosis, Claude S. Beck, several years before, suggested methods which would increase the number of vessels supplying the heart muscle. He originally advocated a rather extensive procedure of placing a chest muscle on the heart muscle, but he showed also that many less extensive procedures resulting in the development of adhesions between the chest wall and the heart increased the blood supply to the heart muscle. Whereas, as shown in a report by Harold Feil, the immediate mortality is relatively high, those who survived the operation received definite benefit. In an attempt to increase the blood supply to the brain when this had been cut off by a haemorrhage or plugging, due to a clot, of the artery supplying that portion of the vein, Frederick E. Kredel suggested a procedure similar to that which was used by Beck, namely, the use of a flap of muscle placed against the brain which had been deprived of its blood supply, and in this way the paralysis and other symptoms resulting from a stroke were lessened or even obviated.

During 1943, considerable advances were made in the treatment of burns. It was shown quite definitely that tannic acid in the treatment of burns is undesirable, not only because it causes a crust under which infection can progress, but also because from an extensive burn surface there occurs sufficient absorption of tannic acid to produce severe liver damage, and in a number of fatal cases death was the result of the liver damage rather than of the burn. The administration of plasma in burns and the treatment of the burn as a wound, that is, by cleanliness, the prevention of infection, and the compression, remained the best methods of treatment. Sanford M. Rosenthal showed that there

is apparently a disturbance in the sodium balance in burns, because he showed that animals with severe burns could be kept alive by the administration of sodium chloride introduced intraperitoneally. Fox used this treatment in humans and found that by the administration of large amounts of sodium lactate by mouth to severely burned patients excellent results were obtained with a marked diminution in mortality.

Vitallium was used for a number of years as a metal which might be implanted in tissue; it was valuable because it produced little or no reaction. A new metal, tantalum, was suggested, which apparently has all of the advantages of vitallium, but does not have some of its disadvantages. Vitallium has to be cast to fit the part, but it has been possible with tantalum to cut, bend and hammer it, making it easier to use. O. H. Fulcher reported on the use of tantalum in the repair of skull defects and found it very valuable. Tantalum was also made into fine thread which was used for the repair of nerves, the advantage being that it produced no reaction and was, therefore, well tolerated by the tissues.

In the grafting of skin it is essential that the graft be maintained in close approximation to the defect until healing has occurred. Machteld E. Sano suggested using constituents of human blood as a cement substance to aid in this process. She took the extract from the white cells of the blood and painted this on the undersurface of the skin graft. The area to be grafted was painted with plasma and as soon as the graft was applied, it became firmly adhered. She reported excellent results with this treatment because the tissue extract and plasma form a medium for the growth of cells and actually stimulate healing. Lawrence W. Smith and Alfred E. Livingston showed that chlorophyll, which is the green colouring matter in plants, exerted a definite stimulating influence on the healing of wounds and that when compared with other substances used to stimulate wound healing, the other substances were practically without value.

Osteomyelitis, which is a severe systemic infection involving the blood stream but producing abscesses in the bone, claimed a high mortality rate. Robertson reported that excellent results were being obtained by treating the condition not only locally, when an abscess forms, but also by the administration of large doses of sulfonamides early in the condition. In this way the invasive properties of the infection could be controlled and much better results were obtained.

The control of haemorrhage from surfaces which ooze and which cannot be sutured is a real problem to many surgeons, particularly neurosurgeons. Although thrombin which is necessary for the clotting of blood is available and can be applied to the surface, it is difficult many times to maintain the thrombin in place for clotting to occur. If one used ordinary gauze, the clot became detached when the gauze was removed. Virginia K. Frantz prepared an oxidized cellulose which is absorbable and this was used by Tracy J. Putnam together with thrombin to control haemorrhage from bleeding brain surfaces. Since the oxidized cellulose is absorbable, it is not necessary to remove it after clotting has occurred and excellent results have been reported.

William Andrus, Lord and Stefko showed both experimentally and clinically that the acidity of the stomach was decreased when a pedicle graft of the jejunum, which is the upper part of the small intestine, is placed in the stomach. This is particularly important in patients with stomach ulcer in whom the recurrence of ulcers is due to the persistence of a high acid content. (*See* also ANAESTHESIA; INDUSTRIAL HEALTH; MEDICINE.)

(A. O.)

Surinam (DUTCH GUIANA). A Netherlands colony in northeastern South America. The area is 54,291 sq.mi.; the population, according to official estimates, was 177,980 in 1939. Around 45% of the population is East Indian in origin (26.8% British East Indians and 18.8% Javanese), the largest such proportion in the western hemisphere. The chief cities are Paramaribo, the capital (pop. 54,853), and Nieuw Nickerie (3,800). Government is under an appointed governor and a partially-elected council. The governor in 1943 was Dr. J. C. Kielstra (succeeded on Jan. 3, 1944, by J. C. Brons, acting governor).

History.—With the decline of the axis submarine menace in western Atlantic and Caribbean waters, trade conditions eased and shortages became less acute. Meanwhile, bauxite mining activity and presence of United States troops in Surinam provided economic stimuli. The former, however, was expected to decline somewhat as a result of huge United Nations stock piles, with consequent effects on the colony.

Surinam was visited in November by Crown Princess Juliana of the Netherlands, first of the royal house of Orange ever to

NATIVE WOMEN of Surinam, members of the Dutch colonial army auxiliary, parading in 1943

come to the colony. Earlier in the year a Surinam economic mission visited Brazil; the first Brazilian consul ever accredited to the colony arrived at Paramaribo on May 13.

On Oct. 25, Gov. Kielstra celebrated his tenth anniversary as governor. Shortly thereafter it was announced that he would retire on Jan. 3 to become Netherlands minister to Mexico. His incumbency had been marked by sharp change in the colony's fiscal condition, from a budget of 7,000,000 guilders, 3,000,000 of which was met by a home government subsidy, to one of 13,500,000 guilders, raised entirely from the colony's own resources. Local government had been reorganized, a strong military force built up, and many social reforms introduced.

On Aug. 3, Surinam's first daily newspaper, *Het Nieuws*, began publication.

Education.—Surinam had, in 1943, 114 elementary schools (44 of them public), with nearly 22,000 enrolment, over half in Paramaribo, and four secondary schools. In addition there were 33 schools for bush Negroes and Indians in the interior.

Finance.—The monetary unit is the guilder (value approx. 53¢ U.S.). During 1943 the colony was faced by an acute shortage of subsidiary coins, which was relieved by assistance from the United States mint.

Trade.—The basic exports are mineral. Bauxite, first developed in 1922, dominated in 1943. In 1941, 1,093,764 tons of bauxite were exported, practically all to the United States, nearly double prewar totals. Exports in 1942 and 1943 were unofficially reported to be greater. Gold, whose production is no longer reported, was the second export. Agricultural exports included sugar, coffee and rice. Some balata was exported. Exports in 1941, the latest available, were 11,398,377 guilders value, of which 93.4% went to the United States, 4.2% to Great Britain. Imports were 9,429,922 guilders value, the United States supplying 71.9%, Trinidad 5.4%, Argentina 4.6%, and Great Britain 4.2%. The Netherlands supplied about 50% of prewar imports. The principal imports are manufactures and foodstuffs.

Communication.—External communication is by steamship and air. Pan American Airways and "KLM" (Royal Netherlands Airways) maintain regular air transport service. There were 8 mi. of railway in 1943 and fairly good roads along the coast. Interior communication is entirely by trails and navigable rivers.

Resources.—Sugar was once the main economic basis, but has steadily declined in importance. Normal production is around 9,000 to 10,000 tons. Annual production of first quality coffee approximates 9,000 bags (of 132 lb.). Considerable low grade is also produced. Bananas, cacao, rice, coco-nuts and citrus fruits are also cultivated. Export of orange juice and pulp is on the increase.

Bauxite, the main mineral resource, is increasing in importance. In 1940 it provided 87% of all export values against 35% in 1935 (*see* above). Gold production averages around 400,000 grams a year.

The interior forests contain many valuable unexploited hardwoods. Balata is gathered in appreciable quantities. During 1943 surveys were made of the colony's rubber resources.

Sweden. A democratic monarchy of northern Europe. Area, 173,341 sq.mi.; pop. (est. 1940) 6,370,538. Capital, Stockholm (est. [1943] 615,975). Other principal cities, with populations (1943), are Göteborg (Gothenburg) (285,732), Malmö (159,708), Norrköping (72,039), Hälsingborg (63,250). Religion, Lutheran Christian. Ruler in 1943: King Gustavus V (*q.v.*); prime minister: Per Albin Hansson.

History.—On Jan. 18, 1943, Premier Per Albin Hansson not only announced again that Sweden would resist any invasion but declared that if invasion came Swedes should pay no attention to any orders to cease firing. This stiffening tone was the keynote of Swedish policy and action through the year.

The reasons for this change from earlier policy were many. Partly, no doubt, the stronger tone was due to events like the Russian advance and the Allied landing in North Africa. Partly, it was due to the strengthening of Sweden herself. In 1943 Sweden had 26 destroyers actually in service; 70 naval vessels had been added since 1939, plus 140 merchant vessels, and the Göta-Verken and other shipbuilding establishments were still busy. In December Gen. Helge Jung painted a very encouraging picture of Swedish powers of self-defense. Industry had to a very large extent adapted itself to the production of nonimportable essentials. The food situation was somewhat improved. Despite the long-standing lack of fodder and a poor hay crop in 1943, the livestock census showed 200,000 more cattle and 130,000 more pigs. Eighty-four thousand acres were used to produce oleaginous plants, greatly aiding the edible fat situation.

Toward Germany people, press and government became increasingly hostile. In the trade negotiations with Germany even the temporary credits formerly granted were refused. The nazis sent Hans Thomsen, former chargé d'affaires in Washington, as minister to Sweden in Feb. 1943 to try to develop better relations. But the Swedish government ruled that two armed Norwegian merchant vessels laid up at Gothenburg might leave if they wished, and Germany at once retaliated by cutting off her permission for the Swedish safe-conduct ships to and from the Americas. The loss of a Swedish submarine, "Ulven," probably by hitting a mine, and the firing on another submarine, "Draken," by a German ship, inflamed Swedish opinion and brought a stiff protest by the government. The German reply was not very satisfactory, but in May the safe-conduct traffic was again allowed (but was cut off again on Oct. 28). The Swedes totalled their sea losses since 1939 to 167 merchant ships with a gross tonnage of 482,576, and lives numbering 1,133. New incidents continued to occur, such as the attack on two fishing boats off the Danish coast on Aug. 25, and the shooting down of a passenger plane from Britain on Oct. 22 ("Gripen"). Beginning in August the government took action which the people had been demanding for months: On Aug. 15 the transportation of war materials for the Germans to Norway and Finland on Swedish railways was stopped; on Aug. 20 the leave transit of German troops and the use of Swedish lines for transit between Trondhjem and Narvik was forbidden; and on Oct. 1 the transportation of German oil through Sweden was ended.

Sentiment in Sweden was affected not only by incidents involving her own people, but by the increasing severity of German activities in Denmark and Norway. When on Aug. 29 the Germans took over direct control in Denmark and a month later started to round up the Jews there, the Swedish government protested vigorously and offered asylum to all the hunted people. The Germans did not appreciate this neighbourly intervention, but more than 8,000 Danes escaped to Sweden, largely children and old people. An organization was quickly established in Sweden providing homes for all and jobs for as many as possible.

The arrest and threatened deportation to Germany of 1,200 students of the University of Oslo further inflamed Swedish opinion. German Foreign Minister Joachim von Ribbentrop returned a curt reply to the Swedish protest, refusing to discuss it

and telling Sweden to cease interference with German affairs. The Swedish reply to this was a warning that continuance of German policy would result in increasing deterioration in Swedish-German relations.

Neutrality showed some of its advantages when Gothenburg became the exchange port for some 842 totally disabled German war prisoners and 5,175 British. Sweden was host to about 50,000 foreigners, including some 20,000 Finnish children and 8,000 Danish refugees.

Sweden did much thinking and planning for the postwar world. Her shipyards built ships which could not run till the war was over, and plants were expanded in the wood pulp, iron ore and steel industries. New air routes were planned. But repeatedly press and leaders expressed the responsibility of neutral Sweden to give aid after the war for the reconstruction of her neighbours' industry and commerce. On Oct. 18 the minister of finance, Ernst Wigforss, asked the riksdag for an initial appropriation of 100,000,000 kr. for direct aid in food and other necessities to the needy after the war—precedence to be given to Sweden's own northern people.

Education.—In 1937–38 there were 567,579 pupils and 27,858 teachers in the elementary schools and 90,087 students in secondary schools. In the five universities, 7,606 students were enrolled in 1940. Sweden's budget for educational expenses in 1941–42 was 256,387,000 kr.

Finance and Banking.—The monetary unit is the krona (26 U.S. cents at par, 23.94 cents on Nov. 8, 1941). The fiscal year ending in June 1942 left a government deficit of 2,205,000,000 kr. National income was about 12,000,000,000 kr., of which about 5,000,000,000 kr. went into state and municipal taxes. The national debt Aug. 31, 1943, was 9,125,000,000 kr., more than double that of three years earlier. In 1940 there were 28 private banks with deposits of 4,793,477,000 kr. Gold reserves in Dec. 1942 reached an all-time record of 1,404,000,000 kr. ($351,000,000).

Trade.—The two notable things about Swedish trade, both natural wartime phenomena for a country so situated, were the decline in total commerce and the increased share of Germany in that trade: from 25% of Sweden's imports in 1939 to 46% in 1942, and from 19.5% of Sweden's exports in 1939 to 40% in 1942.

Because of the difficulties of obtaining coal (for Germany could not maintain promised deliveries), the Swedes like the Danes began cutting peat on a large scale; 1942 production was 700,000 tons. Industrial use of coal was cut from 250,000 tons per month to 50,000 tons per month, and crude oil consumption went to almost zero. Automobiles burned "producer-gas," supplied from 10,463,600 cu.yd. of wood annually. Water supply for power production was increased from 1,800,000,000 kw.h. in 1939 to 2,800,000,000 kw.h. in 1943.

Communication.—On Dec. 31, 1940, there were 10,231 mi. of railroads. By 1943 railway electrification served half the trackage and 85% of freight volume. In 1939 there were 53,787 mi. of highways, practically all listed as "improved." Motor vehicles licensed (Dec. 1940) numbered 81,334. Airways (1939) flew 1,536,000 mi. and carried 60,000 passengers. Telephones (Dec. 31, 1941) numbered 980,000 (about 150 per 1,000 persons), putting Sweden second only to the U.S. in the per capita ratio of telephones. Telegraph mileage was 11,040. There were 1,470,375 licensed radio sets and 35 broadcasting stations. The Swedish merchant marine consisted of 1,605,000 gross tons in 1938.

Table I.—*Sweden's Imports 1939-1942 By Commodity Groups*

Commodity Groups	1939		1940		1941		1942	
	*Kr.	%	*Kr.	%	*Kr.	%	*Kr.	%

*Value in millions of kronor. (*Sweden, A Wartime Survey*, p. 90.)

Agriculture.—In 1942 the bread-grain harvest, still 10% below normal, was almost double the 1941 crop. Fodder was 13% below normal, but provided for a 4,000,000-ton milk production, for cheese production at the existing rate and for a butter increase of 16% to about 95,000 tons. Egg production was about 60% of the 10-year average, and meat also about 60%. The potato harvest of 1942 was above normal, as were the sugar-beet and pea crops.

Manufacturing.—The total value of production in 1939 was 8,151,768,000 kr. There were 644,360 workers in 19,092 establishments. The chief manufactures were machinery and metal, 2,518,576,000 kr.; wood and paper, 1,489,655,000 kr.; foods, 1,395,787,000 kr.; clothing and textiles, 801,799,000 kr.; chemicals, 392,569,000 kr.; electrical equipment, 302,984,000 kr.; beverages, 230,845,000 kr.; stone, etc., 229,054,000 kr.; and leather, 228,717,000 kr.

Mineral Production.—Production of the leading minerals in 1939 was as follows: iron ore, 15,197,633 tons; iron and steel, 1,300,900 tons; cast iron, 709,923 tons; coal, 489,085 tons; arsenic ore, 267,065 tons; sulphur pyrites, 211,352 tons; fireclay, 153,168 tons. Silver production amounted to 7,226,855 oz.; gold, 2,149,220 oz.

Swimming.

Increased effort on the part of belligerent nations to provide schooling in watermanship for service men and women made of 1943 a year of notable progress in swimming. Competitive swimming and water polo were curtailed in the open field because of the war, but they gained greater favour than ever as features of the athletic and recreational activities at service training stations and, whenever possible, behind the many fronts.

World's records continued to fall and it deserves mention that the feats achieved bettered not only the listed marks but also those claimed since the *Federation Internationale de Natation Amateur*, in charge of the supervision of world's standards, ceased to function at the start of hostilities.

Swimmers of the United States turned in six of the new records and of chief interest was the exploit of Alan Ford, a college freshman, in covering 100 yd. free style in 50.7 sec., a performance which clipped the oldest record on the international table, John Weissmuller's of 51 sec., set in 1927. Ford also helped Richard Baribault, Brewster Macfadden and Richard Lyon, his Yale uni-

A 16-YEAR SWIMMING RECORD fell Jan. 30, 1943, when Alan Ford of Yale university swam the 100-yd. free style in 50.7 sec., breaking the mark of 51 sec. set in 1927 by Johnny Weissmuller. Ford is shown in a practice swim, using a mirror to detect flaws in his stroke

versity fellow students, to lower the time for the 400 yd. relay to 3 min. 26.2 sec.

Harry Holiday shaded the back stroke figures for 100 yd. to 57 sec. and 200 m. to 2 min. 22.9 sec., while Emmett Cashin cut the breast stroke marks for 200 yd. to 2 min. 19 sec. and 200 m. to 2 min. 33.7 sec., but the national committee withheld recognition of the latter feats pending further investigation.

The European Swimming league announced its acceptance of a string of European records, four of which rate as world's best also. Denmark's famous ace, Ragnhilde Hveger, who held all but 2 of the 15 free-style standards registered for women, surprised by slashing the time for 400 m. back stroke to 5 min. 38.2 sec. Anna Kappel, of Germany, brought down the breast stroke records for 400 m. to 6 min. 8.2 sec. and 500 m. to 7 min. 43.4 sec. Artem Nakache, of France, lowered the men's breast stroke mark for 200 m. to 2 min. 36.7 sec., but the fate of his achievement obviously would depend on whether or not Cashin's quoted performance in 2 min. 33.7 sec. was recognized.

Leonid Meskov, of the Russian army, equalled the record of 5 min. 43.8 sec. for 400 m. breast stroke. The soviet union, however, was not affiliated with the F.I.N.A., so Meskov's effort did not qualify. (L. DE B. H.)

Switzerland. A republican confederation of 22 cantons of west-central Europe, bounded N. and E. by Germany, S. by Italy and W. by France. Flag, white cross on red background. Area 15,944 sq.mi.; pop. (1941 census) 4,260,179. Chief towns: Berne (cap. 129,331), Zürich (333,829), Basle (161,380), Geneva (124,442), Lausanne (92,000). Languages (census 1930): German 2,924,314; French 831,100; Italian 242,034; Romansch 44,204 and others 24,797. President (Jan. 1, 1944) Dr. Walter Stampfli.

History.—Switzerland was still able in 1943 to maintain her position as a haven of comparative peace and security in the midst of a war-torn Europe. But her political and economic position was very difficult. Constantly threatened by Germany, surrounded on all sides by axis territory, and dependent on Germany for coal and other raw materials, Switzerland was compelled to pay high prices for her imports and to sell her food and machinery to Germany at low prices. This caused a constantly unfavourable balance of trade for the Swiss.

After the United States and many other American states went to war with the axis powers in the winter of 1941–42, the Swiss government consented to assume the burden of looking after their diplomatic interests, in addition to representing numerous other countries already at war. Switzerland also became the great centre for the work of the Red Cross in arranging the exchange of prisoners.

Education.—Managed locally by the cantons and communities, education is obligatory and free. In 1939–40 the pupils in primary schools numbered 455,561, and those in secondary and middle schools 73,422, in addition to various cantonal and technical schools. The seven universities (Basle, Zürich, Berne, Geneva, Lausanne, Fribourg and Neuchâtel) had a total of 9,649 matriculated students in the winter of 1940–41.

Finance.—The franc, the Swiss monetary unit, was devalued about 30% in 1936, so that it contained about 200 mg. of fine gold and had in 1942 an exchange value of 23.40 U.S. cents. The budget estimates for 1941 were 517,700,000 francs of revenue, and 592,300,000 francs of expenditure, and the total debt, including railway debt, was 6,130,656,000 francs.

Trade and Communications.—Imports and exports in 1942 were 2,071,000,000 francs and 1,595,000,000 francs respectively. Swiss railways, 3,218 mi. in length, carried 23,300,000 metric tons of freight and 144,000,000 passengers. There were, in 1943, three main and three local broadcasting stations. (S. B. F.)

Syria. An independent republic, formerly French mandated territory, bordering the eastern Mediterranean. Area, 73,587 sq.mi.; pop. (est.) 2,800,000; chief town: Damascus (cap. 225,000). President (1943): Shukri al Quwatli. Language: Arabic; religion: mainly Mohammedan.

History.—The president, Sheikh Mohamed Tageddine el Hassani, died Jan. 17, 1943. A new government was reported on March 26 with Atta Ayubi as prime minister. Powers were granted in January to General Georges Catroux, Fighting French delegate-general, to re-establish a constitutional regime and to hold parliamentary elections. Jean Helleu was appointed as his successor in June. The primary elections were held on July 10 and the secondary on July 26. The chamber of deputies, which numbered 124, elected Shukri al Quwatli president. The new ministry was composed of seven Sunni Moslems and one Greek Orthodox Christian. Faris Alkhuri was elected president of the chamber. On Nov. 28, the foreign affairs committee urged that Article 16 of the constitution, giving special powers to the French, should be abolished and control secured over public security, customs and the army. Yves Chataigneau's appointment as delegate-general was announced on Nov. 22. Currency in circulation at the end of March 1943 was £ Syrian 101,000,000 and by May the gold pound had risen from 45 to 70 Syrian pounds.

The following statistics refer to Syria and Lebanon jointly:

Finance.—Monetary unit, the Syrian pound (divided into 100 piastres). Revenue 1938 (at the rate of 20 francs = one Syrian pound) 588,787,596 francs. Expenditures 509,085,433 francs. Notes in circulation (June 30, 1939) £ Syrian 35,600,000; reserves (June 30, 1939), gold £ Syrian 3,500,000, foreign assets £ Syrian 31,800,000.

Trade and Communication.—Imports (1940) £ Syrian 57,000,000; (1941) £ Syrian 38,000,000; exports (1940) £ Syrian 19,000,000; (1941) £ Syrian 11,000,000. Roads (1939) *c.* 1,900 mi.; railways (1939) 890 mi.

Agriculture.—(1940) short tons; wheat 737,990; barley 424,385; maize (1938) 30,312; oats (1939) 5,950; potatoes (1938) 45,855; tobacco (1938) 3,748; wine (1938) 1,136,000 gal.; cotton 7,165; cotton seed 16,645; sesamum (1938) 5,842; olive oil 14,330; wool (1938) 10,913; raw silk 220.

Syrup, Sorgo and Cane.

The United States production of sugar cane syrup in 1943 was estimated by the U.S. department of agriculture at 19,240,000 gal., somewhat more than either 1941 or 1942, though less than

Table I.—*U.S. Production of Cane Syrup by States, 1943 and 1942*

State	1943 gal.	1942 gal.	State	1943 gal.	1942 gal.
Louisiana	5,640,000	5,760,000	Florida	2,040,000	1,760,000
Georgia	4,250,000	3,900,000	Texas	700,000	665,000
Mississippi	2,092,000	3,300,000	South Carolina	648,000	485,000
Alabama	2,875,000	2,645,000	Arkansas	95,000	95,000

Table II.—*U.S. Production of Sorgo Syrup in Leading States, 1943 and 1942*

State	1943 gal.	1942 gal.	State	1943 gal.	1942 gal.
Alabama	2,048,000	1,767,000	Tennessee	1,230,000	1,134,000
Mississippi	1,495,000	1,800,000	North Carolina	730,000	1,065,000
Georgia	1,320,000	1,220,000	Arkansas	722,000	1,155,000

the average of 20,818,000 gal. for the period 1932–41. The production of sorgo syrup in 1943 at 11,760,000 gal. was about 2,000,000 gal. below 1942 and only 81% of the 10-year average. (*See* also BEE-KEEPING; MAPLE PRODUCTS.) (J. C. Ms.)

Table Tennis.

Paradoxically the war, which continued to handicap organized table tennis in 1943, promised to give it a postwar fillip through the world-wide distribution of star players among the armed forces and introduction of the game in virgin territory. Two examples, somewhat fantastic, were a U.S. army private playing singles with the shah of Iran in the latter's palace, and Australian troops teaching the game to "fuzzy-wuzzies" on a South sea isle. With cancellation of the world championships for the fourth consecutive year, the U.S. championships were of prime importance. Petty Officer William Holzrichter, U.S. navy, won the men's singles; Sergeant Laszlo Bellak and Private Tibor Hoffmann (Hazi), two former Hungarians who joined the U.S. army, the men's doubles; and Sally Green, the women's singles for the fourth straight year. The U.S. Table Tennis association recognized the game's growing appeal among youth by establishing a junior boys' singles event. (C. Z.)

Taft, Helen Herron

(MRS. WILLIAM HOWARD TAFT) (1861–1943), widow of the former U.S. president and chief justice, was born June 2 in Cincinnati, O. She was educated in public schools in Cincinnati and taught school there for several years. She was married to Mr. Taft in 1886 and four years later accompanied him to the Philippines where he served as governor. Mrs. Taft, who has been credited with planning her husband's public career, advised him against accepting a seat on the supreme court bench offered to him by President Theodore Roosevelt in 1903 on grounds that it would mar his chances as presidential candidate. During the time she was First Lady, Mrs. Taft instituted many changes in White House management and had planted the famous cherry trees in the vicinity of the Washington monument. A talented musician, she founded the Cincinnati Symphony orchestra in 1896 and was at one time president of the organization. She died at her home in Washington, May 22.

Talc.

The record sales of 416,369 short tons of talc and related minerals produced in the United States in 1941 declined by 7% in 1942, when a total of 387,963 tons was reached. The bulk of this total was ground talc. Increases in use were made in paint, roofing and insecticides, all other uses showed declines. Canadian production included 15,499 tons of talc and 14,369 tons of soapstone. (G. A. Ro.)

Tanks, Military: *see* MUNITIONS OF WAR; WORLD WAR II.

Tariffs.

In 1943, as in 1941 and 1942, war dominated the field of tariffs as it did all other fields of activity. There were many tariff reductions in 1943, particularly in Canada, in Central and South America, and in the colonies. Sharp reductions and transfers to the free list prevailed. But most of them were limited—either the duty was suspended, not repealed, or the imports had to be made by a state agency or they were limited seasonally or by quotas, or they were restricted to specific uses—for example, making containers for exporting the produce of the country. Some related explicitly to war shortages and were limited to the duration of the war or to the duration of the shortage. Costa Rica published an extensive list of duty decreases (and also increases) on Nov. 21, but the decreases were not to become effective until Jan. 1, 1944. Paraguay reduced its ad valorem rates in October in order to prevent an increase in duty expressed in a new currency unit.

Decrees or laws increasing tariff rates were somewhat less numerous than those giving decreases or exemptions, but they seemed likely to endure longer. Most of them were intended to raise revenue rather than to shelter domestic industries, although the latter type was not absent. Liquors, tobacco and "luxuries" were prominent in the particularized increases, but several countries imposed or increased the rates of surtaxes, sales taxes, or other charges affecting most of their imports. Uruguay raised official values by 30%. Paraguay more than trebled the additional charges on imports by raising the ad valorem charge from 7% to 15% and changing the conversion ratio. Costa Rica raised duties on a long list of luxuries and also doubled the surtax (from 5% to 10% of duty) and made it applicable to all products not bound by trade agreements. Chile raised her additional tax on "dispensable" products from 10% to 15% of duty-paid value. Turkey increased her sales tax on most domestic and imported products from 12½% to 15% ad valorem. Egypt doubled her specific duties of 1941.

Mexico on Dec. 18 decreed many increases in duties and a few decreases, the changes to become effective Jan. 17, 1944. Some rates were only slightly increased but others were raised by a third or a half or even doubled. The United States department of commerce summarized the changes in three pages.

Changes in export duties were relatively few. Several decreases were reported and a larger number of increases, as always occurs with rising prices. Madagascar's war tax illustrated the progressive type of export duty, the rate being 3% of the amount by which the value of a commodity exceeds the official value fixed for the third quarter of 1939. El Salvador increased the export duty on coffee from 43 cents to $1.25 per 100 lb. and provided for an annual adjustment according to prices during the last 15 days of October. The higher export duty took the place of other taxes, including certain income taxes. Tunisia developed a novelty—retroactive export taxes. That on wool carpets and rugs (100 or 160 francs per net kilogram) was pub-

lished Jan. 7, 1943, but retroactive from Dec. 6, 1941. Most of the export duties were imposed or raised in order to collect more revenue, but numerous embargoes were imposed to reserve supplies for domestic use so that the burden of shortage rested on foreign countries. Cuba, however, restricted domestic consumption of beef so as to make a greater contribution to the war.

European countries continued to make and remake (sometimes every six months) barter and compensation agreements indicating the classes of goods and the quantities or values to be exchanged—the total trade usually to be carefully balanced.

The American countries continued to exchange most-favoured-nation pledges and to make agreements for tariff reductions. The United States on Jan. 1 and Jan. 30, 1943, put into effect its trade agreements with Uruguay and with Mexico, and on Nov. 19 with Iceland. The trade agreement of April 8, 1943, with Iran, however, had not been ratified by Iran at the end of the year. Negotiations with Bolivia and with Paraguay had been announced, but since then there was a change of government in Bolivia.

Colombia and Ecuador expanded the list of concessions made by their agreement of July 1942. Paraguay exchanged a few concessions with Brazil, and on Nov. 17, 1943, signed trade and financial treaties with Argentina covering all aspects of commercial and financial relations and stipulating many tariff concessions on both sides. Argentina agreed with Chile for ten years to buy only natural sodium nitrate and not to construct a synthetic nitric acid plant.

Of potentially much greater significance than the new concessions exchanged among American countries was the disposition to consider closer future relations including customs unions. Argentina and Chile agreed on Aug. 24 to appoint a mixed commission to report within a year on possible bases of a customs union. "This customs union will be open to the adherence of any neighbouring country and will constitute a first step toward a continental economic organization including the reduction or the abolition of customs barriers" according to a declaration of the two governments. Likewise, Chile and Peru proposed to establish commissions to study possible free trade between them, and Chile and Brazil agreed on a permanent mixed commission to stimulate production and trade.

Chile, on Feb. 10, 1943, ratified the treaty of Oct. 17, 1941, by which Chile and Peru exchanged tariff concessions, and the two governments declared in a protocol their intention to maintain the exclusive character of these concessions. On March 1, Chile signed a most-favoured-nation treaty with Brazil, as had been done the year previously with Mexico (proclaimed by the Mexican government April 30, 1943). Both of these treaties excepted from the pledge of equal treatment the special treatment that might be accorded to a neighbouring state or which might be accorded to a partner in a customs union. But both Mexico and Brazil accepted this exception only with a list of exceptions to the exception, that is, lists of products in which they were respectively especially interested, which should always receive in Chile the treatment of the most-favoured-nation, whether or not that nation was in customs union with Chile.

A contrary tendency may be noted. Haiti denounced the preferential customs treaty of 1941 with the Dominican Republic so that it was to expire on March 8, 1944, and Guatemala announced that the free trade agreement of 1941 with El Salvador would not be extended beyond its initial term ending Nov. 6, 1943. (*See* also INTERNATIONAL TRADE.) (B. B. W.)

Tasmania. A state of the Australian commonwealth, forming an island 26,215 sq.mi. in area to the southeast of the mainland, from which it is separated by 140 mi. of Bass strait. Pop. (est. Dec. 1941) 241,171. Chief cities: Hobart (cap., 66,620); Launceston (33,250). Governor (1943): Sir Ernest Clark.

History.—The premier, R. Cosgrove, twice introduced a bill to grant wider powers to the federal government for a limited period after the war, but on each occasion the bill was rejected by the legislative council after having been passed by the lower house.

Tasmania's large prewar fresh apple export trade was largely replaced by the manufacture of apple juice for the services. More than 1,000,000 gallons were supplied during 1943. The federal government decided to establish an aluminum ingot industry based on Tasmanian and Victorian bauxite deposits.

The postwar reconstruction committee's plans for housing, water and sewerage, hydroelectric extensions and reafforestation to cost £A.9,000,000 were approved by the cabinet.

Education.—In 1939: state primary schools 420; average daily attendance 25,538; state high schools 5; average attendance 1,783.

Finance.—Revenue (1940–41), £A.2,920,000; expenditure £A.3,110,000; public debt (June 30, 1942), £A.28,737,000.

Communication.—Roads (1940) 9,386 mi.; railways: government (Dec. 1942), 642 mi.; private, 132 mi. Motor vehicles licensed (March 31, 1943): cars 15,703; trucks 5,505; cycles 2,442. Wireless receiving set licences (March 31, 1943) 49,030. Telephones (June 30, 1941) 19,565.

Manufacturing.—Production 1939–40: primary £A.8,185,110; secondary £A.6,253,029. Labour 1941–42 average: factory employment, 17,556 employees; unemployment (March 1943) 1.3%.

(W. D. MA.)

Taxation. **United States.**—Employers in the United States became tax collectors on a grand scale in July 1943, when the pay-as-you-earn scheme of harvesting the bumper crop of tax dollars was put into effect by the government.

Under the revolutionary provisions of the Current Tax Payment act of 1943, signed by President Roosevelt on June 9, a 20% withholding of taxable income at source became effective July 1 for all wage and salary earners. Employers, who had been given a few years of experience in tax collection technique through the small percentage withheld from wages and salaries under the Social Security act, were now charged with collecting and remitting to the treasury's designated depositaries the bulk of revenue due from individual taxpayers.

The transition to pay-as-you-earn was accomplished with comparatively little disturbance to the economic equilibrium of the nation. Yet, 1943 as a whole was a year of tax turmoil. Generally speaking, the public was confused by the complexities of the tax situation. Millions more citizens had become "tax conscious" through the withholding from wages of the 5% Victory tax during the first half of the year but they found it difficult to comprehend the workings of the tax abatement clause and other features of the Current Tax Payment act.

Congress found practically no surcease from the gruelling task of revising the revenue code. Consideration of the withholding tax legislation extended over the first five months of the year, and scarcely had the ink of the president's signature dried on that historic document than treasury plans were being discussed for a second major tax law—this one designed to raise additional revenue (effective on income received in the calendar year 1944) of between $10,000,000,000 and $12,000,000,000 a year. Furthermore, bills were introduced in congress to boost social security tax rates to 6% each on employee and employer, thus raising an annual sum estimated at more than $12,000,000,000, most of which would be immediately available for general purposes. However, on Dec. 16, 1943, congress froze existing social security rates at 1% each on employer and employee until March 1, 1944.

On Oct. 3, the treasury recommended to congress additional taxes of $10,500,000,000, of which $6,500,000,000 would come out of the pockets of individuals. The plan contemplated repeal of the 5% Victory tax, which would free about 9,000,000 persons from income tax payments; repeal of the 10% earned income credit; reduction in exemptions of individuals; sharp increase in surtax rates applicable to both individuals and corporations; graduation of rates of withholding tax so as to collect substantially the full liability in the higher salary and wage brackets; increase in estate and gift tax rates and reduction of exemptions; and increase in excise tax rates all along the line. Congress received these proposals coldly, and 1943 ended with new tax legislation still the subject of debate.

The house of representatives on Nov. 23, 1943, passed a bill to add approximately $2,142,000,000 to federal taxes, making only minor changes in rates, except those applying to excise taxes on toilet preparations, liquors, transportation tickets, communication services and luxury items generally. On Dec. 23, the senate finance committee reported a measure designed to raise $2,300,000,000 in new taxes, which the committee estimated would bring total revenue over a full year's time up to $43,600,000,000. With congress in holiday recess, action on the bill had not been taken by the end of 1943.

"Pay-as-you-earn" System.—The Current Tax Payment act of 1943, as its title implies, provided new machinery for the collection of U.S. federal income taxes. It was not a new *tax* law in the sense of revising existing rates, but it instituted the most radical changes in the income tax situation made in more than a quarter of a century. Moreover, it was regarded as a *permanent* change —not to be classed in the category of a war emergency measure as so many revisions in the tax structure of the United States had been since 1939.

The outstanding feature of the new law was the provision compelling employers to withhold 20% of wages and salaries, after specified exemptions reflecting the family status, from pay roll checks, and to deposit such withheld sums to the credit of the government in local banks designated as depositaries. The 20% deduction from pay rolls represented the normal income tax of 17% and 3% of the Victory tax. The 5% Victory tax imposed under the Revenue act of 1942 was not repealed, but only 3% was collected currently after July 1, 1943, on the theory that the remaining 2%, due March 15, 1944, probably would be cancelled out by refunds to be granted for purchases of war bonds, payment of life insurance premiums, or reduction of personal indebtedness, as provided in the 1942 act.

A provision requiring employers to pay all withheld taxes into the depositaries within ten days after the close of each calendar month enabled the treasury to come into quick possession of these taxes. Employers were compelled also to file quarterly reports of such payments with the collector of internal revenue, accompanied by depositary receipts for the full amount of taxes withheld. A prodigious amount of additional bookkeeping was thus imposed on employers.

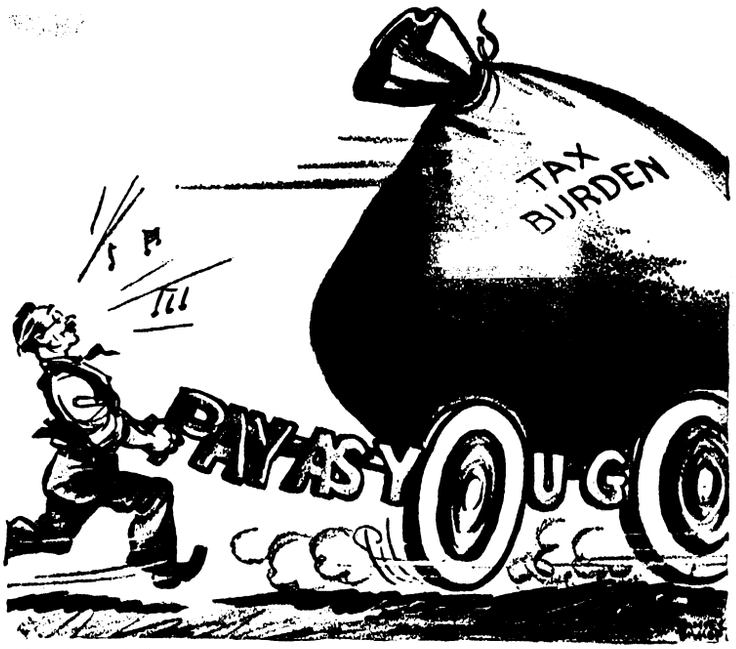
Withholding Exemptions.—Employees were charged with the responsibility of filing exemption certificates with employers. For withholding purposes, exemption allowances were fixed in tables included in the Current Tax Payment act, as in Table I.

In no event shall the tax to be withheld be less than 3% of the excess of each wage payment over an exemption determined in accordance with the following schedule:

Victory Tax Withholding Exemption Schedule

Pay roll period	*Withholding exemption*
Weekly	$12.00
Biweekly	24.00
Semimonthly	26.00
Monthly	52.00
Quarterly	156.00
Semiannual	312.00
Annual	624.00
Daily or miscellaneous (per day of such period)	1.70

Relief for Armed Forces.—Excluded from the withholding provisions were members of the armed forces, farm workers, casual labourers, domestic help, ministers of the gospel and services by nonresident aliens. Members of the armed forces also received a special exemption of $1,500 on base pay, in addition to regular exemptions allowed civilians under the 1942 revenue act.



Employers were given the option of computing the exact amount of tax to be withheld from the pay of each employee as provided by the intricate terms of the law, or of using the figures set out in tables shown in the statute for various wage or salary levels and dependency situations. (*See* Table II.) Employers were required to furnish each employee within 30 days after the close of each calendar year a statement of the total amount of taxes withheld.

Although the new law accomplished a considerable degree of current tax collection in 1943, it was estimated by the treasury that only 17,000,000 of the 44,000,000 taxpayers affected would become fully current during the year, with the remaining 27,000,000 not becoming fully current until 1945, when they paid off the 25% portion of their "abatement year" tax liability that had not been "forgiven."

Tax Abatement.—The much-discussed "tax-forgiveness" clause of the so-called Ruml plan was incorporated in modified form in

Table I.—*Family Status Withholding Exemption Schedule*

Pay roll period	Single person	Married person claiming whole of personal exemption for withholding or head of family	Married person claiming half of personal exemption for withholding	Married person claiming none of personal exemption for withholding	Each dependent, other than the first dependent in the case of the head of a family

$200 or over		20% of the excess over $200 plus									
		$40.00	$38.80	$37.60	$36.40	$35.20	$34.00	$32.80	$31.60	$30.40	$29.20

If the number of dependents is in excess of the largest number of dependents shown, the amount of tax to be withheld shall be that applicable in the case of the largest number of dependents shown reduced by $1.20 for each dependent over the largest number shown, except that in no event shall the amount to be withheld be less than 3 per centum of the excess of the median wage in the bracket in which the wages fall (or if the wages paid are $200 or over, of the excess of the wages) over $12, computed, in case such amount is not a multiple of $0.10, to the nearest multiple of $0.10.

*Similar tables are provided in the act for biweekly, semimonthly, monthly and daily pay rolls.

the Current Tax Payment act. To ease the burden of transition to current tax collection, the act provided for at least 75% abatement of 1942 or 1943 tax liability (whichever was smaller) for everybody and 100% tax abatement in the lower brackets. A taxpayer owing less than $50 in taxes for either 1942 or 1943 was relieved of any tax liability. Each taxpayer whose tax bill under the abatement plan was between $50 and $66.67 was freed of paying $50 of the amount, the remainder to be paid in two installments—on March 15, 1944, and March 15, 1945. Abatement of 75% was made applicable to all persons whose tax liability exceeded $66.67, the remaining 25% of the tax to be paid one-half on March 15, 1944, and the other half on March 15, 1945, in addition to current taxes. The withholding levy did not apply to income derived from sources other than wages or salary, such as dividends, interest, etc.

The abatement provisions did not have the effect of reducing taxes due in 1943 or 1944, as many had anticipated. It was pointed out by the treasury department that the taxpayer generally would not benefit immediately unless his income fell off, but that he would have the satisfaction of knowing that at death he would owe no income tax. As a matter of fact, treasury officials estimated the new collection system would add about $3,000,000,000 to tax collections for the fiscal year ending June 30, 1944, due in large measure to current collection of taxes on the higher levels of individual incomes in 1943 and 1944.

Quarterly Estimates of Income.—The law provided for filing of quarterly estimates and partial payments by taxpayers in certain categories, with a final complete return and adjustment on March 15 of each year. As applied to 1943, an estimate of income for the full year and remittance of taxes due was required on or before Sept. 15 from single persons whose wages or salary exceeded $2,700 a year, married persons with pay in excess of $3,500 annually, or those receiving more than $100 income a year from sources other than wages or salary, regardless of the amount of such wages. A penalty of 6% interest was provided for failure to estimate within 80% of the correct tax liability for the year, but leave was granted the taxpayer to revise his estimate on or before Dec. 15 and thus escape the penalty if his revised estimate was not more than 20% below the correct amount to be determined in the complete return to be filed March 15, 1944. Special provision was made for farmers, who were not required to file an estimate in September but did have to file on or before Dec. 15, 1943. The penalty in the case of the farmer applied only if his estimate was less than 66⅔% of his tax liability as determined by the final return March 15, 1944.

State and Local Taxes.—The general trend of revenue legislation on the part of state governments during 1943 was toward a recognition of the unprecedented burden imposed upon the aver-

age taxpayer by heavy wartime federal income taxes and the purchase of war bonds. Various types of relief were instituted. Thirty states enacted laws affecting the payment of state income taxes. Pay for service in the armed forces was exempted from taxation in Arkansas, California, Indiana, New York, North Carolina, North Dakota and Wisconsin. Similar exemption of amounts under $2,000 was made by Minnesota, and under $3,000 by Oregon. South Dakota and West Virginia repealed their income tax laws altogether. Pension annuities and allowances for disability resulting from military service were exempted from gross income tax by Maryland. Collection was deferred in Montana and Vermont in cases where ability to pay was impaired by war service. Eight other states extended for various periods the deadline for filing returns on income other than service pay. Indiana exempted such income from all taxes in event of death while in service.

Postwar planning and financial preparation for the transition to peace times received attention in practically all of the 44 states where legislative sessions were held during 1943. New official boards were set up to deal with the fiscal problems involved. Long-term development projects were authorized and funds provided to carry out the work. Wisconsin, for example, extended the privilege dividend tax and the tax on tobacco products to 1945 to create revenue for postwar rehabilitation of discharged soldiers. Cities in various states were given authority to build up cash reserve funds. New Hampshire levied an additional $3 poll tax to pay bonuses to veterans.

A 1% war emergency gross income tax for 1943 and 1944 was enacted by Delaware, in addition to the net income tax already in effect. A credit of $624 a year was allowed. Temporary increase to 6% in the corporation franchise tax rate in New York was extended until Nov. 1, 1944. The temporary additional taxes on individual incomes in Massachusetts were extended through 1946. Several states followed the example of the federal government in abolishing the requirement for sworn returns. Pennsylvania eliminated credit to corporations for federal income or excess profits taxes. Among deductions provided for by state statutes were: Limited medical and hospital expenses by Iowa, Maryland, New York, North Dakota, Oklahoma and Wisconsin; contributions for charitable or educational purposes, in varying degrees, in Alabama, North Carolina and South Carolina.

The situation resulting from renegotiation of war contracts received attention in several states. Connecticut provided for the filing of amended returns by the taxpayer following notice by the U.S. government of an adjustment affecting profits. Credits and refunds were allowed in Alabama, California, Kentucky, Massachusetts, Virginia, Wisconsin, and to a limited degree in Minnesota and New York. The maximum income tax rate was reduced in California to 6% on income in excess of $25,000 and personal exemptions were raised. Iowa indulged in a little "forgiveness" by providing for a settlement in full for 1942 and 1943 taxes on the basis of 50% of the amount due. Maryland allowed a credit of 33⅓% against taxes due for 1942, 1943 and 1944. Oregon's corporation income tax rate was cut from 8% to 5%, contingent upon enactment of a sales tax. Normal income taxes were reduced and the surtax repealed, also subject to approval by the electorate of an act providing for a 3% tax on gross income of retailers from sales of tangible personal property. South Dakota rendered its income tax ineffective by repealing the rate-fixing section. The personal income tax was repealed by West Virginia.

New taxes or revision upward of rates on alcoholic beverages was the order of legislation in 28 states that made changes in their liquor laws during 1943. Legislation affecting gasoline and petroleum products was confined principally to administrative regulation changes. Life insurance premiums were subjected to a 2% tax in Massachusetts, and Arizona imposed a 5% net income tax on all banks doing business within the state. The bank tax in Rhode Island was increased from 3% to 4%. Various unimportant changes were made in property taxes and motor vehicle taxes by several states. Sales taxes were continued in most states where a time-limit applied. (*See* also BUDGET, NATIONAL.)

Great Britain.—As in the United States, the taxation policy of the British government in 1943 veered further toward the prevention of inflation through soaking up as much of the excess income of the people as possible. The Budget White Paper in April showed that there had been a remarkable increase in income of wage earners between 1939 and 1943. More than 85% of net income (after payment of income taxes) went to weekly wage earners in 1943. Government taxes (central and local) in Great Britain rose from £1,100,000,000 in the 1938–39 fiscal year to an estimated total of more than £3,000,000,000 ($12,000,000,000) in 1943–44. The standard rate of individual income tax in effect in 1943 was 10*s.* in the £—50%. The surtax rate was graduated. Individuals were subject to income tax and surtax. The income tax began on earnings of £110 ($440) a year for the single person, and on income of £156 ($624) a year for a married person; married, with one child, £211; with two children, £267; three children, £322. After certain allowances, such as for incapacitated relatives, housekeepers, and life insurance premiums, the first £600 of "taxable income" was taxed at the rate of 32½% and the remainder at 50%. A system of tax withholding by employers was in effect with respect to weekly wage earners, with special provisions to relieve "hardship" cases. Postwar credits were made applicable to a portion of taxes paid.

The individual surtax was assessed against all income over £2,000. A rate of 10% applied to the first £500 of surtax income, with a gradual rise until all persons with income in excess of £20,000 paid surtaxes at the rate of 47½%. The combined tax rate on all incomes above £20,000 a year was 97½%. Estate taxes ranged from 1% on estates of £100 to 36% on estates of £25,000, 52% on £1,000,000, and 65% on £2,000,000.

The British system of taxing business profits in 1943 was severe. An excess profits tax of 100% was imposed on all profits in excess of those made in specified "standard years," subject to a 20% refund after the war. This refund would be taxable at the rate current at that time. As an alternative, a tax of 5% on incorporated business and 4% on unincorporated business was collected if the yield would be greater. The 50% standard rate of income tax applied to all remaining profits. Dividends were subjected to a double tax in that the recipient was required to include in his income, not the sum he received but the amount that would have been paid to him by the corporation had it not been required to pay the income tax of 50%.

The excise taxes remained heavy and the "purchase" tax, based on the wholesale cost of commodities, rose as high as 100% on luxuries such as jewellery, furs and silk dresses.

As outlined by the financial secretary of the treasury on Sept. 22, 1943, the British government decided to introduce a "pay-as-you-earn" system of income tax collection for the fiscal year beginning April 6, 1944, to apply to all persons paid weekly. As described in a special White Paper, "the tax deducted from earnings *in* any financial year will represent the liability *for* that year, measured by the actual earnings *of* that year, and the deductions of tax week by week will keep pace with the accruing liability." Under the plan accepted, the "code number" of each wage earner was to be sent to his employer who, in addition, would be issued "tax tables" showing for each "code" the "cumulative" tax payable on any given aggregate amount of wages up to the end of each week of the fiscal year. The "cumulative" tax shown in the tax tables for aggregate earnings up to a given week

of the financial year would take account of the tax-free allowances up to that date, as well as the tax-free allowance of one-tenth on earned income (maximum allowance £150) and of the lower rate of tax (6*s*.6*d*. in the £ instead of the standard rate of 10*s*. in the £) on the first £165 of taxable income. On the basis of the code the employer would be able to record the earnings and tax payable by each wage earner.

Canada.—Under the new pay-as-you-earn system put into effect in Canada in 1943, the individual taxpayer was required to pay somewhat larger amounts than in an ordinary year, despite a 50% "forgiveness" of 1942 income tax. Corporation taxes were practically unchanged. Excise taxes, already high, were increased in some instances. The impost on spirits and tobacco was boosted —spirits from $9 to $11 per proof gallon, raw leaf tobacco from 20 cents to 28 cents a pound, manufactured tobacco from 51 cents to 67 cents, cigarettes from $8 to $10 per 1,000, cigars from $4.25 to $9.25 per 1;000.

Direct and indirect taxes were greatly increased as a result of the war. Direct taxes raised eight times as much revenue in the fiscal year ending March 31, 1943, as in the last full peacetime year. During that period the number of persons paying taxes increased from 300,000 to more than 2,000,000 The minimum rate on corporations was 40% of profits and the rate on excess profits was 100%, with 20% refundable after the war.

The pay-as-you-earn method of collection began April 1, 1943. In making adjustments in payments, 50% of the tax liability for 1942 was wiped out. Part of the income tax payments represented a saving portion to be refunded to the taxpayer after the war, with interest at 2%. Luxury taxes were increased. (*See* also BUSINESS REVIEW; LAW; NATIONAL DEBT.) (C. A. SR.)

Tea. The general supply of tea continued to be ample through 1943 and the new crop plus the carryover assured an ample supply for 1943–44. The principal sources, India and Ceylon, had good crops although smaller crops were reported in East Africa. Under agreement, the British food ministry bought these crops and allotments were made by the Combined Food board. The U.S. allotment was about 65,000,000 lb. for 1943, most of it for civilian use, since relatively small amounts were used by the U.S. military forces, except those stationed in Great Britain and Africa. While tea consumption declined in 1941–42 it appeared to be approaching normal in 1943. The shift from tea to coffee by many consumers appeared to be permanent however as the coffee restrictions were lifted. (J. C. Ms.)

Tedder, Sir Arthur William (1890–), British air officer, was graduated from Magdalene college, Cambridge in 1912, and served with the royal flying corps in France during World War I. He attended the Royal Naval Staff college, 1923–24, headed the air armament school at Eastchurch and directed training at the air ministry. In 1936, he became air officer commanding the R.A.F. in the far east and in 1940, he was promoted to deputy commander in chief of the R.A.F. in the middle east. As commander in chief in 1941, he was credited with having smoothed over the friction between air, land and naval forces on the desert front. In 1942, Tedder made great progress in co-ordinating air with ground forces, first in the campaign in April against Marshal Erwin Rommel, which ended in defeat, and later in the great British offensive which started in Oct. 1942, and ended in victory. He was knighted "for distinguished services" and became vice-chief of the air staff. On Feb. 11, 1943, he was named air chief in the Mediterranean theatre, and on the following Dec. 28 he was named deputy supreme commander of the invasion forces under Gen. Dwight Eisenhower.

Tehran, Declaration of: *see* UNITED STATES.

Telegraphy. During the year 1943 the task of handling the large volume of telegrams and cablegrams required for the conduct of the war continued to be the first consideration of the telegraph industry. The telegram and the cablegram were used primarily for war purposes. The war, of course, put a heavy burden on the U.S. telegraph system. In the output of every instrument for war, the telegraph played a part. The telegraph company handled more than 200,000,000 telegrams and 10,000,000 telegraph money orders in 1943, despite the fact that some 7,000 of its employees entered the military services and there was a lack of essential materials for expanding its equipment.

By the end of 1943, the company had provided telegraph facilities for more than 4,000 projects for the army, the navy, the civil aeronautics administration and other government agencies and war plants. Many of these involved the construction of lines to isolated spots where new war plants, camps and bases were located.

The telegraph company's laboratories also were devoted largely to the development of special equipment for war purposes, but most of this equipment is secret.

The most important development of the year in the communications field was the merger of the Western Union Telegraph company and Postal Telegraph, Inc., which became effective at midnight, Oct. 7, 1943. The merger fulfilled the principle upon which Western Union was founded: namely, that a proper telegraph service calls for a system reaching all important points, under a single management, with a fixed tariff and uniform standards of efficiency. Until 1943, the law had prohibited telegraph mergers, but permissive legislation was enacted by Congress in March following hearings in which a telegraph merger was advocated by the Federal Communications commission and all public agencies concerned, including the army and navy.

Following the consummation of the merger, co-ordination of management and administrative personnel of the two companies was promptly effected. All Postal main and branch offices were made Western Union branches. During the integration period, which was expected to require about two years, it was planned to maintain the trunk lines as well as most of the main offices of both companies. The Postal employees were transferred to the Western Union service rolls.

Western Union's plan for expanding and modernizing its plant was retarded by the war, but there were certain scheduled improvements, costing about $4,000,000, which were important to the war and which were being carried out.

A number of technical improvements were placed in wider use in 1943 and further increased the capacity of the telegraph trunk lines. These improvements included the extended use of direct circuits, carrier systems, the Varioplex, reperforator switching, improved repeaters, sub-center switching and facsimile telegraphy. All these facilitated the handling of the swollen volume of wartime traffic. In particular, the extended use of leased wire switching systems was found to be an essential war requirement.

Statistics.—Reliable statistics covering the telegraph systems of the world in 1943 were not available but the latest comprehensive data for the land line wire telegraph systems of the United States (aside from that of telephone companies) follows:

Mi. of pole line	240,998
Mi. of underground conduit (single duct)	6,161
Mi. of aerial wire	1,823,323
Mi. of aerial cable wire	122,617
Mi. of underground cable wire	335,846
Mi. of land line submarine cable wire	9,562
Total mi. of land line wire (approximately 77% copper)	2,288,348

Number of telegraph offices	22,586
Approximate number of telegraph agencies	15,500
Approximate number of revenue messages transmitted	214,000,000
Approximate investment in operated land lines plant	$375,642,000

The submarine cable telegraph systems of the world, so far as indicated by the latest available data, consist of about 360,000 mi. of ocean cable, containing about 432,000 mi. of copper conductors and representing a capital outlay of about $400,000,000. Approximately 80% of the total mileage of ocean cables was provided by private enterprise and the remainder by government administrations. (A. N. Ws.)

Telephone. During the year, the number of telephones in the United States increased from about 24,900,000 to about 26,400,000. Telephone plant investment showed an increase of about $100,000,000. These gains, and other increases in the physical facilities employed in providing telephone service which might be cited, assume full significance only in the light of the fact that they were made at a time when many of the materials required in telephone manufacturing and construction were being diverted in large quantities to uses more directly involved in the war effort. Increases in these physical facilities were made by the telephone companies only on the basis of their necessity as contributions toward victory—toward the efficient handling of a rising tide of war telephone calls.

During 1943, toll and long distance telephone traffic continued to increase, from about 3,600,000 a day to around 4,100,000 a day, on an average. The total for the year of long distance messages involving the lines of the American Telephone and Telegraph company was about 150,000,000 as against about 59,000,000 in 1939, a typical prewar year, and about 114,000,000 in 1942.

Handling this increasing wartime traffic, without being able to provide additional facilities in sufficient amounts, continued to be a major problem of the business. Typical of many steps taken during the year toward its solution was the more extensive use of carrier currents.

A new method, employing the crossbar principle, by which toll operators can dial calls, in much the same manner as numbers are dialled by subscribers, was introduced in a large area centring around Philadelphia.

Continued emphasis was placed by the telephone companies on the conservation of critical metals and other materials. Important savings were effected, for example, through the introduction of a device by which weathered drop wires can be repainted and protected from further deterioration, without removing them from the plant.

Contrasted with this simple tool is an extremely complex product of telephone research, experimentation and engineering, first demonstrated to the public late in the year. This is an electrical gun director which computes automatically the intricate mathematical problems involved in accurately directing anti-aircraft fire. Making allowances for such factors as temperature, barometric pressure, wind velocity and direction, latitude and height and speed of the plane, it tracks its target and aims a number of guns simultaneously.

These two devices, occupying opposite extremes of simplicity and complexity, were typical of many other developments by telephone organizations during 1943 which proved valuable contributions to the winning of the war.

The provision of telephone facilities for army camps, naval bases and other military establishments, as well as for war plants, was a problem of increasing scope and difficulty. In many cases, factories producing war materials were provided with special telephone equipment or routines which materially increased their speed of production.

During the year, the total number of service men instructed in plant schools maintained by the telephone operating companies grew to more than 8,000. Of nearly 55,000 Bell system employees in the armed forces at the end of the year, about 15,000 were in the signal corps, and many others in corresponding branches of the navy, the marine corps or the coast guard. Large numbers of employees of the independent telephone companies were also serving in the armed forces.

Appeals to the public, through an extensive advertising and publicity campaign, to avoid making unnecessary long distance calls to busy war centres, to limit the length of their conversations when circuits were busy and to refrain from making calls that might interfere with "service for service men" met with cordial co-operation. (W. S. G.)

Television. During 1943 television activities in the United States and abroad were wholly directed toward advancing the progress of the war. Although television broadcasting to home-installed televisors was maintained on a token basis, the programs were principally directed to meeting military requirements. Instruction of air-raid wardens, first aid workers and other civilian war workers was continued, in view of the fact that television provided effective means for bringing a single lecture before thousands rather than tens of interested observers. No additional television receivers were manufactured and sold during the year, because of war need for the materials that would have been involved, but supplemental service was provided by the donation of personally owned and home-installed sets to hospitals and other group centres, so that television transmission of sport events and telecasts of comparable entertainment programs were made available to audiences, including returned service men, much more widely than would otherwise have been possible.

Although the application of television's scientific principles revolved almost entirely around wartime uses, it was generally recognized that the future would see television broadcasting on a basis technically superior to anything available prior to Pearl Harbor. Among the anticipated improvements were increased service distances, based partly upon better synchronizing systems capable of operating in the face of more severe interference conditions, together with the availability of larger pictures projected upon flat screens of either home or theatre size. The expected advent of such satisfactory television service gave rise to speculation and, indeed, to planning as to the character of television programs that might be expected to fill the postwar requirements of a national audience. One result of activity along these lines was an experiment at Schenectady, N.Y., where a complete edition of a daily newspaper was presented to a television audience. First the pages of the newspaper were shown on the screen, and then each feature was "acted out" for the benefit of the observers. Seeing news commentators, cartoonists and advertising models come to life visually, and hearing their aural presentations simultaneously with their appearance, was judged as suggesting an additional program possibility that would probably be of widespread interest. Analysts of the future of home television seemed to feel that there would be available many types of useful and interesting programs, and that their production would not involve the high costs, probably prohibitive for television, that were usually associated with the making of feature films by the motion picture industry.

Thus, although the scientific aspects of television were so closely tied into direct wartime applications that they may not even be outlined, during 1943 there was moderately extensive study and discussion of how television might best be developed as a postwar public service. The need for co-ordinating current scientific developments into a sound industrial plan for the whole

of radio, including television and facsimile, resulted in the organization of the Radio Technical Planning board. This large group, drawn from the entire radio field, was not only set up to plan the future of television as did the National Television Systems committee in 1940 and 1941, but to analyze in similar manner the other branches of radio. Colour television, the transmission of larger and more detailed pictures, co-ordination with recording methods and the use of television principles for determining range and direction were among the topics to be studied. Just as the industry-wide agreement as to television practices, reached through the work of the National Television Systems committee, resulted in the initiation of commercial television on July 1, 1941, the conclusions of the Radio Technical Planning board were expected to provide a sound basis for new and expanded industrial activities in radio and television as production facilities are gradually released from direct war manufacturing. (J. V. L. H.)

Great Britain.—In the colour television systems successfully demonstrated in Britain (Baird) and America (Goldmark) the projection of successive colour frames was accomplished by the use of a rotating filter disk interposed between the screen and the observer. The presence of this filter disk introduced certain disadvantages, particularly as the merit of the cathode-ray tube as a television reproducer lies in the absence of mechanical moving parts.

Accordingly John L. Baird was experimenting with a colour television system in which successive images are projected through separate lenses and combined on the viewing screen. Each lens is fitted with an appropriate colour filter, and the images are reproduced one above the other on the screen of a projection tube. These images are then converged by the individual filters and lenses on to the screen.

Proper registration of the pictures on the viewing screen presents the major difficulty of this system, which by 1943 had only been demonstrated in two colours. The size of picture shown was 6 in. by 5 in. with 600-line definition.

Although general research on television was still restricted, the form in which an improved service would be resumed after the war was the subject of much discussion. Although it was generally agreed that the British standard in operation at the outbreak of war (425 lines, 50 fields, interlaced) did not approach perfection, the view was expressed that it would be economically desirable to re-establish it as early as possible and aim at making the fullest use of the available definition within the existing band of frequencies.

Tellurium.

There was an enormous expansion in the production and use of tellurium in the United States in 1941, with output increasing 170% to 239,983 lb., but the 1942 output dropped back to 98,798 lb., only 11% ahead of 1940. (G. A. Ro.)

Tennessee.

A south central state, 16th to enter the union, called the "Volunteer State." Land area 41,961 sq.mi., water area 285 sq.mi. Population (1940) 2,915,841; rural, 1,888,635; urban, 1,027,206; rural farm, 1,271,944; native white, 2,395,586; Negro, 508,736; foreign-born, 11,320; other races, 199. Capital Nashville (167,402). Other cities include Memphis (292,942); Chattanooga (128,163); Knoxville (111,580).

History.—Governor of Tennessee in 1943 was Prentice Cooper; secretary of state, Joe C. Carr; state treasurer, John W. Harton; comptroller of the treasury, Robert W. Lowe; adjutant general, Thomas A. Frazier; attorney general, Roy H. Beeler. Commissioners were as follows: agriculture, C. C. Flanery; conservation, Paul S. Mathes; education, B. O. Duggan; finance and taxation, George McCanless; highways and public works, C. W. Phillips; institutions, W. O. Baird; welfare, William A. Shoaf; insurance and banking, J. M. McCormack; labour, S. E. Bryant; public health, Dr. R. H. Hutcheson; railroad and public utilities, Porter Dunlap, Leon Jourolman and John C. Hammer.

Education.—In 1942, of 5,373 elementary schools, 1,495 had three or more teachers; the number of one-teacher schools declined from 3,555 in 1927 to 2,425 in 1942. Enrolment in elementary schools in 1942 was 511,312. In 1942 there were 581 high schools with a total enrolment of 124,514; the number of teachers, 5,428.

Public Welfare, Charities, Correction.—In June 1943, 69 WPA recipients received $15,362; 39,050 old-age recipients, $556,167; aid to dependent children, 32,510 (12,832 families), amount $264,999; aid to blind, 1,593, amount $20,650. In 1942–43 there were eight correctional institutions with approximately 4,057 inmates; expenditures, $1,443,506. Separate schools were maintained for the blind, the deaf, and the underprivileged; three state hospitals for the insane; a home and training school for feeble minded.

Communication.—In 1942, of about 82,000 mi. of public road, 7,510 mi. comprised state highways; state expenditures were $14,192,978 for the 1942 fiscal year. There were 3,503 mi. of railroad in 1942. In Nov. 1943 there were 30 airports, of which 18 were civil fields, 8 CAA intermediate fields and 4 army fields; there were 720 mi. of designated airways. Of the 333,600 telephones in the state, 232,500 were residential and 101,100 business. Water-borne commerce on the Tennessee river in 1940 amounted to 2,206,913 short tons; Cumberland river, 852,138; Mississippi river, 7,055,675 short tons from Ohio river to Baton Rouge and 1,841,068 at Memphis.

Banking and Finance.—In June 1943, there were 69 national banks with 17 branches and 226 (June 30, 1943) state banks with 31 branches; assets, $904,009,000 for national and $349,860,195 for state banks; deposits, $850,476,000 for national and $322,645,959 for state banks. Savings and loan associations in Dec. 1942 numbered 42, with assets of $38,881,300.

Total state revenue for the fiscal year 1942–43 was $53,105,680; revenue shared with counties and cities, $7,759,289; revenue for state purposes, $45,346,391. Direct bonded debt for the state on June 30, 1943, was $94,923,000; highway reimbursement debt, $12,002,156; gross debt, $106,925,156; unencumbered surplus in sinking fund, $21,930,969; net debt, $84,994,187.

Agriculture.—There were 247,617 farms in 1940 with a total of 18,492,898 ac.; 6,158,662 ac. of cropland were harvested. Gross value of agricultural production in 1942 was $327,614,000; cash farm income, $254,761,000 (including government payments); cash farm income from crops was $127,147,000; from livestock and livestock products, $114,189,000; government payments to farmers, $13,425,000. Gross farm income from crops was $127,147,000 in 1942. The forest area is approximately 14,000,000 ac.

Table I.—*Leading Agricultural Products of Tennessee, 1943 and 1942*

Crop	1943*	1942
Corn, bu.	61,662,000	75,924,000
Tame hay, tons	2,076,000	2,339,000
Cotton, bales	510,000	625,000
Wheat, bu.	4,116,000	5,234,000
Tobacco, lb.	96,408,000	87,808,000
Potatoes, bu.	4,736,000	3,564,000
Sweet potatoes, bu.	4,590,000	3,600,000

*Estimated.

Manufacturing.—In 1939 (the latest data available in 1943) 2,289 manufacturing plants yielded products valued at $728,087,825, of which $320,341,902 was added by manufacture. The

number of wage earners increased from 107,645 in 1925 to 131,874 in 1939; wages paid in 1939, $109,661,769.

Table II.—*Principal Industries of Tennessee, 1939 and 1937*

Industry	Value of products	
	1939	1937
Rayon and allied products	$40,724,728	$49,132,660
Hosiery	33,798,963	29,219,241
Meat packing, wholesale	28,266,104	29,491,149
Chemicals	25,639,499	38,048,635
Cooking and other edible fats	19,787,646	36,457,022
Footwear (except rubber)	17,740,737	20,807,976
Flour and other grain mill products	16,147,788	22,673,578
Cottonseed oil, cake, meal linters	15,390,972	20,150,709

Mineral Production.—The total value of minerals produced in Tennessee in 1941 was $56,301,592, compared with $42,683,407 in 1940.

Table III.—*Principal Mineral Products of Tennessee, 1941 and 1940*

Mineral	Value 1941	Value 1940
Aluminum	*	$30,023,000
Coal	$16,454,539	12,024,742
Stone	9,157,673	6,674,710
Cement	8,520,284	5,655,635
Zinc	5,425,500	4,384,296
Sand and gravel	2,829,836	2,255,287
Lime	1,354,642	1,050,199
Coke	1,118,725	618,746
Clay products (other than pottery and refractories)	2,401,000	1,869,000

*Not included in total value of minerals in 1941.

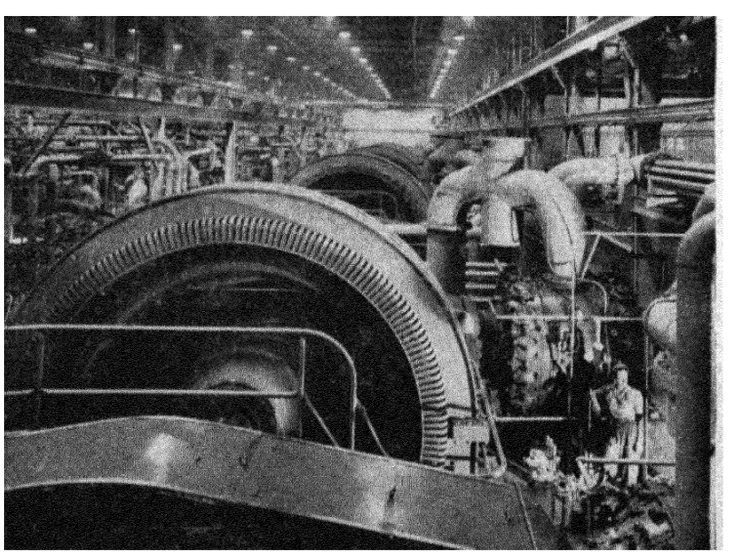
(C. E. A.)

Tennessee Valley Authority.

The TVA in 1943 continued its contributions to prosecution of the war in every field of its widespread activities. These included production of electric power, construction of new dams to provide new supplies of power, manufacture of munitions, research and education in wartime food processing and preservation, production and testing of phosphatic and nitrogenous fertilizers to increase farm output, assistance to industry and agencies of government by providing information and technical assistance, and construction of facilities to improve the wartime usefulness of the navigation channel.

Four new dams were placed in operation during the year, bringing the total constructed by TVA to 14 and the total in operation to 20. Douglas dam was placed in operation after a record-breaking construction period of 12 months and 19 days, and others completed were Fort Loudoun, Apalachia, and Ocoee No. 3. Filling of Fort Loudoun dam reservoir in Sept. 1943 extended the navigation channel in the Tennessee to its full commercial length of 650 mi., although accomplishment of the all-year full project depth to accommodate boats and barges of 9-ft. draft awaited closure of Kentucky dam in 1944 and completion of a small amount of dredging. Governing depths in low water periods pending completion of these jobs was 6 to 8 ft.

In 1943 the TVA constructed and operated four public use river terminals at Knoxville and Chattanooga, Tenn., and Decatur and Guntersville, Ala., and a coal terminal at Harriman, Tenn., in order to increase the wartime usefulness of the Tennessee channel which connects at Paducah, Ky., with the 8,000-mi. inland waterway system stretching from New Orleans and the Gulf coast to Minneapolis and St. Paul, Minn.; Pittsburgh, Pa.; Chicago, Ill.; and Kansas City, Mo. Traffic on the Tennessee increased from 138,400,000 ton-miles in 1941 to 161,500,000 ton-miles in 1942, as compared with 32,700,000 ton-miles in 1933, and cargoes included large amounts of petroleum products, grain from the midwest, coal, pig iron and military vehicles. The TVA multipurpose system of dams provided 8,000,000 ac.-ft. of storage for flood control at the close of 1943; the total will be increased to almost 14,000,000 ac.-ft. with completion of Kentucky and Fontana dams in 1944 and 1945. Kentucky dam, which will have more than 4,500,000 ac.-ft. of useful storage for flood control on the lower Ohio and Mississippi rivers, was under construction near the mouth of the Tennessee. Fontana dam, being built on the Little Tennessee in North Carolina in 1943, was planned to be the highest dam in the eastern United States, rising 460 ft. from bedrock.



The power system, consisting at the close of 1943 of the 14 multi-purpose dams built by the TVA, Wilson dam transferred from the war department in 1933, and five acquired dams, plus five supporting steam plants, one of which was built by TVA, was producing power at the rate of more than 9,000,000,000 kw.-hr. a year. About three-quarters of the total output was being used by war industry, served either directly from the TVA transmission system or through 83 municipal and 45 co-operative distribution systems. Aluminum, copper, plastics, shells, army clothing, aeroplanes and heavy chemicals were some of the products being manufactured by TVA power. Dams placed in operation plus additional installations at existing projects brought the total installed capacity of the system to more than 1,800,000 kw. by the close of 1943 as compared with 1,375,000 kw. on June 30, 1942, and 1,639,000 kw. on June 30, 1943. Construction going forward under War Production board allocations was expected to bring the installed capacity to about 2,100,000 kw. in 1945.

Total power operating revenues for the fiscal year 1943 exceeded $31,500,000, and net income amounted to nearly $13,150,000. Net income plus interest paid on bonds represented a return on average power investment of about 5%.

In its plants at Muscle Shoals, the TVA produced ammonium nitrate and elemental phosphorus for munitions, calcium carbide for synthetic rubber, and concentrated phosphatic fertilizers to strengthen wartime food programs both in the United States and abroad, where large quantities were shipped under lend-lease. Ammonium nitrate, not needed for munitions, was released for use as fertilizer. A sample study in one state showed that test-demonstration farms using TVA phosphates had increased production by 30% without additional manpower or machinery. On June 30, 1943, 44,389 test-demonstration farmers in 28 states were using TVA phosphate fertilizers.

In co-operative research, the TVA and the University of Tennessee developed equipment and techniques for both community and home dehydration of fruits and vegetables and carried on educational campaigns to further their construction and proper use. The War Production board authorized use of materials to construct 40,000 units of a home dehydrator developed by the

INTERIOR OF THE AMMONIA PLANT at Nitrate Plant No. 2, Muscle Shoals, Alabama, where ammonia was produced for explosives in 1943. Women workers were trained to do many of the jobs formerly held by men

TVA and the university, but production was limited. TVA provided technical advice to many food processors. Information was provided to both government and industry on availability of raw materials, plant sites, transportation and processing methods. The TVA was mapping strategic areas for the U.S. army and designing 13 dams for the Russian government under lend-lease.

A peacetime forest inventory yielded valuable information on location and availability of woods for ships' timbers, aeroplane veneer, tanning extracts and many other uses, and landowners were assisted in making their timber available for war uses in a manner to maintain the long-term usefulness of their forests.

As of June 30, 1943, TVA power was being distributed to more than 500,000 residential, farm, commercial and industrial consumers through the municipal and co-operative distribution systems. Cost of residential service under TVA rates fell to an average of 1.96 cents per kw.-hr., as compared with the United States average of 3.67 cents per kw.-hr. Average use per residential consumer for the fiscal year was nearly 1,600 kw.-hr., or over 50% higher than the national average.

The TVA made no request for additional appropriations for the fiscal year which commenced July 1, 1943, but is carrying on its operations with revenues and previously appropriated funds. The total funds made available to TVA from 1933 through the fiscal year 1943 were $733,041,770, consisting of $667,969,270 in congressional appropriations and $65,072,500 from sale of bonds.

Members of the TVA board of directors in 1943 were David E. Lilienthal, chairman, Harcourt A. Morgan, and James P. Pope. (*See* also DAMS; ELECTRICAL INDUSTRIES; PUBLIC UTILITIES.)

(W. L. S.)

Tennis. As in 1942, many tennis tournaments in the United States were cancelled either for lack of competitors or insufficient galleries or both. Some, however, were held much as usual, including several events on grass in the east. The national championships were played at the West Side Tennis club, Forest Hills, Long Island, in the first week of September. Entries were limited to 32 players in the men's and women's singles. John A. Kramer, former national doubles champion, defeated the only foreign threat in the semi-finals by beating Francisco Segura of Ecuador in five sets but lost in the finals to Lt. Joseph R. Hunt, USN, in five sets. Miss Pauline Betz repeated her 1942 triumph by winning the women's singles title over the same adversary, Miss Louise Brough. The men's doubles was won by Kramer and Frank A. Parker, and the women's by Miss Brough and Miss Margaret Osborne. (J. R. TU.)

Termites: *see* ENTOMOLOGY.

Tesla, Nikola (1856–1943), U.S. electrical inventor, was born July 10 at Smiljan, Croatia (Yugoslavia). Of his claimed 700 inventions, his most important were developed before the turn of the century and included the induction motor, transformer and the principle of the rotary magnetic field. Handicapped by lack of funds and a poor business sense, he was compelled, for years, to conduct his experiments in hotel rooms. In an interview on his 78th birthday, he said that he had invented a "death beam" capable of destroying 10,000 aeroplanes at 250 miles' distance and of killing an army of 1,000,000 instantly. In ill health, he lived the last years of his life almost as a recluse and was found dead in his hotel room in New York city, Jan. 7. (See *Encyclopædia Britannica.*)

Texas. A south-central state of the United States, admitted to the union in Dec. 1845; popularly known as the "Lone Star state." Area, 263,644 sq.mi. (plus 3,095 sq.mi. of inland water surface); pop. (1940), 6,414,824. Rural population was 3,503,435 or 54.6% of the total. Negroes and other non-whites constituted 14.5% of the population. Since 1940, census bureau estimates indicate that growth of urban population ranges from 6.4% at Amarillo to 30.7% at San Antonio. Capital, Austin (87,930 in 1940). Three largest cities in 1943, as estimated by census bureau, based on registrations for war ration books were Houston, 588,175 (384,514 in 1940); Dallas, 440,888 (294,734 in 1940); San Antonio, 412,905 (253,854 in 1940).

History.—No general election was held in Texas during 1943, and there was little political activity or interest. The war disrupted normal life and, moving the people from one place and from one occupation to another, commanded most of their interest and energy. Cities and towns with army camps or defense plants continued to bulge with newcomers.

While the people remained apathetic, a strenuous campaign against the national administration and its major policies was carried on by the junior U.S. senator, W. Lee O'Daniel, the governor of the state, Coke R. Stevenson, and the lieutenant governor, John Lee Smith. The only state official of any importance who defended the administration was the attorney general, Gerald Mann. He resigned in December and was succeeded by his assistant, Grover Sellers. Other state officers were Jesse James, treasurer; James P. Alexander, chief justice of the supreme court; Bascom Giles, commissioner of general land office; J. A. McDonald, commissioner of agriculture; L. A. Woods, superintendent of public instruction; George H. Sheppard, comptroller.

Education.—For 1942–43 elementary schools had an enrolment of 796,336 white pupils and 174,171 Negroes. Secondary schools had an enrolment of 279,751 whites and 33,893 Negroes; total, 1,284,151. The total teaching staff was 47,334, of which 40,649 were whites and 6,685 were Negroes.

Public Welfare, Charities, Correction.—During 1943 the average number of old-age assistance recipients was 182,765. Case loads ranged from a peak of 183,367 cases to 180,511 cases. Payments to old-age assistance recipients amounted to $44,337,874,82. Average number of cases receiving aid to the blind was 4,427 in 1943, ranging from 4,106 to 4,681 cases with payments to recipients totalling $1,276,596 for the year.

An average of 11,604 families received aid to dependent children during 1943. The case load ranged from 12,168 families to 10,389 families. Payments to recipients totalled $2,967,554.

Eleemosynary institutions in the state numbered 22, of which 13 were hospitals for mental and nervous cases. During 1943 hospitalization for the insane was greatly facilitated by the completion of a 120-bed ward at Terrell State hospital and by renovation of the Confederate Veteran home at Austin to accommodate 375 mentally ill. The 47th state legislature appropriated $3,000,000 for building additional institutions for the insane, but wartime priorities prevented use of most of that sum.

The remaining eleemosynary institutions consisted of sanatoriums for tuberculars, schools for the blind and for the deaf (both white and Negro); two homes for delinquent children; two for white orphans and one for Negro orphans; one for crippled children.

Communications.—The state in 1943 had 26,883.37 mi. of highways, including 24,565.17 mi. maintained by the state, 607.20 mi. in urban areas, and 1,711 mi. not wholly maintained by the state. The amount spent by the state for regular maintenance was $4,892,983.11; for maintenance betterment, $750,233.36; and for traffic service, $1,778,356.10, making an over-all total of $7,421,572.57. Cash disbursed for highway construction, in the fiscal year Sept. 1, 1942–Aug. 31, 1943 was $18,707,473 84. There were more than 22,000 mi. of railway track in 1943.

Banking and Finance.—On Dec. 31, 1943 there were 391 state banks in Texas with total deposits of $536,326,600.69, and total resources of $595,009,572.89. On Dec. 31, 1943 there were 439 national banks in Texas. On Oct. 18, 1943 there were 438 national banks with total deposits of $3,113,803,000 and total resources of $3,296,422,000.

As of Aug. 31, 1943 the total cash balance in state funds (Aug. 31, 1942), plus deposit from revolving fund previously invested in Confederate pension warrants, plus total gross cash receipts for fiscal year 1943 totalled $354,821,921.88. Total gross cash disbursements, end of fiscal year 1943, totalled $290,371,429.09. Cash balance on hand, Aug. 31, 1943 amounted to $64,450,492.79. On Dec. 31, 1943 the state's gross bonded debt was $4,117,200, its cash sinking fund reserve, $15,000, its net bonded debt, $4,102,200. On the same date, its total warrants outstanding and unpaid in general revenue fund amounted to $25,574,326.21; its cash on hand for paying general revenue fund warrants was $7,126,454.42. Net warrant debt was $18,447,871.79.

Agriculture.—Total harvested acreage in Texas in 1943 was 28,921,000 as compared with 26,414,000 in 1942. The ten year average from 1932–41 was 27,417,000. Total cash income, 1943, was $1,087,217,000, almost $2,000,000 greater than in 1942.

Table I.—Leading Agricultural Products of Texas, 1943 and 1942

Crop	1943 (est.)	1942
Wheat, bu	35,697,000	47,438,000
Barley, bu	3,682,000	1,818,000
Oats, bu	15,694,000	11,210,000
Peanuts, lb	423,200,000	430,080,000
Grain sorghums, all, bu	59,475,000	59,675,000
Rice, bu	20,196,000	15,498,000
Hay, all, tons	1,419,000	1,661,000
Cotton (ginnings), 500 lb. bales	3,850,000	3,038,000
Peaches, bu	900,000	1,610,000
Pecans, lb	23,250,000	10,300,000
Grapes, tons	2,200,000	2,200,000

Table II.—Cash Income, Leading Livestock and Livestock Products of Texas, 1943 and 1942

Product	1943	1942
Cattle	$180,784,000	$160,191,000
Milk products	99,271,000	76,715,000
Hogs	48,107,000	28,317,000
Calves	41,058,000	38,192,000
Wool	33,824,000	33,640,000

Manufacturing.—In 1943 value added by manufacturing exclusive of wages paid workers was, approximately, $500,000,000, as compared with $451,000,000 for 1942. Non-agricultural payrolls for 1943 were estimated at $2,800,000,000 as compared with $1,956,000,000 in 1942.

Mineral Production.—Texas led all other states in completion of wildcat oil wells in 1943. Average daily production of petroleum, the state's greatest source of mineral wealth, averaged over 1,000,000 barrels per day. Value of minerals in Texas in 1941 (latest available figures) was about $836,260,000. Since then, the development of the state's mineral resources for war production has greatly increased the value of its minerals. (C. W. RA.)

Texas, University of.

An institution of higher education at Austin, Tex. The 61st annual session opened Sept. 1, 1943, under a new trimester calendar to meet navy requirements. More than 1,100 navy V-12 trainees were assigned to the university for college training July 1, bringing the naval contingent on the campus to more than 2,000, including a naval flight preparatory school stationed here in Jan. 1943, and a CAA-War Training service unit for naval aviation cadets, opened in 1940. The university school of dentistry at Houston was opened Sept. 1, 1943, as the Texas Dental college came under university operation, with Dean F. C. Elliott continuing as its executive officer. The school of dentistry graduated its first class of 31 students Dec. 13, all save five going directly into either army or navy service as commissioned officers. In October the college of nursing at Galveston inaugurated a U.S. cadet nurse corps program, to train student nurses for urgent military and civilian duty. Under its engineering, science and management war training program, the university trained more than 12,000 men and women for war industry in special short courses between Feb. 1941, and July 1943. Activities in the Latin-American field were intensified with the creation of a University Executive Committee on Inter-American Relations in Texas, headed by Dr. G. I. Sanchez as director; operation of a special six-weeks' co-operative field school in Mexico City by the University of Texas Institute of Latin-American Studies and the National University of Mexico; and establishment of a Latin-American workshop for teaching English as a second language. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (H. P. R.)

Textile Industry.

Although the U.S. textile industry did not set a new record for mill activity in 1943, and in fact was slightly under 1942 in that respect, it was still a remarkably active year—the fifth in a series of five successive years of high production.

There was of course some reduction in government purchases of textiles towards the end of the year and there was expected to be even sharper reductions in 1944, but the prospect was that this would be offset by demands for lend-lease and rehabilitation.

One of the most important developments growing out of World War II was postwar implication of research on military textiles. Much of the work that was done would result in better fabrics for civilians. Efforts to make cloths proof against the many demands imposed by use in the arctic and in the jungle, and in the air and under the sea, was expected to result in the postwar production of fabrics which would be more effective in keeping the body warm, comfortable and dry.

One problem which faced the textile industry, and the consuming public, throughout 1943 was the ever-present threat of clothes rationing. That possibility was not completely removed but practically every responsible official connected with any phase of the war effort involving textiles appeared to be sincerely anxious to avoid rationing of clothes. (*See* also COTTON; RAYON AND OTHER SYNTHETIC FIBRES; WOOL.) (D. G. Wo.)

Thailand (Siam).

A kingdom of southern Asia between Burma and French Indo-China, extending southwards into the Malay peninsula; area 198,247 sq.mi.; pop. (census 1937) 14,464,489 (est. March 1940) 15,717,000. Chief towns: (pop. 1937) Bangkok (former cap. 681,214); Chiengmai (544,001); Khonkaen (473,475); Chiengrai (443,476). Ruler (1942): King Ananda Mahidol; language: Siamese; religion: Buddhism.

History.—Thailand's status as Japan's satellite was reaffirmed by announcements early in 1943 that her troops were actively co-operating with the Japanese army on the Yunnan front, and in April the prime minister announced that Thai casualties had totalled 1,172 since the beginning of the war. This military collaboration received its reward during the visit of the Japanese premier to Bangkok in July, with Japan's recognition of "the long-cherished aspirations of Siam for new territory" and her agreement to Thailand's annexation of two Shan provinces, Kengtung and Mong-pan, just inside Burma's S.E. frontier, and of the four Malay states of Perlis, Kedah, Kelantan and Trengganu, an area of about 14,770 sq.mi., rich in tin, rubber and rice resources.

Dissatisfaction and hatred of Japan were reported to be growing in Thailand, however, and in April two well-known Liberal

cabinet ministers, Major Kuang Aphai and Nai Tavi, resigned. Unrest was fomented by a severe rice shortage at the end of 1942, caused by disastrous floods in the Menam river valley, and the price of rice rose to about three times the normal level. Shortage of almost all goods made rationing essential, and a first experiment was made with matches.

"Co-prosperity" meant for Thailand increasing Japanese economic and political control. Early in 1943 it was announced that the Japanese southern affairs bureau was considering the disposition of enemy assets in Thailand and the mobilization of her raw materials, that 150 Thai students were to visit Japan, that a Japanese official would head a cultural institute in Bangkok, and so forth. Labour shortage remained acute, the price of gold rose, there was fear of inflation, and in March 1943 there were tirades from Bangkok radio against the "Jews of Siam" (probably Chinese), who were accused of profiteering and spreading rumours that the tical was to be devalued. A sweeping change came early in 1943 under Japanese inspiration with the banning of the national habit of betel-chewing. (C. M. CL.)

Education.—In 1938–39: government schools 429; scholars 61,297; local public and municipal schools 11,072; scholars 1,484,483; universities 2; students (1937) 11,525.

Banking and Finance.—(1942) revenue, 210,000,000 baht; expenditure 259,000,000 baht, expenditure, capital (est. 1941) 56,056,000 baht; public debt (March 31, 1940) 69,000,000 baht; notes in circulation (July 31, 1941) 226,000,000 baht; reserves (July 31, 1941): gold 97,000,000 baht; foreign assets (July 31, 1941) 152,000,000 baht; exchange rate (average 1940): 1 baht = 35.15 cents U.S.; (Sept. 1941) 1 baht = 36.97 cents U.S.

Trade and Communication.—Foreign trade 1940–41 (merchandise): imports 163,400,000 baht; exports 257,600,000 baht. Communication: roads, state highways completed (1938) 1,815 mi.; railways, open to traffic (1938), 1,925 mi.; airways, length of route opened (1938) 444 mi.; motor vehicles licensed (1937–38): total 11,439 (cars 5,910; trucks 4,233; buses 146; cycles 559); wireless receiving set licences (1938) 29,834.

Agriculture and Mineral Production.—Production (in metric tons): rice (1939–40) 5,082,700; rubber (1940 exports) 45,000; tin ore, metal content (export 1940) 17,700; tobacco (1938–39) 8,400; cotton ginned (1940–41) 2,400; maize (1938–39) 5,600.

Theatre.

The shortage in playhouses, in the U.S. in 1943, because of the theatre's unparalleled prosperity, became so acute both in New York and on the road that various theatres which had long been in disuse or had been given over to other enterprises were hastily reclaimed. Bookings during the second half of the year were at such a premium that desperate producers in several cases went to the extreme of housing their attractions out of town in buildings that previously had been devoted to lectures, concerts and the like. The box-office in the metropolis and outlying cities did such a land-office business even during the summer that surprised managers viewed the situation as a not entirely unmixed blessing, fearing that the war's end might suddenly bring with it a partial collapse of the boom and find them oversold on many an investment.

The boom was brought about by three things. First, the greatly increased earnings of workers in the war industries created a public that hitherto had not been able to afford the luxury of the theatre and that had been forced for its amusement subsistence to patronize the far less expensive motion pictures. Second, the curtailment of travel, both in the matter of trains and automobiles, not only kept many people at home and with the theatre as a substitute diversion but added to the amount of savings they had free for the purpose. And, third, it became more and more evident that a sizeable proportion of men and women who once were satisfied with the films have been educated away from them or perhaps have simply become tired of their endless repetitions and have increasingly sought the theatre for relief. The general quality of drama, however, hardly kept pace with the theatre's income.

MARY MARTIN and Kenny Baker in *One Touch of Venus*, a successful musical of 1943 on Broadway

As the best new play of the 1942–43 season the New York Drama Critics' Circle awarded the palm to Sidney Kingsley's *The Patriots*, an eloquent handling of the theme of the young American democracy's fight for self-preservation. The principal characters were Jefferson, Washington and Hamilton. For its award, the Pulitzer committee selected Thornton Wilder's *The Skin of Our Teeth*, which the critics by a majority vote had dismissed from consideration on the ground that its originality had been widely questioned and that Wilder had allegedly borrowed his inspiration from James Joyce's little read novel, *Finnegans Wake*.

But if the more serious drama was lacking, there was no lack in amusing lighter fare. *The Doughgirls*, by Joseph Fields, a wartime farce laid in Washington, D.C.; *Dark Eyes*, by Elena Miramova in collaboration with Eugenie Leontovich, dealing with three eccentric Russian women week-ending on Long Island; and *Kiss and Tell*, by F. Hugh Herbert, a comedy of adolescence, offered amends in the laughter department. And in the way of musical shows *Oklahoma!*, with a lively score by Richard Rodgers; a satisfactory revival of Lehar's *The Merry Widow; Something For the Boys*, with tunes by Cole Porter; a modern paraphrase of Bizet's opera under the title *Carmen Jones* with a Negro cast; *One Touch of Venus* and several others assisted in making the public forget to a degree the torpor in the more sober dramatic department.

There continued to be no end to the war plays, most of which

were worthless. *Cry Havoc,* by Allan R. Kenward, and *The Russian People,* by Konstantin Simonov, both of which appeared just as the curtain was about to descend on the previous year, were cheap melodramas, and these were followed by equally commonplace exhibits—all, like them, failures—called *A Barber Had Two Sons,* by Thomas Duggan and James Hogan; *Counterattack,* derived from the Russian by Janet and Philip Stevenson; *This Rock,* by Walter Livingston Faust; *Men In Shadow,* by Mary H. Bell; *The Family,* derived from Nina Fedorova's novel of the same name by Victor Wolfson; *Sons and Soldiers,* by Irwin Shaw; *Land of Fame,* by Albert and Mary Bein; *et al.* Only *Tomorrow the World,* by James Gow and Arnaud d'Usseau, treating of a small boy indoctrinated with the nazi philosophy and his moral rehabilitation, caught the public's fancy, which was in some measure deserved since the play was the only even relatively satisfactory one in the lot.

Many of the established American playwrights remained absent from the scene. There was no representation by Eugene O'Neill, although he had completed a number of new plays, nor by Robert Sherwood, Lillian Hellman, George Kaufman, Paul Green, Marc Connelly, and S. N. Behrman, among others. Elmer Rice came a critical cropper with a machine-made study of maternity, interlarded with his customary doses of social significance, called *A New Life.* Maxwell Anderson was represented at the end of the year by still another war play, *Storm Operation,* written at the suggestion of General Eisenhower, which was below his best mark. Rose Franken, author of *Another Language* and *Claudia,* distinguished herself, however, when all seemed lost, with a serious play titled *Outrageous Fortune.* John Van Druten supplied an additional pleasant comedy in *The Voice of the Turtle* and William Saroyan disappointed his admirers with an indifferent comedy called *Get Away, Old Man.*

Among the better known players, Helen Hayes wasted a first-rate performance on a poor biographical play about Harriet Beecher Stowe called *Harriet,* the work of Florence Ryerson and Colin Clements; Katharine Cornell and Raymond Massey devoted themselves to a trivial little comedy, *Lovers and Friends,* by the English Dodie Smith; George Coulouris offered a stock-company performance as the villainous Richard III in the Shakespeare drama of that name; Ethel Barrymore continued to display herself in Emlyn Williams' *The Corn Is Green,* originally produced in November, 1940; Maurice Evans abandoned the stage for the period and gave his services to the entertainment of the armed forces in Hawaii; Elisabeth Bergner, the German actress banished by Hitler, proved as artificial as heretofore in a cheap melodrama, *The Two Mrs. Carrolls;* and Elsie Ferguson, returning to the stage after a long absence, came off with honours in the Franken play above noted.

There were two exhibits by men in the armed services. *The Army Play-By-Play* consisted of five short plays written, acted and produced by soldiers from the various military camps. Several of the playlets were entertaining. Moss Hart, who had written no play for the Broadway stage, gave his efforts instead to fashioning a show called *Winged Victory* for the U.S. Army Air Forces, which was of small merit but which was enthusiastically received upon its presentation to Boston and New York audiences.

Among the many revivals there were, in the musical field, aside from the before-mentioned, *The Merry Widow, The Student Prince, Blossom Time, The Vagabond King, Porgy and Bess, A Connecticut Yankee,* and the continuing highly successful *Rosalinda* (*Die Fledermaus*). In the dramatic field there were reproductions of *The Milky Way, Boy Meets Girl, Run Little Chillun, The Petrified Forest,* and *Goodbye Again,* none of them successful. Only the Theatre Guild's revival of *Othello* with Paul Robeson as the Moor met the public's fancy.

Vaudeville, still essaying its renewed day in court, found favour in a show headed by Frank Fay, Bert Wheeler and Ethel Waters titled *Laugh Time.* An attempt called *Bright Lights,* however, ended in abrupt failure, despite the presence on the bill of Smith and Dale in their celebrated *Dr. Kronkhite* buffoonery and James Barton in his old favourite, *The Pest.*

The little summer theatres, because of the gasoline situation, were few and far between, and those that operated were considerably less successful than in previous seasons. And the New York amateur and semi-amateur organizations negotiated nothing in the way of real dramatic quality.

Among the better acting performances on the Broadway stage, aside from those of certain of the more established players, were those of Betty Field in *A New Life,* Eugenie Leontovich, in *Dark Eyes,* Cecil Humphreys in *The Patriots,* Virginia Gilmore in *Those Endearing Young Charms,* Rhys Williams in *Harriet,* young Skippy Homeier in *Tomorrow the World,* William Wadsworth in *Three Is a Family,* Morris Carnovsky in *Counterattack,* Terry Holmes in *Manhattan Nocturne,* Jose Ferrer in *Othello,* and Oscar Homolka in *The Innocent Voyage,* to name just a few.

In conclusion, the phenomenal *Tobacco Road* returned to Broadway, marking the eighth year of its showing, and *Life With Father* entered upon its fifth enormously successful year.

(G. J. N.)

Statistics of the Theatre in New York City, 1943 and 1942

	1943	1942
Productions	109	110
Musical comedies	30	26
Plays	79	84
Premières	71	73
Successful productions	20	17
Performers employed	1,856	1,679
Tickets sold	7,920,000	7,210,000
Approximate cost of productions	$2,500,000	$2,250,000
Number of shows booked for other cities	87	94

(X.)

Great Britain.—The British dramatists managed in 1943 to break through the idea that in times of total war managers should rely only upon light matters or old successes. J. B. Priestley in *They Came to a City* dramatized the hopes and fears of young and old when standing at the gateway of the future. Inevitably a play of this kind tends to be described as propaganda and doctrinaire; but, in this instance, there was a great deal of character, and not a little comedy as well as pathos, in the portrayal of various acutely drawn types, entranced or bewildered or even terrified by the prospect of a bright, adventurous new world.

James Bridie (Dr. Mavor of Glasgow) had so often disappointed his admirers by allowing his brilliant beginnings to wander on to lame or vague or elusive conclusions that his success with *Mr. Bolfry* gave general delight. For here was a comedy of ideas which remained an orderly, well-devised piece of play-making and did not become, as so often with Mr. Bridie, a mad gambol of fantastic notions. The scene is a manse in the West Highlands of Scotland in wartime where some young people, oppressed by a Calvinist minister's godliness, manage to call up the devil in the form of Mr. Bolfry and there is much ado in getting rid of him. Another new play of consequence was *Lottie Dundass* by Enid Bagnold, the well-known novelist and creator of *National Velvet.* This was a gripping study of an overwrought girl with madness in her blood and a fiery ambition in her heart. One lovely feature of the piece was the performance of Sybil Thorndike as the girl's much-enduring mother. War-plays yielded Terence Rattigan's *Flare Path* which effectively communicated the comedy as well as the ardours and endurances of life at a bomber station.

Distinguished revivals in London included a very "starry" presentation of Congreve's *Love for Love,* in which John Gielgud

led gaily a team of all the talents. Turgeniev's *A Month in the Country* also found great favour. Russian themes were naturally popular during the year, but there was more appetite for the pacific and amorous Russian scene of 1860, as Turgeniev so charmingly painted it, than for the prodigious battle-scape of Tolstoy's *War and Peace,* which was attempted in dramatic form with a multiple stage and huge cast. The story got lost in the stagecraft and signally failed to draw the public. Shaw was represented by *Heartbreak House,* in which popular revival Robert Donat, Edith Evans and other stars appeared. American importations continued to find large support: they included *Junior Miss, Arsenic and Old Lace* and *My Sister Eileen.*

In the country one of the year's most interesting developments was the provision of drama in the great hostels attached to the new ordnance and munition factories. These hostels housed many thousands of workers, mostly women, drawn from all over the country. They were of all classes and many of them had never seen an acted play before, being accustomed only to the cinema and mechanized entertainment. They began to respond most eagerly to the plays sent out on special hostel-circuit by C.E.M.A. (the Council for the Encouragement of Music and Arts). Several actors and actresses of high position became so interested in this pioneer work that they gave up many months to it. It was noteworthy that plays of a classical nature were among the most popular with hostel audiences, Ibsen's *Hedda Gabler* being one of them and Shakespeare's *Twelfth Night* (with Wendy Hiller and Walter Hudd) another.

In the provincial cities there were some hopeful experiences. The "Old Vic" company successfully reopened the Liverpool playhouse—one of England's most famous repertory theatres. Sir Barry Jackson did the same for the Birmingham playhouse, whose company had given so many stars of stage and screen to England and America. At Glasgow a new Citizens' theatre was inaugurated in the autumn—a brave innovation for wartime—and at Bristol the oldest English playhouse, the famous Theatre Royal known to Garrick, Kean, and most of the great figures of histrionic history, was saved from demolition by C.E.M.A., redecorated, and reopened successfully as a home for touring companies of special quality. (I. Br.)

Theatre Library Association. Theatre Library association is an organization of persons in libraries and museums, as well as private collectors and members of the theatrical profession, who are concerned with preserving and making accessible to the public the records of the drama and kindred fields of entertainment. The association, an affiliate of the American Library association, had its inception at a meeting in New York in 1937, called by the then-director of the New York Public library, H. M. Lydenberg.

The publications of T.L.A. are the *Broadside* and the *Theatre Annual.* The *Broadside,* usually issued twice yearly, to present news of work-in-progress, exhibitions, books by members, and topical notes, is edited by Mrs. Sarah Chokla Gross, 11 Newkirk ave., East Rockaway, Long Island, N.Y. *Theatre Annual,* whose second issue appeared in Dec. 1943, publishes articles, translations and illustrative plates, of permanent interest but difficult to find elsewhere. Editor: Richard Ceough, 42 West 35th st., New York 1, N.Y.

Membership in 1943 was 109. Officers of the executive board, 1943–44: President, George Freedley, Theatre Collection, New York Public Library, 476 Fifth ave., New York 18, N.Y.; secretary, Mrs. Sarah Chokla Gross, McCord Theatre Museum of Dallas; treasurer, Mrs. Elizabeth P. Barrett, Theatre Collection, New York Public library.

A traveling exhibition of photographs of historic stage models made by Dr. Elemer Nagy of Yale; and a soviet drama exhibit in New York arranged by Dr. Franz Rapp, with an opening lecture on contemporary Russian drama by Prof. H. W. L. Dana, were highlights of T. L. A.'s 1943 program. (S. C. G.)

Thyroid: *see* Endocrinology.

Tibet. A country of central Asia, lying N. and N.E. of the Himalayas, mainly a high tableland. Nominally a Chinese dependency, it is in practice independent. Area, about 450,000 sq.mi.; estimates of the population vary, but 2,000,000 is a probable figure. The religion is Lamaism, a late form of Buddhism modified by animism and primitive magic, and education is in the control of the many monasteries. The ruler is the 14th dalai lama (born 1933) enthroned in 1940 as Lingerh Lamutanchu.

The most important event during 1943 in Tibet was the discovery in April of a "divine child" at Lihwa, Sikang, who was chosen as the true reincarnation of the late panchan lama, who died in 1937. The panchan lama is the religious head of the Lama Buddhist Church, spread across Tibet and a great part of Mongolia.

Tibet's neutrality in the war was maintained, but there was no mistaking the country's pro-Allied sympathies. On Nov. 20, 1942, the government had sent, on behalf of the dalai lama and regent, members of the cabinet and the whole people, congratulations to the government of India on the Allied victory in Egypt. Messages of friendship and congratulation on the Allied North African victories were also sent to President Roosevelt during the early summer of 1943. (C. M. Cl.)

Timber: *see* Lumber.
Timor: *see* Portuguese Colonial Empire.

Timoshenko, Semyon Konstantinovich (1895–), Russian army officer, was born in Furmanka, Bessarabia, of peasant parents. He joined the Red army during the revolution of 1917, winning renown as a guerrilla leader. After the revolution he studied strategy in soviet military academies, and from 1935 to 1938 he commanded a number of Russian military districts. During the Russo-Finnish conflict, 1939–40, Timoshenko built a replica of the Mannerheim line just behind Russian positions and had his troops rehearse every operation before attacking the Finnish chain of fortresses. On May 8, 1940, he was appointed people's defense commissar and was given the rank of marshal, but he was transferred from this post July 20, 1941, and took active command of Russian armies on the western zone of the German-Russian front. On Oct. 23, 1941, he was shifted to the southern front, where he recaptured Rostov and Taganrog and routed the German armies. In Aug. 1942, after the recapture of this region by the Germans, Timoshenko was transferred to the northwestern front. A few months later, however, he returned to the southern front, where he commanded the drive that resulted in the second recapture of the Taman peninsula in Oct. 1943. For this achievement he was awarded the Order of Suvorov, first class.

Tin. Surplus supplies were developed for a number of nonferrous metals during 1943; although tin was not one of this list, it was reported late in the year that the stocks of tin in the United States were of the order of 100,000 tons, which, considering the conditions that prevailed in 1942 and 1943, was a good showing, but not good enough to justify any relaxation of control or of limitations in uses.

World Production of Tin
(Long tons)

	1937	1938	1939	1940	1941
Belgian Congo	8,900	7,300	9,700	12,500	13,000
Bolivia	25,100	25,400	27,200	37,900	42,740
China	10,500	11,200	10,900	?	?
Dutch E. Indies	39,800	21,000	31,400	44,400	53,000
Malaya	77,500	43,200	56,000	85,400	81,000
Nigeria	10,500	7,300	10,900	10,300	14,800
Siam	16,500	13,500	17,000	17,400	16,200
World total	209,100	140,700	184,300	237,800	250,000

Bolivia was the only producing country from which production figures were received. Output declined from 42,887 long tons in 1941 to 38,901 tons in 1942. Although there was a decline in 1942 because of disturbed conditions in the industry, the 1941 figure was somewhat better than the estimate for that year included in the world table.

There were many conflicting reports as to the capacity of the Texas smelter, but it was usually considered to be 50,000 tons a year of metal. Bolivia was understood to be the main source of ore, of which a considerable stock pile was accumulated before the smelter went into operation. Since the reported capacity was well over the Bolivian output, it was evident that ore must have been received from some other source, or else the surplus was drawn from the stockpile. It was announced late in Dec. 1943, that $350,000 had been made available for additional equipment in the plant, which would hardly have been required if the plant was not being utilized to capacity; this brought the total investment in the plant to $6,650,000.

The contract for the purchase of Bolivian ores by Metal Reserve company expired at the end of June 1943. No renewal of the contract was completed in 1943, but deliveries were continued as usual, under a temporary agreement, with settlements made at the old contract rate of 60 cents per pound of metal. The delay was partly due to failure to agree on the price to be paid under a new contract, the sellers holding out for an increase to 60½ cents. After the change in the Bolivian government, which took place late in the year, a new contract could not be legally completed until the new government had been recognized by the government of the United States. (*See* also METALLURGY; MINERAL AND METAL PRODUCTION AND PRICES.)

(G. A. Ro.)

Titanium. Imports of titanium ores into the United States are no longer reported. Shortage of shipping space and the uncertain conditions prevailing in India, the main source of supply, led to the installation of a plant for the treatment of the titanium-iron ores of Essex county, New York, which was planned to have a capacity of 800 tons daily of ilmenite concentrates.

(G. A. Ro.)

Tito: *see* BROZOVICH, JOSIP (TITO).

Tobacco. The 1943 total tobacco crop of all types was estimated in December by the U.S. department of agriculture to be 1,403,275,000 lb. compared with 1,408,717,000 lb. harvested in 1942 and a ten-year average of 1,349,896,000 lb. Acreage was 6% more than in 1942 and the yield per acre was 960 lb. compared with 1,023 lb. in 1942 and the ten-year average of 878 lb.

Flue-cured tobacco production was slightly below the total of 1942 but above the average. The Virginia and North Carolina old belt crops were both larger than in 1942; Virginia, 81,900,000 lb. in 1943 compared with 77,900,000 lb. in 1942 and North Carolina 204,955,000 lb. in 1943 and 201,400,000 lb. in 1942. The eastern North Carolina belt produced only 275,025,000 lb. in 1943 compared with 295,260,000 in 1942. There was also a decline in the South Carolina belt, 152,740,000 lb. in 1943 compared with 166,900,000 lb. in 1942. Georgia, Florida and Alabama each had larger crops together totalling 76,258,000 lb. in 1943 compared with 70,230,000 lb. in 1942.

The total of fire-cured types in Virginia, Kentucky and Tennessee was smaller; 68,523,000 lb. in 1943 compared with 71,510,000 lb. in 1942 and an average of 108,045,000 lb. The principal decline was in Virginia, because of the drought.

The burley tobacco crop, grown in ten states, was 12% above 1942; 385,386,000 lb. compared with 343,509,000 lb. in 1942 and an average of 322,486,000 lb. The planting of burley tobacco was extended over a long period in the spring of 1943 because of the wet weather and shortage of labour. The leaf was heavy, however, and the yield 976 lb. per acre compared with an average of 855 lb. The acreage was large, 394,700 ac., compared with an average of 377,410 ac.

The Maryland tobacco crop was the smallest on record as the result of the drought. Production in 1943 was only 17,604,000 lb. compared with 28,120,000 lb. in 1942 and an average of 28,518,000 lb. The acreage was reduced somewhat but the yield was only 540 lb. per acre compared with an average of 756 lb. in 1932–41. The dark air-cured crops of Indiana, Kentucky, Tennessee and Virginia were smaller than in 1942 and the average.

All cigar types of tobacco yielded a crop of 108,312,000 lb. in 1943 compared with 118,573,000 lb. in 1942 and a ten-year average of 114,928,000 lb. This was because of a reduction in acreage which was 80,600 ac. in 1943 compared with 89,700 ac. in 1942 and an average of 89,000 ac. The yield was better than average. Of these cigar types the decrease was 11% in the filler class and 9% in the binder class. Wrapper tobacco showed an increase of 6% over that of 1942. There was some hail damage in the Connecticut valley and from drought and frost in Pennsylvania. The total production of cigar filler types was 47,645,000 lb. compared with 53,620,000 lb. in 1942. All cigar binder types produced 50,840,000 lb. compared with 55,711,000 lb. in 1942 and slightly below the average. Cigar wrapper types totalled 9,827,000 lb. compared with 9,242,000 lb. in 1942 and an average of 8,608,000 lb. The crop of Louisiana perique was estimated at 150,000 lb. compared with 70,000 lb. in 1942 and an average of 149,000 lb.

Consumption of tobacco continued at high and increasing levels during 1943. Flue-cured tobacco was used in record quantities due to the high domestic consumption of cigarettes. Lend-lease shipments were smaller because of the policy not to supply civilians. The latter were supplied by sales through regular trade channels. Prices for this tobacco averaged near the 1942 level. The burley tobacco supply was somewhat lower than the average of 1940–42 and its use was increasing since about 50% of it was used in cigarettes. The production of the lower priced cigars and smoking tobacco declined in 1943 while the use of snuff and chewing tobacco increased because of the prohibition of smoking in munition plants. The general rising purchasing

U.S. Production of Tobacco by States, 1943 and 1942

State	1943 lb.	1942 lb.	State	1943 lb.	1942 lb.
No. Carolina	553,680,000	574,400,000	Florida	14,810,000	14,778,000
Kentucky	328,811,000	289,405,000	Indiana	9,505,000	8,880,000
Virginia	106,878,000	104,105,000	Massachusetts	8,185,000	9,024,000

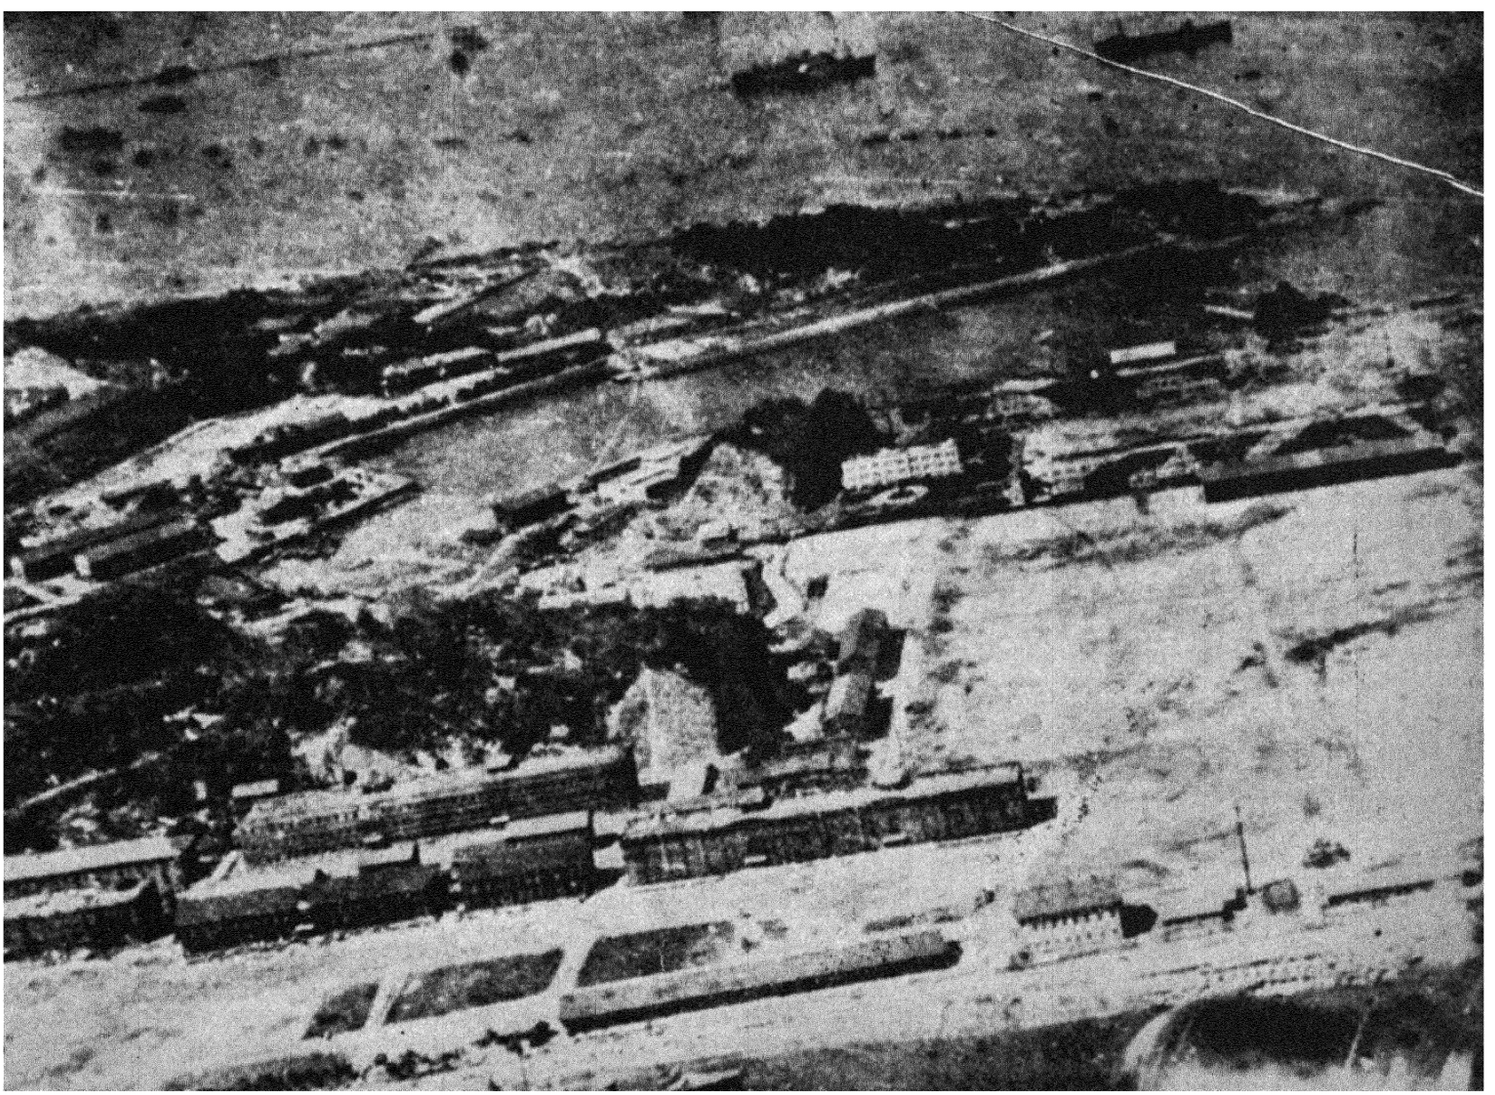
Togoland: *see* MANDATES.

Tojo, Hideki (1884–), Japanese army officer and statesman, was born in Tokyo, the son of Gen. Eikyo Tojo, master strategist of the Russo-Japanese war of 1904–05. A graduate of the Military Staff college, in 1915, he went to Germany in 1919 as military attaché and studied military strategy. On Oct. 18, 1941, Tojo, then a lieutenant general, became premier after Prince Konoye resigned under a bombardment of criticism for his failure to better relations with the United States without sacrificing Japan's ambitions to create a "new order" in the far east. Tojo also took over the war and home ministry portfolios. On Dec. 13, 1941, six days after Japan attacked Hawaii, Tojo said Japan was "fighting in self-defense and the cause of righteousness."



In Feb. 1943 Tojo was given dictatorial economic and political powers; a month later these powers were increased. In successive reorganizations of his cabinet he further added to them by assuming the portfolios of the minister of education and the minister of commerce and industry. Throughout the year his messages to the Japanese emphasized the gravity of the situation and the growing power of the Allies. On Dec. 8 he predicted a Japanese victory in 1944, but warned that the victory would not be an easy one.

Tokyo. The capital and largest city of Japan. Pop. (1940) 6,778,804; area, 257 sq.mi.; situated at 35° 41′ N. and 139° 45′ E. at the head of the bay of the same name on the southeastern coast of Honshu, largest of the Japanese islands. There were 1,029,695 buildings and dwelling houses in the city (1937).

Except for the surprise raid of General James Doolittle's air force on April 18, 1942, there had been no direct attack on Tokyo up to the end of 1943. But toward the end of 1943 Premier Hideki Tojo and other high officials began to sound insistent warnings about possible future air attacks, and plans were announced for emergency civilian occupation, for widening of streets and for emergency fire-fighting measures.

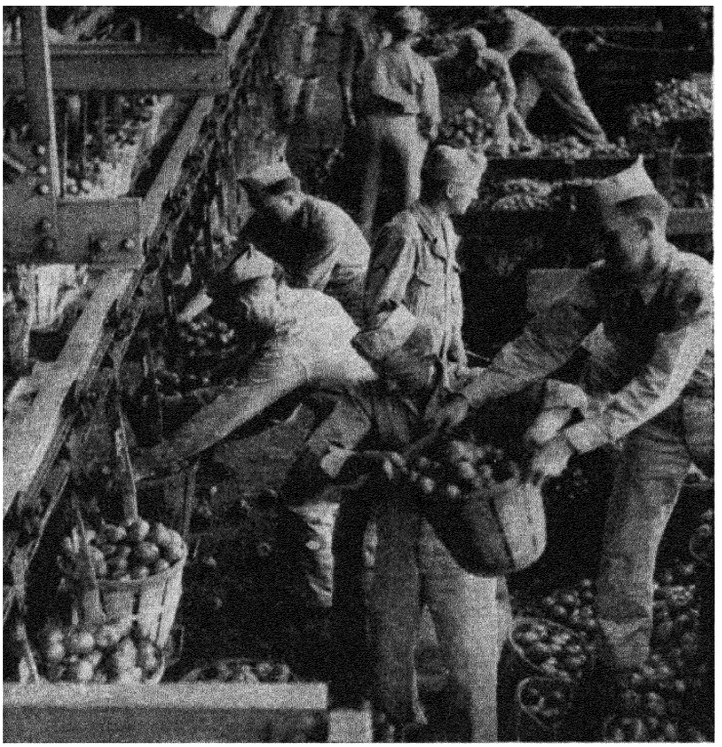
Tokyo is a self-governing municipality, with an elected city council and board of aldermen and a mayor, selected by the city council, at the head of the administration. The municipal budget for 1939–40 was 256,394,000 yen. Elementary and middle schools, utilities and public services of various kinds are under the direction of the municipal administration. But police and fire protection measures are reserved for the prefectural authorities. There were 1,906 elementary and middle schools of all types in Tokyo in 1937, with 1,118,399 pupils. There were 104 higher schools, including 22 universities, with 107,302 students. At the end of 1936 Tokyo contained 14,329 factories, employing more than five workers each, with 403,095 workers. There were 29,633

YOKOSUKA NAVAL BASE photographed from one of the U.S. bombers that raided Tokyo April 18, 1942. The photograph was released shortly after the first anniversary of the raid in 1943

small workshops, with 47,251 operatives. These figures doubtless increased considerably in later years, because of the expansion of the munitions industries. (W. H. CH.)

Tolbukhin, Fedor (? –), Russian army officer, was commander of one of the Russian armies that destroyed Marshal Friedrich von Paulus's Sixth German army at Stalingrad. An excellent tactician, Tolbukhin was highly regarded as one of the more able of the younger Russian commanders. His achievements were recognized by the Russian high command, and he was twice promoted in 1943, reaching the rank of colonel general. An expert in the use of cavalry and tanks, he crushed German defenses at Taganrog in 1943 in a daring manoeuvre. As a result, the Germans lost an estimated 35,000 dead on the Taganrog battlefield. His force laid siege to the city of Melitopol for 11 days and captured it on Oct. 23. The hand-to-hand fighting in Melitopol's streets was savage. His troops dashed across the Ukraine flatlands, plugged the German land outlet for its forces in the Crimea and seized Perekop Nov. 1.

Tomatoes. The total U.S. tomato crop of 1943 was somewhat less than in 1942 as estimated by the U.S. department of agriculture, primarily because of a smaller crop for canning, which offset the increase in production for the fresh vegetable market. The tomato crop for processing was put at 2,873,000 tons for 1943, compared with 3,166,700 tons in 1942 and an average of 1,813,800 tons for the period 1932–41. This was because of reduced yields, since the acreage in 1943 was considerably larger than in 1942. A smaller pack of tomatoes and tomato products resulted. Ceilings were fixed by the government and support prices provided to be maintained into 1944. Prices to growers ranged from 20% to 50% higher than in 1942. Between 25% and 30% of the pack was set aside for government purchases, including most of the new dehydrated lines, which were about three times as large as in 1942.



The tomato crop for market was estimated to be 37,102,000 bu. compared with 26,572,000 in 1942 and 22,634,000 for the 10-year period 1932–41. The increases were in the late crop since the early crop was much smaller in 1943 than in 1942. Prices were on a generally higher level than in 1942 and temporary ceilings were applied in some cases. Demand continued high and some increase in acreage was suggested by the War Food administration for 1944. (*See* also MARKET GARDENING; TRUCK FARMING.) (J. C. Ms.)

U.S. Seasonal Acreage and Production of Tomatoes for Fresh Market, 1943 and 1942

Crop	Acreage		Production	
	1943	1942	1943 bu.	1942 bu.
Fall	10,500	15,100	1,055,000	789,000
Early (1)	5,900	14,200	885,000	1,647,000
Early (2)	43,750	42,200	3,644,000	4,067,000
Second early	50,300	44,500	3,973,000	3,598,000
Intermediate	48,850	47,850	7,457,000	7,215,000
Late (1)	57,630	48,850	9,346,000	8,434,000
Late (2)	4,500	4,700	742,000	822,000

Toronto. Second largest city of Canada and capital of the province of Ontario, Toronto had a population of 667,457 in 1941 and an estimated population of 669,130 in 1943. Area 35 sq.mi. In 1943, though the greater part of its facilities continued to be devoted to war purposes, Toronto maintained its importance as a manufacturing and distributing centre. Transcontinental and local railway services and the city-owned street railway and bus lines functioned well in spite of greatly increased traffic, as did the hydroelectric distribution system, also city-owned. The municipal tax rate was lowered for 1943, and the city's capital debt was reduced during the year. The hydroelectric system rebated to its customers one-half of one monthly account. During 1943 a contract was made for the construction of a new sewage disposal works. Construction by the dominion government of a large hospital for war casualties was commenced on Armistice day, Nov. 11, 1943. The city donated the extensive grounds required. The world-famous Canadian National exhibition, after 63 years of continuous operation, was discontinued temporarily in 1943, the site of 350 ac. and numerous buildings being required for war purposes. (G. R. G.)

Towers, John H. (1885–), U.S. naval officer, was born in Rome, Ga., January 30, and was graduated from Annapolis in 1906. One of the first men to qualify for naval aviation in 1911, he established a world's record endurance flight in a seaplane in 1912, and was assistant director of naval aviation during World War I. His competence in aviation was quickly recognized and in May 1919 he organized and led a unit of flying boats that made the first transatlantic flight in history. He was assistant chief of the navy department's bureau of aeronautics, 1929–31, was commanding officer of the United States aircraft carrier "Saratoga," 1937–38, and was made chief of the bureau of aeronautics in June 1939. In the same month, he was made a rear-admiral. Adm. Towers was long an advocate of naval air expansion and was in the vanguard of the air-minded officers who fought for a vast naval air expansion program. In Sept. 1942, he was promoted to rank of vice admiral and given command of the Pacific fleet air force.

Town and Regional Planning. In the United States, many cities prepared surveys and planned projects for the postwar period. These were facilitated by state legislation in more than 20 states to give local

governments authority to build up postwar reserve funds, draw up master plans for redevelopment projects, and operate development authorities for special projects. Many cities, at the suggestion of the late National Resources Planning board, operating under the powers of the Federal Employment Stabilization act of 1931, prepared six-year programs for public works which could be undertaken after World War II.

Assisted by the magazine *Fortune,* the city of Syracuse, N.Y., undertook to prepare a modern plan with the active participation and support of its citizens. The National Resources Planning board, before its demise, co-operated with three cities—Tacoma, Wash.; Corpus Christi, Tex.; and Salt Lake City, Utah—to apply a new master plan procedure. There was much public discussion concerning methods of redeveloping the blighted districts which have grown up in most cities. Federal-aid legislation was introduced into congress to facilitate municipal action.

The Omaha *World-Herald,* following the Citizens Conference on Planning at Omaha in June 1943, published a series of postwar planning articles entitled "What Will We Do with Omaha?" The Dallas *News,* which had long supported planning, ran a series of 12 articles on the future of Dallas, in connection with the revised plan being prepared by Harland Bartholomew and S. Herbert Hare.

A number of cities and regions issued reports during 1943, including St. Louis county, San Francisco, Cleveland, Chicago and Portland, Oreg. In Eugene, Oreg., the *Register-Guard* and a group of citizens inaugurated a self-help program for postwar projects and the city voted to raise cash reserves ready for postwar use. The Chamber of Commerce of the United States issued an account of how Albert Lea, Minn., devised a procedure for community postwar planning, jobs and production. Almost all of the larger cities considered new plans for airports and practically every city was making plans for through highways which, under a federal law, might for the first time participate in the regular federal aid on the plan applied from 1916 on to state highway systems. (*See* POSTWAR PLANNING.)

In Great Britain there was great planning activity in 1943. The Barlow, Scott and Uthwatt reports published in 1942, if adopted, would exercise a profound influence on planning and land-use patterns of local communities. The county of London plan, prepared for the London County council is built around the neighbourhood as the unit and includes better road and rail connections, extended parks and parkways, and a new distribution of facilities. Many reports, booklets and articles on town and regional planning were published during 1943 in England. (*See* also HOUSING.)

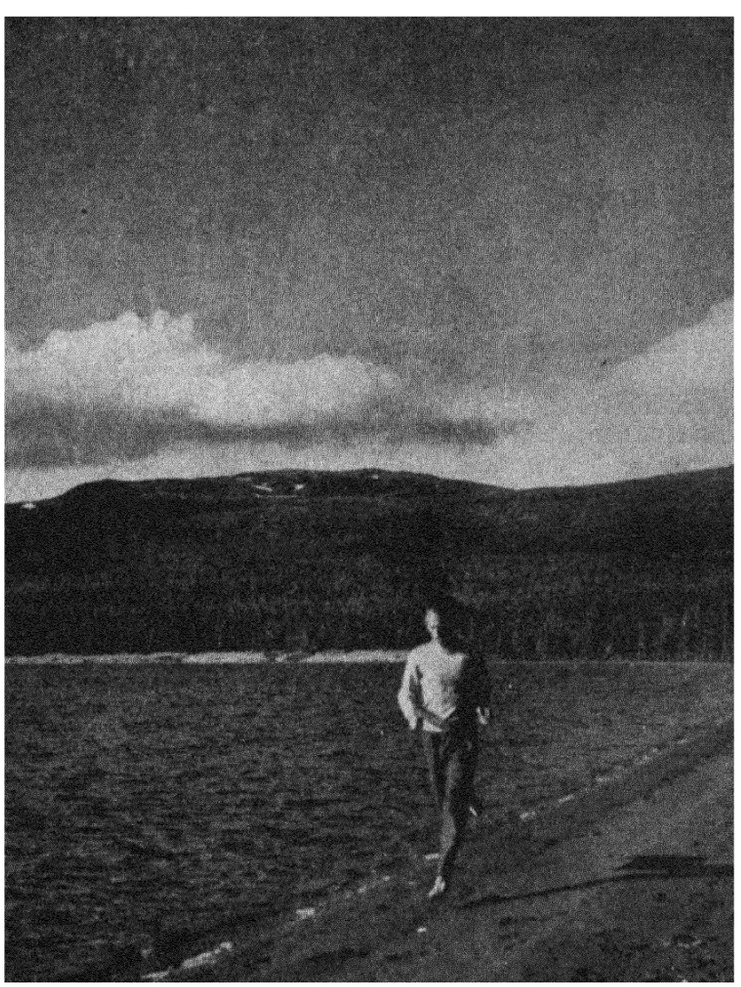
Track and Field Sports.



Once again the distance running of Sweden's Gunder Haegg (or Hagg) and Arne Andersson and the pole-vaulting of California's Cornelius Warmerdam highlighted an otherwise curtailed track and field program on American and other tracks.

Haegg made an eight-race tour of the United States during June, July and August. Although out of condition from a long sea voyage on a tanker, the Swedish star did not lose a race during his U.S. campaign and wound up with American records in the mile, two mile and 1,500-metre runs. He started with the two mile in the National A.A.U. by winning over Greg Rice, stellar American distance runner, and 20 days later set an American record of 8 min., 53.8 sec. at Los Angeles. Later in the trip he lowered the mark to 8:51.3. The last half of Haegg's tour was devoted principally to the mile run, and late in July he set an American record of 4 min., 5.3 sec. Aside from establishing three U.S. records, the Haegg tour netted approximately $150,000 for the Army Air Forces Aid society.

While Haegg was barnstorming the United States, Andersson remained on native Swedish tracks to lower two of the world records Haegg set the previous year. Andersson's 4:02.6 in the mile was two full seconds below that of his compatriot, while his 3:45 in the 1,500 metre bettered Haegg's record time by 3.8 sec. A movement to bring Andersson to America during the summer failed, but a campaign was later started to have both Swedish stars perform in the United States during 1944.

After crashing the 15-ft. ceiling consistently for three years,

GUNDER HAEGG, Swedish track star who toured the United States in 1943, on a practice run near Väladalen, a Swedish sports centre

Warmerdam reached a new high of 15 ft., 8½ in. in his last meet of the 1943 indoor season at Chicago.

Greg Rice, the former Notre Dame runner, was once again omnipresent in the distance events of the 1943 winter meetings. Rice ended the winter season with his 65th consecutive victory over the longer routes and registered a world indoor record of 8:51.

Harold Davis, former University of California sprinter (in 1943, with the Olympic club of San Francisco), again scored a "double" in the National A.A.U. championships. As in the 1941 Intercollegiate championships, when questionable starting blocks deprived him of a record-equalling 9.4 sec. in the 100-yd. dash, Davis had a possible record nullified because of a strong following wind. His near-record came in the 200 metre final which he won in 20.2 sec., one-tenth under Jesse Owen's recognized world mark. Bill Cummins of Rice joined Davis as the double winners of the A.A.U. championships, winning both hurdle events. Aside from Davis' repeats in the 100 and 200 metres and Cummins' in the 110-metre high hurdles, others to retain their championships were: Cliff Bourland of Southern California in the 400 metre; Gil Dodds of the Boston A.A. in the 1,500, Ensign Warmerdam of Del Monte Pre-Flight in the pole vault, Frank Berst of the New York A.C. in the 56-pound weight and Ensign Bill Brown of Bainbridge, Md., in the hop, step and jump.

Lieut. Joe McCluskey of the U.S. navy reserve, a 31-year-old veteran of the American track, won his 24th National A.A.U. championship in running away with the 3,000-metre steeplechase title. He started winning A.A.U. titles in 1930 and his total is an all-time record.

Although its squad included only four men, the University of Southern California won its ninth straight National Intercollegiate track and field championship with a clean-cut victory over a group of eastern, mid-western and Pacific coast favourites. U.S.C. scored 46 points to 39 for California and 36 for Rice. New York university, the eastern favourite as a result of its I.C.4-A. championship, finished fourth with 32. Cliff Bourland led the Trojans with a first in the 440 and a third in the 220, while Jack Trout also contributed 16 points to U.S.C. with seconds in the 100 and 220-yd. dashes behind Davis of California. Edsel Curry's second in the broad jump and Doug Miller's third in the javelin completed the team work of the Southern California athletes. U.S.C. and California stood out on the Pacific coast; Michigan won both the outdoor and indoor championships of the Big Ten, and New York university topped the east with team victories in the A.A.U. indoor and I.C.4-A. outdoor championships.

Indoor Track.—The consistent winning of Rice, Warmerdam and Hugh Short of Georgetown, plus the ever-changing supremacy in the classic mile, featured the 1943 indoor season. Short tied the world record of 1:10.2 in the 600-metre run and was unbeaten in the middle-distance event before he went into the army in mid-February.

Winter-long competition in the mile run found honours almost evenly divided among Frank Dixon of New York university, Gilbert Dodds of Boston A.A., Earl Mitchell of the University of Indiana, and Don Burnham of Dartmouth. Dixon won the National A.A.U. indoor title, but Dodds turned in the season's fastest time of 4:08.5.

Herbert Thompson of Jersey City led the indoor sprinting with a world record-equalling 6.1 in the 60-yd. dash of the National A.A.U. meet. He later lowered the 45-yd. mark to 4.8 sec., but the distance was not recognized as a legitimate test by the A.A.U.

New York university became the first college team to win the Indoor A.A.U. team crown by edging out New York Athletic club, the defending champion, 27 to 26. N.Y.U. easily won the Intercollegiate Indoor championships with 48 points to 20½ for second-place Fordham.

Women.—Stella Walsh entered her 11th year of U.S. women's track and field dominance to carry the Polish Olympic Women's A.C. of Cleveland to the team championship in the annual A.A.U. tournament. Miss Walsh won three events—100-metre, 200-metre and broad jump—to score 30 points, the same total she contributed in 1942. Led by the former Olympic champion's contribution, the Cleveland Polish group dethroned Tuskegee institute as team champion with 87⅛ points to 77½ for the Negro school. Alice Coachman of Tuskegee was second in individual scoring with 28 points, including firsts in the 50-metre and high jump and a second in the 100-metre. Frances Gorn of Cleveland was the other double winner of the tournament with victories in the shot-put and discus throw.

Trailer Coaches.

From Oct. 1942 and during 1943, approximately 36,000 trailer coaches were manufactured for the purpose of temporarily housing war-workers and construction workers. These were purchased by the Federal Housing administration as a stop-gap housing expedient until more permanent accommodations could be provided.

Standard equipment of a trailer coach consisted of a mobile unit on either single or dual axles and wheels, 18 ft. to 24 ft.

long, 7 ft. 6 in. wide, 6 ft. 6 in. interior height. The interior could be divided into one, two or three rooms by means of movable partitions. Studio couches with sleeping accommodations for four persons, 6-volt and 110-volt wiring systems, oil heater, cooking stove, refrigerator, lighting fixtures, sink with attachments to be hooked up to city water supply, insulated floor, roof and walls, and adequate ventilation, were part of the regular equipment. Exterior coverings were of Homasote, Masonite, leatherette, steel or a number of other materials. Interiors were usually panelled in gumwood, birch, maple or mahogany.

Because of the lack of tires and axles in 1943, trailer coaches were moved to government locations where the running gear was removed and returned to a pool. This running gear could then be used to relocate trailers or move them from the factory to their destination. The trailer coach thus became a semi-permanent home, available for instant removal to other locations when necessity demanded. (P. E.)

Trans-Jordan. Trans-Jordan lies to the east of Palestine, bounded on the north by Syria, on the northeast by Iraq, on the southeast and south by Saudi Arabia.

It is an Arab principality which, under a local Arab administration, forms part of the British-mandated territory of Palestine (*q.v.*). Like the land west of the Jordan, it continued in 1943 under the supervision of the British high commissioner for Palestine and Trans-Jordan, Sir Harold Alfred MacMichael, represented in Trans-Jordan by a British resident, Alec S. Kirkbride. The prince of Trans-Jordan is Emir Abdullah ibn Hussein; the prime minister (1943), Tawfiq Abdul Huda. Area: 34,740 sq.mi.; pop. *c.* 350,000. Religion: Mohammedan, with about 30,000 native Christians. Capital, Amman, the ancient Rabbat Ammon. Chief cities: Amman (25,000), Es-Salt, Maan.

History.—During 1943 the country continued to be an important bulwark of the British efforts to consolidate the middle eastern front against any expansion of axis influences. Emir Abdullah adhered faithfully to all his treaty obligations, and under his leadership the Arabic tribes of the country remained loyal to the alliance with Great Britain. The prime minister of Trans-Jordan visited Egypt and discussed there with the prime minister problems connected with the future unity of all Arab lands. These negotiations were part of those carried on during the whole year among Egypt, Saudi Arabia, Iraq and all the other Arab countries to lay the foundations for a common Arab policy after the war.

Finance, Education, Communication.—In 1940–41 revenue amounted to £388,455 and grants in aid from the British government to £95,110, the expenditure to £465,807 on the ordinary and £44,766 on the extraordinary budget. The value of the local currency is identical with that of British currency. The public debt is insignificant; it amounted in 1943 to £155,107. The economic life of the country is still primitive, many of the inhabitants leading a nomadic or semi-nomadic life. Important are the phosphate deposits and the potash found in the Dead sea. Illiteracy is still wide spread, but the government spent £27,874 on education, and in addition there were numerous private schools. The Hejaz railroad runs through the country from north to south, but it is of less importance than the newly built 1,400 mi. of good motor road connecting the country with Palestine, Syria and Iraq. (H. Ko.)

Transylvania: *see* HUNGARY; RUMANIA.

Trap-shooting. The state of Ohio took possession of its 13th Grand American handicap in the 44-year history of the event when Jasper Rogers, 35-year-old Dayton war-plant toolmaker, won the 1943 title in a six-way shoot-off. Tied with five other marksmen with 97 targets out of a possible 100, Rogers knocked over 47 out of 50 to lead the shoot-off.

Paul Wagner of Lima, O., virtually had the Grand American handicap clinched in the extra shoot, but missed the last two targets to finish one behind Rogers.

The all-around championship of the annual shoot at Vandalia, O., went to Herschel Cheek, a police officer at Clinton, Ind., with 478 out of a possible 500. His father, Ben F. Cheek, won the Grand American in 1936. The younger Cheek also aided Indiana in winning the 1943 state team championship with 976 out of 1,000. Indiana also captured the champion of champions title on the performance of L. E. Smith of Peru. Smith was tied with Walter Tulbert of Detroit and Gene Wenz of Louisville, each with 99 out of 100, and won in the shoot-off with 49 in a possible 50. Further honours to Indiana came by the victory of Orla C. Booher of Farmland, Ind., in the North American Amateur championship. Booher broke 200 straight targets to win.

Rudy Etchen, shooting instructor at Navy Pier, Chicago, broke the last 65 targets in a row to repeat as National doubles champion. He scored 96 out of 100 as compared with his winning 94 last year. J. R. Hinkle of Corsicana, Tex., won the North American Professional title with 195 targets out of 200.

Skipper Winski, 17-year-old high school student from Wellsburg, W.Va., featured the women's firing in the annual tests with victories in the Grand American and the Preliminary handicap. She won both shoots with 90 targets out of 100. Miss Winski was the first woman to take two titles in the same year. James A. Sabata of David City, Neb., won the men's phase of the Preliminary handicap with 98 out of 100. Florence Mos of Cincinnati gave Ohio a place in the women's championships by winning the North American 16-yd. event. Tied with Mrs. George Cameron of Houston, Tex., the defending champion, in the regular shoot at 192, Miss Mos won the shoot-off with 23 targets to Mrs. Cameron's 22.

The 1943 Grand American was modified considerably because of war conditions. It was cut from four to three days and included 500 targets instead of the usual 950. (M. P. W.)

Treasury, U.S. Department of: *see* GOVERNMENT DEPARTMENTS AND BUREAUS.

Trebitsch-Lincoln, Ignatius (1879–1943), Hungarian-born Buddhist, came from Paks, Hungary, of orthodox Jewish parentage. He left home at the age of 18, became a converted Protestant in Berlin, studied at the Anglican seminary in Montreal where he became qualified as a curate and found a position as vicar of a church in Kent, England. He later renounced his vows, became secretary to a rich manufacturer, and was elected to the house of commons in 1910. After a three-year term on charges of forgery (1916–19), he was stripped of his British citizenship and expelled. He went to the United States, was expelled in 1922, and then migrated to the far east, where he became financial adviser to the Chinese Marshal Wu Pei Fu and later counsellor to Pu-Yi, Japanese puppet ruler of Manchuria. He next turned up in the robes of a Buddhist monk in Peiping in 1926. He returned to Europe in 1932 to seek converts to Buddhism, but was politely and firmly escorted to the border of each country he visited. He closed the last years of his adventurous career in relative quiet in Shanghai, where he lived as a Buddhist monk.

Trebitsch-Lincoln died in Shanghai, Oct. 7, according to a Japanese news dispatch.

Truck Farming. Total production of 11 major vegetables grown for canning and drying in 1943 was about 14% smaller than in 1942 but 50% larger than the 10-year average 1932–41, reflecting the very rapid growth in the processing industry. The total canned pack of vegetables was expected to be three-fourths that of the 1942–43 season but slightly larger than the 5-year average. The 1943 harvested acreage of truck crops for processing was 1,902,150, a reduction of 3% from the 1942 harvest of 1,968,050 ac. but 49% above the 10-year average for 1932–41 of 1,275,960 ac. Lighter yields were due to droughts in the area extending from the Ozarks eastward into Tennessee and in the Atlantic coast states of Maryland and Delaware. Yields of all truck crops except asparagus and beets were below 1942 but on the average above the 10-year average.

Table I.—*U.S. Production, Acreage and Price per Ton of 11 Truck Crops for Commercial Processing, 1943 and 1942*

	Acres		Production		Price per Ton	
	1943	1942	1943 tons	1942 tons	1943	1942
Asparagus	40,400	48,460	44,040	51,820	$151.30	$118.15
Beans, lima (shelled)	63,750	66,080	28,340	37,830	103.21	84.59
Beans, snap	154,720	135,260	255,400	233,500	93.90	74.88
Beets	17,630	16,730	138,700	131,000	20.99	15.17
Cabbage (sauerkraut)	12,840	15,000	95,500	161,300	21.83	7.96
Corn, sweet (corn in the husk)	495,010	485,610	1,134,700	1,282,500	18.36	13.44
Cucumbers (pickles)	82,530	107,910	145,320	199,370	40.00	33.34
Peas, green (shelled)	433,780	434,120	403,080	423,010	80.03	63.71
Pimentos	8,010	11,440	8,570	14,650	50.53	41.84
Spinach	30,030	46,240	82,000	114,400	53.00	38.72
Tomatoes	551,650	601,200	2,645,600	3,166,800	26.14	19.70

Table II.—*U.S. Cold-Storage Holdings of Frozen Vegetables, Dec. 1, 1943 and Dec. 1, 1942*

Commodity	Dec. 1, 1943 lb.	Dec. 1, 1942 lb.
Asparagus	5,804,000	5,937,000
Beans, lima	11,731,000	15,220,000
Beans, snap	15,145,000	5,906,000
Broccoli, green	1,810,000	860,000
Corn, sweet	17,346,000	6,838,000
Peas, green	47,506,000	35,077,000
Spinach	11,491,000	5,470,000
Other vegetables	28,120,000	8,107,000
Classification not reported	55,417,000	32,430,000

Since one-fourth to one-third of the vegetable pack was set aside for government purchase from the 1943 crop, the amount for civilian consumption was sharply reduced. A larger quantity was dehydrated than in 1942, but most of that was reserved for military and lend-lease uses.

A price-support program was in effect on eight important truck crops in 1943—tomatoes, sweet corn, snap beans, lima beans, green peas, beets, carrots and cabbage. Prices ranged from 20% to 50% above those of 1942. To encourage canning, the War Food administration announced in July a program to purchase, until July 1944, all quantities of 10 products offered at 95% of the canners' net ceiling price. (J. C. Ms.)

Trucks: *see* AUTOMOBILE INDUSTRY IN THE WAR; MOTOR TRANSPORTATION.

Truman, Harry Shippe (1884–), U.S. politician, was born May 8 in Lamar, Mo. After finishing high school he worked at sundry jobs, enlisted in the army during World War I and served overseas as a captain. With the aid of the Pendergast machine, he became judge of the Jackson county court, 1922–24, and was presiding judge, 1926–34. Truman was elected to the national senate in 1934 and was returned in 1940. Although he was sponsored originally by Boss Pendergast, Truman's sincerity and record were unquestioned. During his first senate term, Truman emerged as an investigator of talent while serving with the committee investigating railroads. Early in his second term, he was made head of a special senate committee created in Feb. 1941 to investigate the U.S. national defense program. Empowered only to investigate and recommend, the committee soon became a powerful instrument against waste and corruption in the fulfilling of war contracts. It saved $250,000,000 on army construction, shed light on I. G. Farbenindustrie's alleged cartel agreement with Standard Oil Company of New Jersey, disclosed hoarding of contracts by large firms at the expense of small, bared fake inspections of inferior steel, revealed manufacture of defective warplanes by a large plant and criticized dollar-a-year men as lobbyists for industry. In Dec. 1943, Truman blasted the war department for construction of the Canol pipe line, disclosing that $134,000,000 had been expended on a project that produced only 479 bbl. of oil daily.

Trygger, Ernst (1857?–1943), Swedish politician, was a jurist of long standing before going into politics in 1897 as member of the first chamber of the Swedish parliament. He held this seat for 40 years, was a leader in the Conservative party and succeeded to the premiership in 1923. This cabinet fell, however, in the following year. In 1928 he was named to the foreign affairs ministry, a post from which he resigned in 1930. He was a delegate to the League of Nations in 1929, but did not regard the League as a guarantee for peaceful peoples against aggressor nations. In the years following World War I he called for greater co-operation among Scandinavian countries, suggesting that they pool together as an organized force in European politics. He died in Stockholm, Sept. 23, according to an American-Swedish news exchange.

Tuberculosis. **Diagnosis and Case Finding.**—Every reactor to tuberculin has tuberculosis in some stage of its evolution; therefore, Collins, Lotz, Lyght and others emphasized the necessity of the tuberculin test in all examinations for tuberculosis.

The following examinations and findings for pulmonary tuberculosis were reported: in Uruguay of 134,209 persons examined, 13.4%; in Rio Grande do Sul, Brazil of 8,893 state officers and employees examined, 1.45%; in Santiago, Chile of 25,556 employees examined, 899; in Buenos Aires, Argentina of 62,349 persons examined, 3.08%.

Among 75,000 royal air force personnel gross tuberculosis was present in 38 women and 196 men, while among 30,000 recruits for the women's auxiliary air force 102 had tuberculosis. In 53,400 examinations of men in the army of the United States, active tuberculosis of the lungs was found in approximately 10 of every 10,000 examined. It was stated that among inductees for all services 1% had been rejected. The New York City Health department examination of 114,130 national guardsmen and selective service registrants revealed 435 with active and 721 with arrested pulmonary tuberculosis. In U.S. war industries of 194,986 persons examined, 1.3% had tuberculosis, of whom 53.6% were in the minimal, 43.3% in moderately advanced, and 3.1% in the far advanced stage.

Special Organizations and Projects.—Many Kentucky counties made mandatory X-ray inspections of the chest of each tuberculin reactor before graduation from high school. In Peoria, Ill., this was extended to every member of the school personnel. Of 73,000 college students tested with tuberculin, 21.8% reacted. In 311 colleges with tuberculosis control programs, 744 new cases

of tuberculosis were diagnosed among 558,075 students. The American School Health association devised a plan for certifying individual schools or whole school systems which met certain qualifications in the control of tuberculosis.

In New York state examination of 7,187 patients admitted to general hospitals (in whom tuberculosis was not suspected) disclosed 201 with reinfection type of disease. The Minnesota State Medical association recommended that all patients admitted to hospitals be examined for tuberculosis, as well as the personnel. Several states took cognizance of the seriousness of tuberculosis in institutions for the mentally ill and appointed full-time directors of these activities.

Examination of 1,000 pregnant Negro women at the Provident hospital in Chicago revealed 1.8% with active and 1.1% with inactive tuberculosis. This was approximately the same incidence as among non-pregnant women examined at the same hospital and in other parts of the country.

The Minnesota State Medical association continued to develop a state-wide tuberculosis control program, with Meeker county as its demonstration area. The Texas association developed a similar program. Eight Minnesota counties have been accredited, on the basis of low mortality and low infection rates.

Gross sale of tuberculosis Christmas seals in the United States amounted to $9,390,000 in 1942 and $11,000,000 was the 1943 goal. Most associations supported by seals worked on case-finding among industrial workers and following up rejectees.

Treatment.—In the United States there were 468 tuberculosis hospitals to which more than 100,000 patients were admitted. The problem of personnel was serious. This, with the discovery of large numbers of cases, made proper isolation facilities difficult in some places.

It was anticipated that many patients must be treated in their homes; hence, the National Tuberculosis association issued four manuals on *Home Care of Tuberculosis.*

In Chile 536 cases of pulmonary tuberculosis treated by ambulatory artificial pneumothorax did as well as 146 cases treated by pneumothorax in sanatoriums. This finding coincides with that of a number of tuberculosis workers in various parts of the world. Total surgical removal of a diseased lobe or an entire lung continued to attract considerable interest.

Investigations continued on the effects of the sulfonamides on tuberculosis in animals and man. Excellent results were obtained in animals. Encouraging reports were made on the effect on tuberculosis in man.

Mortality.—Throughout the world tuberculosis and malaria ran parallel as the first cause of death. In the South American nations tuberculosis was second.

In Rio de Janeiro it continued in first place, causing 17.76% of the deaths from all causes.

In Great Britain from 1939 to 1941 the increase in tuberculosis mortality was 11% for males and 13% for females. Tuberculous patients were evacuated from many institutions in Sept. 1939 and large numbers with contagious tuberculosis returned to society. The demand for labour brought into activity many persons evacuated from sanatoriums who still had contagious tuberculosis and spread it. The evacuation of town populations to the country resulted in children being supplied with raw milk containing tubercle bacilli. Among evacuated children up to the age of 10 there was a relative increase of 50% in mortality. The Medical Research council recommended: 1. All milk must be heated so that tubercle bacilli are killed. 2. Finding all unsuspected tuberculous persons. 3. Isolation of contagious cases. This was so effective that no more persons died in 1942 than in the prewar year 1938.

Among the French population tuberculosis increased 30% and in Paris there was an alarming number of consumptives between the ages of 50 and 60 years.

Of the United Nations the United States was unique in its tuberculosis death rate. Among Metropolitan industrial policyholders for the first nine months of 1943, it was 3.5% below that of 1942.

Tuberculosis Among Animals.—In Great Britain about 40% of the cattle had tuberculosis and over 6% of all farms distributed milk containing tubercle bacilli.

The incidence of tuberculosis among cattle in Argentina was 5%, while among milk cows it ranged from 25% to 70%. In 1941 over 22,000,000 lb. of meat were condemned. In Buenos Aires 25% to 40% of samples of raw milk were found to contain tubercle bacilli; in La Plata 15% to 25%; in Cordoba 12.2%.

Wight reported that in the United States between 1917 and 1943 the tuberculin test was administered to 262,235,544 cattle; 3,854,078 reactors were slaughtered. Of the 9,308,936 tested in 1943, only 0.18% reacted. Smith showed decrease of tuberculosis in man in close association with the control of the disease among cattle.

Inspection of carcasses of 56,867,080 swine slaughtered in 1943 resulted in sterilization or condemnation of 26,711 for tuberculosis. From 1925 to 1943 the tuberculin test was administered to 296,475,771 fowls, of which 4.4% reacted.

Prevention.—With no dependable immunizing agent available, emphasis was placed on protection against exposure to contagious cases by finding, isolating and retaining them in institutions, and keeping the disease in animals under control.

In England the ministry of health intensified the offensive against pulmonary tuberculosis by examining large numbers of apparently healthy persons. The government provided for special maintenance allowances so that those found to have the disease could undergo treatment.

It had long been advocated that all immigrants be examined on or before admission to any nation. This was first accomplished when Mexican workers taken to the United States to harvest in California were examined in Mexico City.

The Michigan department of health supervised examinations in Dallas and San Antonio of migrant field workers who sought employment in Michigan and neighbouring states, in an effort to prevent the entry of tuberculous workers. These procedures were borrowed from the veterinarians, who have used them for decades to prevent tuberculosis among cattle.

Tung Oil: *see* VEGETABLE OILS AND ANIMAL FATS.

Tungsten. The tungsten supply improved materially during 1943, after having been more or less short after the start of World War II. At the end of the year 1943 the supply was approximately in balance with the demand for war and essential industrial uses. While nothing was reported on output in the United States after 1941, it was known that new deposits were discovered and developed, to produce amounts of tungsten far greater than had been anticipated, and, in view of the conditions in China and Burma, it might well be that the United States was in 1943 one of the world's leading tungsten producers.

Portugal and Spain were the only sources of supply open to Germany. Both of these were at least nominally neutral countries, and there was sharp competition between British and German buyers, to secure the output, and prices ran up to fantastic figures. While the British supply was not all that it might be, it was far superior to the German, and British buying was as much a measure to keep the metal out of the hands of the Germans as to secure it for their own use. It was understood that the export regulations in Portugal permitted unlimited export of tungsten to either Great Britain or Germany, if it was produced in a mine owned by nationals of that country, but the output of other mines was allocated for export by the government. As a result of this ownership basis of export permits, it developed that in order to secure greater amounts for export to Germany, Germans were using devious legal manipulations in order to secure control of British-owned mines.

Spain was a less important producer than Portugal, the respective outputs of concentrates in 1942 being 1,045 and 3,175 short tons. During the first half of 1943 the output rate in Portugal dropped slightly, but in Spain it almost doubled.

Canada had only a relatively small output of tungsten, but developed some output as a war measure. The supply situation was improved to such an extent that no more government contracts would be placed, and the development work that was being done on some new properties was discontinued. Tunnels. There was no tunnel construction during 1943 except that which had some bearing on the world-wide conflict. World War I proved that tunnels as works of defense at fighting fronts were of doubtful value. However, in home defense the system of passenger transport tube tunnels at comparatively great depths below ground surface in London proved to be safe shelter from bombing raids; these tunnels lie within the non-water bearing earth stratum called London clay. On the other hand a tragic case of unsafe shelter in the highway tunnels under the river Elbe at Hamburg was reported in a Reuters dispatch of Aug. 24, which stated that 18,000 persons were drowned within these tunnels as a result of Allied air bombing. These iron-lined tunnels were in super-saturated sands of the riverbed.

New York city during the month of March 1943, placed 42 of its 85 mi. of Delaware Aqueduct tunnel into limited operation. This link of the project was in its final stages, lining of the rock bores with concrete at a rate of over 80 ft. per day.

The New York City Tunnel authority under an appropriation made by the state legislature made studies for the construction of a highway tunnel under the Narrows from Brooklyn to Staten Island; the tunnelling would be about 10,000 ft. long at great depth below the ship channel.

The first link of Chicago's passenger transportation tunnels was put in public operation during the month of October. This part of the system was the so-called State street line about five miles long.

The U.S.A. pioneer and highly successful highway in the twin Liberty tunnels at Pittsburgh, built over 20 years before, was greatly rehabilitated in 1943 with an improved drainage system, renewed surfacing of roadways, glazed tile lining, new lighting and improved carbon monoxide recording apparatus. These twin tunnels, about 6,000 ft. long, in the elimination of severe grades and long detours were built through solid rock ridge.

The building of a tunnel for the Chesapeake & Ohio railway through the Blue Ridge mountains was continued and excavation advanced to near completion towards the end of the year. This tunnel superseded one built in the '50s to the plans of engineer Col. Claudius Grozet. The old tunnel became inadequate to accommodate large modern cars, therefore the government permitted this new work to continue because of its freight-carrying capacity in prosecution of the war.

In northern California the Pacific Gas & Electric company completed the 23,200 ft. of its Pit River No. 5 aqueduct tunnel. This is a 19-ft. diameter tunnel for hydroelectric power, adding in these times 160,000 k.v.a. to the war production effort.

The city of Denver, Colo., conducted preliminary work on behalf of a very extensive projected addition to its water supply and incidentally electric power service, in the form of a diversion project on the Blue river. The plan included a tunnel, 22 mi. long, from near Dillon to the north fork of the South Platte river.

Of the two enormous 50-ft. diameter spillway tunnels at Boulder dam, the one on the Arizona side of the river suffered extensive erosion by scour at the foot of its steep inclination from the great hydraulic descent of over 500 ft. Its counterpart on the Nevada side remained intact. This damage was discovered in Dec. 1941, after the tunnel had been about four months in operation. The matter of restoration involving exploration, study and the work itself presented an intricate problem with the result the work, under considerable difficulties, was not completed until April 1943.

In London the war shortage of metals such as cast iron so generally used as a structural lining in shield-driven tunnels led to the use of a substitute, ferro-concrete, in the construction of the London Transport board tubes within the London clay. This new type of lining was in every respect similar to the standard troughed cast iron lining with segments bolted together through flanges longitudinally and transversely. The thickness of flanges and skin were necessarily greater than for cast iron and to the extent of increasing the displacement diameter by only 3 in. and at a reputed saving in cost of about 20%. This substitution permitted the building of stretches of tunnel, for air-raid shelter, which later could be absorbed in future tunnel extension.

Mexico City, or more strictly the Federal District of Mexico, added to its existing means of drainage and in so doing was driving a tunnel of a capacity of 1,920 cu.ft. per second, 7 mi. long entirely in rock. This city was also constructing a great addition to its supply of drinking water by a large project requiring the construction of a tunnel in rock about 9 mi. long and of 191 cu.ft. per second capacity. In the state of Puebla, Mexico, adjoining the city of Puebla, a tunnel in rock of a capacity of 1,765 cu.ft per second and about 7 mi. long was being constructed for the purpose of irrigation.

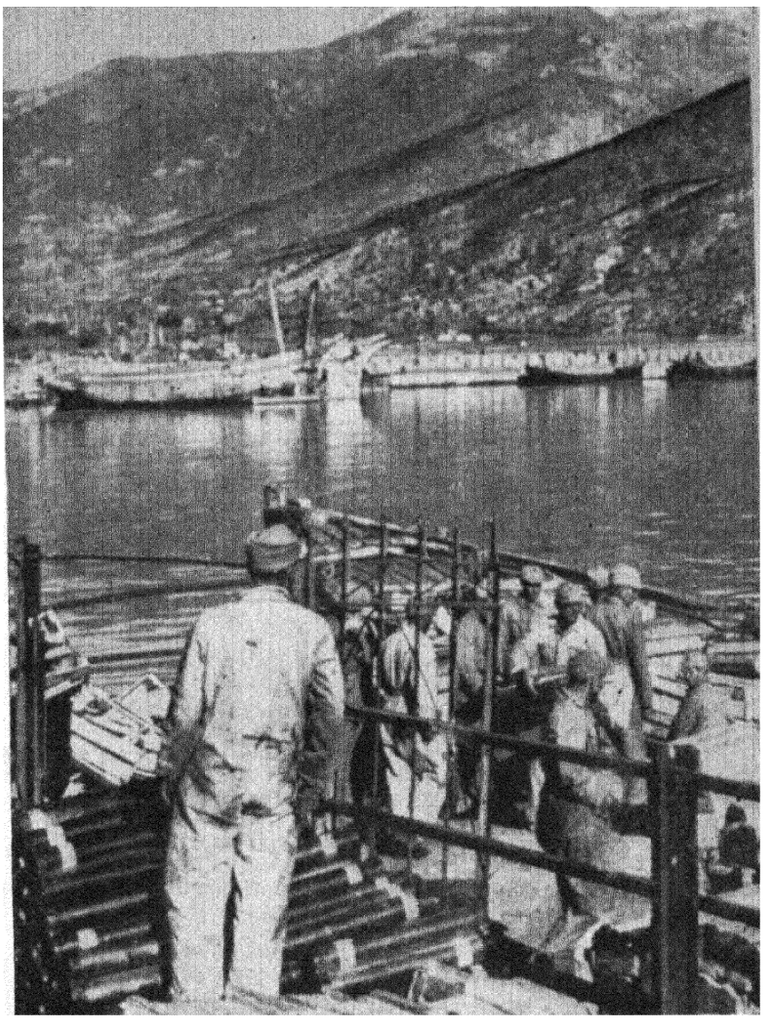
Turkestan, Chinese: *see* SINKIANG.

Turkey. A republic in southeastern Europe and western Asia. Area 296,500 sq.mi.; pop. (Oct. 20, 1940) 17,869,901. Capital, Ankara. Chief cities: Istanbul (789,346); Izmir (184,362); Ankara (155,544); Seyhan (89,990); Bursa

(77,348); Eskişehir (60,614); Gaziantep (57,314). Religion, Mohammedan. President (1943), General Ismet Inönü; Premier, Şükrü Saracoğlu.

History.—On March 8, 1943, General Ismet Inönü was unanimously re-elected by the Turkish parliament for a second four-year term as president of the Turkish republic. Shortly afterwards elections were held. The new chamber, like the preceding ones, was composed of members of the Republican People's party, the official party. The cabinet remained on the whole the same except for four minor changes.



During the year Turkey reaffirmed in a more and more determined way her alliance with Great Britain and drew closer to the United States and to the soviet union. This shift in Turkish policy from neutrality to non-belligerency on the side of the United Nations coincided with the growing strength of the latter. After his conference with President Roosevelt at Casablanca, Prime Minister Churchill went to Turkey as a guest of the Turkish government and met President Inönü at the end of January at Adana near the Syrian border. As a result of this meeting "the bonds of friendship and mutual good will and understanding between Turkey and the United Kingdom (were) confirmed and still further strengthened. . . ." In continuing these talks, the British commander-in-chief in the middle east, General Sir Henry Maitland Wilson, visited Ankara from April 15 to April 19, to arrange for a flow of Allied war material to Turkey.

This new confirmation of the alliance with Britain was followed as a result of British and American diplomatic efforts by a rapprochement between Turkey and the soviet union, which was officially confirmed by the Turkish premier in a speech delivered on June 15 before the final session of the sixth congress of the Turkish Republican People's party.

The climax in the improved relations between Turkey and the United Nations was reached when the Turkish president met with President Roosevelt and Prime Minister Churchill in Cairo on Dec. 4–6, 1943. The official communiqué stated that the Cairo meeting bore "striking testimony to the strength of the alliance which unites Great Britain and Turkey, and to the firm friendship existing between the Turkish people and the United States of America and the soviet union. The study of all problems in a spirit of understanding and loyalty showed that the closest unity existed between the participating countries in their attitude to the world situation. The conversations have consequently been most useful and most fruitful for the future relations between the four countries concerned." The closer alliance between Turkey and the United Nations did not fail to produce a deep impression on the peoples of the Balkans, especially on the axis satellites, and by the end of the year feverish German military preparations in Bulgaria, and Turkish counter-measures were reported.

A tax law adopted in Dec. 1942 had provided that tax payers who did not settle their debts within one month would be compelled to labour on public works until they had completely settled their debt. Unfortunately the tax was assessed in 1943 in secret commissions without the right of appeal and was handled in such a way that while it was applied most leniently towards Mohammedans, it was so severely handled in the case of Greek and Yugoslav nationals and the Christian (mostly Greek and Armenian) and Jewish minorities of Turkish nationality, that many of them were forced out of business and were transported to labour camps in the distant parts of eastern Anatolia. This procedure aroused protests, not only by the Turkish minorities but also by the Greek and other governments whose nationals were involved, and Turkey decided on Dec. 2, 1943, to release the tax defaulters, whose number was estimated at 30,000.

Education.—In 1940 there were 9,739 schools with 26,282 teachers and 1,049,816 students. The total expenditure on education by the government in 1940 was £T.32,507,374. There were two universities, one in Istanbul and one in Ankara.

TURKISH TROOPS unloading crates of U.S.-made bombs shipped to Turkey under lend-lease agreement in 1943

Finance.—Revenue for 1942–43 was estimated at £T.394,328,340, expenditure at £T.394,326,938. The public debt amounted on May 31, 1939 to £T.619,385,681. The monetary unit is the Turkish pound (£T.) valued at approximately 76 cents U.S. in 1942.

Trade and Communication.—Trade naturally showed the fluctuation of wartime conditions. In 1940 imports amounted to £T.68,900,000 and exports to £T.11,400,000. The chief importers to Turkey in 1940 were Italy, Great Britain, Germany and the United States, while the Turkish exports went to Italy, United States, Great Britain and Germany. Turkey imported mineral oils and coal, machinery, iron and steel manufactures, cotton piece goods, paper and paper manufactures, chemicals, tea, coffee and cocoa, and rubber manufactures. The principal exports were tobacco, cotton, hazelnuts, mohair, olive oil, raisins, wool, opium, chrome, barley.

Turkey had on July 1, 1940 a merchant marine of 290 ships of 217,381 gross tons. The length of the railway lines on Dec. 31, 1940 was 4,609 mi., of which 4,339 mi. were owned by the state.

Agriculture and Industry.—The Turkish government in the early 1920s undertook a program of industrialization, and a number of modern textile, paper, glass and other factories were constructed. Yet the main industry of the country remained agriculture, which also was being modernized with the help of the government. Besides cereals, tobacco, opium, figs, raisins, nuts and almonds are grown. Silk, mohair, skins and hides and olive oil are important products, and the breeding of sheep and goats is of great importance. (H. Ko.)

Tussaud, John Theodore (1858–1943), British sculptor and director of Mme. Tussaud's famous Waxworks museum in London, was born May 2 in Kensington. He was the great-grandson of Mme. Tussaud, founder of the original museum which included models of the victims of the French revolution, a collection originally carved in wood to withstand the rigours of travel. Tussaud contributed over 1,000 models of famous celebrities of his period and wrote *The Romance of Madame Tussaud's* (1920). Tussaud died in London, Oct. 13.

Twentieth Century Fund. A nonprofit organization in the U.S. for research and public education on economic questions, it was founded in 1919 and endowed by the late Edward A. Filene, Boston merchant and philanthropist. The entire income of the fund is devoted to its own research and educational work.

The fund is governed by a board of trustees—composed of leaders in education, business, government and the professions—who serve without compensation and are zealous in maintaining the nonpartisan character of all fund activities.

The fund's basic aim is to help the American people solve some of their chief economic problems by objective fact finding and the formulation of programs for action. For each survey a research staff is set up to find the facts. The research findings are reviewed by a special committee of qualified citizens of diverse views who then formulate policies in the public interest. The fund itself expresses no views in its publications and the research staffs and committees are given complete freedom in their work. Both the factual findings and the program for action are published in book form and are further given the widest possible circulation through the press, pamphlets, radio programs, etc. Surveys deal with such subjects as taxation, the costs of distributing goods, housing, collective bargaining, the electric power industry, and postwar economic problems and activities.

After 1942, a major part of the fund's resources was devoted to the economic problems to be faced in the postwar era. The officers of the fund in 1943 were: John H. Fahey, president; Henry S. Dennison, chairman, executive committee; Percy S. Brown, treasurer; Evans Clark, executive director; J. Frederic Dewhurst, economist. Address: 330 West 42nd street, New York 18, New York. (E. CK.)

Ulyanov, Dmitri (1874–1943), Russian politician and medical research scientist, younger brother of Nikolai Lenin, was born in Simbirsk (now Ulyanovsk). He studied at the Simbirsk gymnasium, at Kazan and Samara universities and was graduated from the latter school in 1893. The following year he entered the medical faculty of the University of Moscow. He became a revolutionary after the death of his eldest brother, Alexander, who was executed in 1891 for having belonged to the terrorist group that attempted, unsuccessfully, to assassinate Tsar Alexander III. Dmitri Ulyanov joined the Marxist student circle at the University of Moscow and became actively connected with the workers' revolutionary committee. He was jailed in 1897, paroled the next year, and completed his medical studies at Yurevski university, 1901. He then joined the state service as physician. He held his revolutionary activity in check during his brother's exile and in 1903 joined the staff of the *Iskra* (*The Spark*), a newspaper founded by Lenin. Dmitri Ulyanov joined the bolshevists and was a member of the bolshevist centre in Kiev. He was again arrested in 1904 and again imprisoned for his revolutionary activity. During the bolshevist revolution, he was staff member of a bolshevist newspaper in Sevastopol; in 1919 he became a member of the revolutionary committee of the Communist party and later replaced Bela Kun as vice-chairman of the Crimean Soviet republic. After the revolution, he resumed his medical work and served successively with the Commission of Health, the Communist Institute for Health and the scientific department of the Polyclinic at the Kremlin. He died at Gorki, July 16.

Unfederated Malay States. One of the three principal subdivisions of British Malaya (*see* also STRAITS SETTLEMENTS and FEDERATED MALAY STATES). Area, 22,276 sq.mi.; pop. (excluding Brunei), est. 1939, 1,918,831. These principalities were occupied by Japan in the first months of 1942. Four of them, Kedah, Perlis, Trengganu and Kelantan, were transferred to the possession of Thailand by a decision of the Japanese government in 1943. In normal times the states are under indirect British rule, with native Sultans accepting advice on matters of policy and administration from British residents. The largest, richest and most populous of these states is Johore, at the southern tip of the Malay peninsula. Its revenue in 1940 was 24,737,590 Straits dollars, its expenditure 23,548,568 dollars. Its exports were 138,214,062 Straits dollars, re-exports 1,933,979 dollars, imports 57,275,959 dollars. The area, population and capitals of the land states in 1940 (no later figures were available at the end of 1943) were as follows: Johore, 7,330 sq.mi., pop. 737,590, capital Johore City; Kedah, 3,660 sq.mi., pop. 515,758, capital Alor Star; Kelantan, 5,750 sq.mi., pop. 390,332, capital Kota Bharu; Trengganu, 5,050 sq.mi., pop. 211,041, capital Kuala Trengganu; Perlis, 310 sq.mi., pop. 57,776, capital Kangan. The inhabitants of these states are mostly Malays, except in Johore, where the Chinese outnumber the Malays. After rubber the most important products are rice and coco-nuts. (*See* also JAPAN.) (W. H. CH.)

Union of South Africa: *see* SOUTH AFRICA, THE UNION OF.

Union of Soviet Socialist Republics. A state of eastern Europe and northern and central Asia. Area (Aug. 1939) 8,175,500 sq.mi., over one-fifth of which lies within the polar circle; pop. (Jan. 17, 1939 census), 170,467,186. The general increase in the population of the U.S.S.R. for the period of 12 years to Jan. 1939 amounted to 23,439,271, or 15.9%, the rate of increase varying throughout the period. Sixty-four per cent of the population of the soviet union lived in the Russian Soviet Federated Socialist Republic (78% of the U.S.S.R. territory), the remaining 36% of the population being distributed almost in equal halves between the Ukrainian S.S.R. (2% of the territory) and the nine other union republics (total territory 20%). In Jan. 1939, Great Russians constituted 58.4% of the population (as against 53% at the end of 1926); Ukrainians 16.6% (21.2%); White Russians, 3.1% (3.2%); Uzbeks, 2.9% (2.7%); Kazaks, 1.8% (2.7%); Tatars, 2.5% (2%); Jews, 1.8% (1.8%); Azerbaijanis, 1.3% (1.2%); Georgians, 1.3% (1.2%); Armenians, 1.3% (1.1%). Altogether some 60 different ethnic groups are comprised in the union. The 140-odd languages and dialects spoken in the U.S.S.R. belong to the following groups: Indo-European, Caucasian, Semitic, Ural-

FOREIGN COMMISSAR VYACHESLAV MOLOTOV of the U.S.S.R. signing the Four-Power Pact of Moscow, terms of which were announced Nov. 1, 1943. Altaic (Finno-Ugrian, Samoyede, Turkic, Mongolic, Tungusic), Palaeo-Asiatic and Far Eastern. Capital: Moscow (4,137,018). Ten other cities had a population of more than 500,000 in 1939: Leningrad (3,191,304), Kiev (846,293), Kharkov (833,432), Baku (809,347), Gorki (644,116), Odessa (604,223), Tashkent (585,005), Tiflis (519,175), Rostov-on-Don (510,253), Dnepropetrovsk (500,253). Premier: Joseph Stalin (*q.v.*).

History.—In the military field, 1943 opened with the raising of the siege of Leningrad on Jan. 18. The summer of the year was to see the defeat of the German offensive against the Kursk salient, followed in the autumn by the recapture by the Red army of Kharkov, the Don basin, Briansk, Smolensk, Kiev and Gomel, and the clearing of the Taman peninsula and a German retreat beyond the line of the Dnieper.

Economic Situation.—On the economic side, 1943 was chiefly notable as the year in which soviet war industries were able to achieve a superiority, as regards the output of tanks, planes and artillery, over the war industry of Germany; as the year in which attention could once again be directed to improving the output of consumer goods industries, thereby relieving somewhat the burden of stringency that war and invasion had imposed on the civilian population; and as a year when the tasks of reconstruction, in the liberated areas, were begun. The year 1942 had seen soviet war industry, much of it (including one-third of all munition factories) evacuated during the previous winter from the war zone, firmly established in its new centres in the Trans-Volga region, in the Urals and in Siberia. Already in the summer of that year official statements had claimed that the production of arms and munitions in the new centres exceeded the prewar figure.

In October, *Pravda* claimed that in the course of the previous 12 months the output of pig-iron had grown 20%, of steel 12% and of coke 17%. It was officially stated that the output of ammunition during the first half of 1943 was 50% above that of the first half of 1942, while the output of certain types, such as new shells of unusually great armour-piercing capacity, increased by five, six or seven times. It appears that this increased output actually took place on the basis of a diminished labour force, since it was also stated that labour productivity increased between 70 and 80% over the same period. The arms workers of the Sverdlovsk district actually quadrupled their output in the first half of 1943, and proceeded to set themselves the target of improving on that achievement by 50 to 100% in the second half of the year. Statistics of tank and aircraft production were not made public; but there was reason to believe that increases in their case had also reached impressive dimensions. When the serious losses in economic potential that the U.S.S.R. had suffered from the German invasion are borne in mind, this resilience of soviet war production stands out as one of the most amazing features of the war.

Rehabilitation Problems.—With the German retreat from the Kuban and the Don regions in the winter, the problem arose of restoring, not only communications, but also civilian life in the ravaged and depopulated areas. With the soviet offensive of the late summer, liberating half the Ukraine, the problem acquired high priority on the agenda of immediate tasks. As one example, it was announced in April by the people's commissar of education of the Russian republic that some 5,000 schools, caring for nearly 500,000 children, had already been reopened in the liberated areas; and in the Rostov region alone 128 out of some 230 schools destroyed by the enemy were reported well on their way to restoration. Rebuilding was undertaken largely in the form of temporary wood structures, rapidly assembled from prefabricated parts, transported from regions where these could be mass-produced. A good deal of attention was paid to the question of improvised and novel building methods. At a conference of architects held at Moscow in the summer it was stated that already some 10,000 new buildings of all kinds had been erected since the start of war, and, as regards industrial building, a special research institute in Moscow had introduced numerous innovations in wood, concrete and stone construction as well as in the use of substitutes for cement and brick and in the extended utilization of three-ply boarding. A parallel institute concerned with house building was experimenting with "Orgalite" building blocks made from waste paper, with building blocks made from slag, and with aluminum-foil coatings for walls in postwar building. On Aug. 22 a special decree of the council of people's commissars outlined in considerable detail "immediate measures" to be taken "for the restoration of national economy in the districts liberated from German occupation." Chief among these was the return of evacuated livestock: some 600,000 horses, cattle, sheep and goats were scheduled as due to be re-evacuated by the middle of October, transfer in some cases to be from as far away as eastern Kazakstan. Between 5 and 10% of the tractors previously available in these regions was to be allocated to them to help in restarting mechanized agriculture on the collective farms, and the supply departments of the army were instructed to allocate captured booty wherever practicable to equip machine tractor stations in these areas.

RUSSIAN CARTOONIST'S DISPARAGEMENT of the famed German "Tiger" tank. The title is "Even a Tiger Does Not Save the Situation." The upper poster reads, "The German general offensive." Goebbels's poster reads, "It is not Germans who launch offensive, but the Soviet troops." The cartoon, by Boris Efimov, appeared in the *Krasnaya Zvezda*

Among financial measures, on June 10 the finance commissar was able to announce that the second 20-year state war loan, amounting to 12 milliard roubles, had been over-subscribed by 50% within one week of issue. This loan was divided into two parts: the one consisting of noninterest-bearing lottery certificates was issued to private individuals, the other consisting of interest-bearing paper was issued only for collective subscription by bodies such as collective farms and industrial institutions. From abroad, assistance in the shape of lend-lease supplies of war materials continued at least on the scale of the year 1942; and on Jan. 20 Edward R. Stettinius, Jr., announced that up to Jan. 1, 1943, lend-lease shipments to the U.S.S.R. from the U.S.A. had totalled over 3,000 tanks, nearly 2,600 planes and 81,000 vehicles, in addition to which Great Britain had supplied more than 2,600 tanks and over 2,000 planes.

The liberation of occupied territory also brought to light new evidence of the ruthless cruelty of the German authorities in relation both to war prisoners and the civilian population—cruelty which far surpassed ordinary wartime atrocities and revealed itself as a systematic policy, designed in high places, to enslave and exterminate on a scale unparalleled since the middle ages. These discoveries became the subject of a number of notes by the soviet government to foreign powers in the course of the year. Already on Nov. 4, 1942, a special commission of investigation had been set up, which included the metropolitan of Kiev, Nikolai Shvernik, of the trade unions, Andrei A. Zhdanov, Professors Burdenko, Tarlé and Trainin and the writer Alexei Tolstoy; and on Dec. 19, 1942, Foreign Commissar Vyacheslav Molotov had issued a note on "The Persecution of the Jews and Other Atrocities in the U.S.S.R." It stated that his government had "authentic information proving a fresh intensification of the Hitlerite regime of bloody massacre of the peaceful population throughout the territories of Europe occupied by the German-fascist invaders. . . ." Soon after the invasion of Riga, it was stated, the Germans shot more than 60,000 Jews, many of whom had been deported thither from Germany, so that there were "now no more than 400 Jews in Riga, living in a ghetto surrounded by barbed wire, access to which is prohibited," and "doomed to death by starvation." Similar massacres had occurred in Lithuania; at Lutsk in the Ukraine 20,000 Jews were herded together under pretext of re-registration and were shot; at Kiev and Dnepropetrovsk 60,000 people, including old women and children, of Jewish nationality "were exterminated in the first month of the occupation." In April 1943 the report of the commission of investigation at Vyazma, Gzhatsk and Rzhev named a series of German officers and gestapo chiefs, together with two N.C.O.s in charge of war prisoner camps, as responsible for atrocities occurring in these places, adding that "history knows no such wholesale extermination of a people." On May 11 Molotov submitted a further note to the ambassadors of foreign powers "regarding the mass deportation of soviet civilians into German-fascist slavery and on the responsibility of German authorities and private individuals for these crimes." It revealed details from German documents of the forcible seizure and transfer of some 2,000,000 persons into forced labour in Germany.

Foreign Relations.—In soviet Russia's relations with other powers the outstanding events in the course of 1943 were the rupture of relations between the soviet government and the Polish government in London; the holding in October of a three-power conference of the foreign ministers of the U.S.S.R., Britain and the U.S.A. in Moscow and, ending Dec. 1, the four-day conference of President Roosevelt, Prime Minister Churchill and Marshal Stalin at Tehran, Iran.

On Feb. 25 the foreign affairs committee of the Polish National council had issued a declaration that "from the moment of the conclusion of the Polish-Soviet treaty of July 30, 1941," they had "maintained the unchangeable attitude that so far as the question of frontiers between Poland and soviet Russia is concerned the *status quo* previous to Sept. 1, 1939, is in force." At the same time the declaration repudiated any hostile intentions towards the U.S.S.R. and denied that the Polish government harboured

ROLES REVERSED. Cartoon of 1943 by Shoemaker of the *Chicago Daily News* entitled "Russian Peace Plan"

any designs to extend Poland's eastern frontiers to the Dnieper and the Black sea. This evoked the reply through the soviet news agency that the declaration bore witness to "the fact that the Polish government refuses to recognize the historic rights of the Ukrainian and White Russian peoples to be united within their national states." On April 12 the German news agency announced the discovery near Smolensk (in the Katyn district) of mass graves of 10,000 Polish officers whom they alleged had been killed by the Russians in 1939, an announcement characterized by the soviet information bureau as a "vile fabrication." The day following the soviet denial, the Polish minister of national defense, General Marjan Kukiel, issued a statement calling for an investigation into the Katyn graves by the International Red Cross, in view of the "detailed information given by the Germans concerning the finding of the bodies"; while the Polish cabinet announced that on the previous day they had already applied to the International Red Cross for an investigation. The International Red Cross intimated that it had received applications in the same sense from both the Polish government and the German Red Cross, but declined to act in the matter. The soviet press proceeded to charge General Wladyslaw Sikorski's cabinet with "swallowing a carefully baited hook thrown out by the German propaganda agencies"; and on April 25 Foreign Commissar Molotov handed a note to the Polish ambassador, Tadeusz Romer, severing diplomatic relations with the Polish government, on the ground that "the recent behaviour of the Polish government with regard to the U.S.S.R." was "entirely abnormal and violated all regulations and standards of relations between two allied states." This was followed by a statement by Andrei Vishinsky to the representatives of the British and U.S. press, attacking the Polish government for "provoking the soviet suspension of diplomatic relations under the influence of the pro-Hitler elements within it and within the Polish press"; denying that the soviet authorities were hindering Polish subjects from leaving the U.S.S.R., or had any intention of forming another Polish government on soviet soil; and accusing representatives of the Polish embassy of having conducted espionage activities in the U.S.S.R. under the guise of charitable activities. Six days later, on May 13, the formation was announced in Moscow of a body known as the Union of Polish Patriots in the Soviet Union, which published a declaration of aims in the paper called *Wolna Polska*, including the following: "to help the Polish people under German occupation to achieve their liberation; to wage war side-by-side with the Red army against the enemy; to strive for the independence and sovereign rights of the Polish state and its parliamentary and democratic structure, and for the material and cultural well-being of Poles in the U.S.S.R.; and to strengthen the bonds between the soviet and Polish peoples." On the same day the formation was announced of a Polish division, the Kosciusko division, on soviet soil, under the command of Colonel S. Berling, formerly chief of staff of the 5th Polish division at Cracow. This was to be under the operational command of the Red army, though not part of it, and was to be recruited from among Poles from the Ukraine and from volunteers among Poles living in the U.S.S.R. prior to Sept. 1939.

On Nov. 1 the terms were announced in Moscow of the agreement reached at the Three-Power conference. These consisted of five main declarations; and as concrete immediate proposals it was agreed to set up a European advisory commission in London, with representatives of all three powers, with the object of consulting on all matters arising from the military occupation of Europe by the forces of the United Nations. (For the text of the pact of Moscow and related documents, *see* UNITED STATES.)

The meeting of the foreign ministers was followed in less than a month by a conference of Stalin, Churchill and Roosevelt at

HAULING PEAT for the supply of Leningrad. The German ring around the beleaguered city was broken Jan. 18, 1943

Tehran, Iran, Nov. 28–Dec. 1, 1943. For the first time since the Revolution, Stalin left the U.S.S.R., accompanied only by Foreign Commissar Molotov and a single military adviser—Marshal Klementiy Voroshilov. This long-expected meeting of the "Big Three" resulted in a declaration, dated Dec. 1, in which the three powers pledged mutual assistance "in the war and in the peace that will follow . . ." and concerted action to bring about the final destruction of all German armed forces. No mention was made of Japan; a separate statement guaranteed independence and postwar economic assistance to Iran (*q.v.*). (*See* UNITED STATES for the text of the Declaration of Tehran.)

A further political event of considerable importance affecting the relations between the soviet government and other nations was the adoption on May 15 of a resolution dissolving the Comintern by the executive committee of that body in Moscow.

Diplomatic events in the course of the year included the recall of Ivan Maisky as ambassador in London, following his appointment as a deputy commissar for foreign affairs, and his replacement by Fyodor Gusev, who had previously been appointed as first soviet minister to Canada in Oct. 1942, and also the recall of Maxim Litvinov as ambassador extraordinary to the government of the U.S.A. and in his place the promotion to ambassador of Andrei Gromyko, who had already acted as chargé d'affaires at the soviet embassy in Washington. Early in February an agreement was signed in Washington between Litvinov and the foreign minister of Colombia for an exchange of ambassadors between their two countries; and in April it was announced that both the Greek and Belgian governments had decided to raise their diplomatic missions in the U.S.S.R. to the status of embassies with reciprocal action on the part of the soviet government. On June 21 Constantine Oumansky, formerly soviet ambassador in Washington, presented his credentials to the President of Mexico as first soviet ambassador to the Mexican government; while Alexander Bogomolov, soviet ambassador to the Allied governments in London, presented his credentials to King Peter of Yugoslavia on June 8 (following a similar presentation of credentials to

WOMEN REMOVING DEBRIS from ruined Stalingrad in the summer of 1943 as the tide of German invasion receded farther and farther west. At the right is the shell of the department store where Marshal von Paulus surrendered the German 6th army to the Russians Jan. 31, 1943

President Eduard Beneš of Czechoslovakia in January). In the autumn it became known that the Czechoslovak government in London wished to enter into negotiations with the soviet government for a mutual assistance pact between the two countries; but at the request of the British government the visit of President Beneš to Moscow for this purpose was postponed until December.

The year 1943 also witnessed an increased attention in the U.S.S.R. to postwar problems in the international sphere; although stress continued to be laid repeatedly on the primacy of the military task of united struggle against fascism and the urgent necessity for creating a second front on the continent of Europe. The discussion journal, newly published in Moscow, entitled *War and the Working Class,* devoted considerable space to such questions; and the reference of Marshal Stalin, in his above-quoted reply to Reuters' correspondent, to "the future organization of a companionship of nations based upon their equality" was regarded by English commentators as possessing considerable significance. In May a soviet delegation participated in the United Nations conference on postwar food problems at Hot Springs, Va. Alexei Krutikov, chairman of the soviet delegation, in his address to the conference emphasized that "food supply problems are of great importance to the U.S.S.R. at the present moment, firstly because we require food now to supply the large army we maintain to defeat Germany, and secondly because food is needed to maintain the life and health of the plundered and impoverished people of the regions which the Red army is liberating. . . ."

Orthodox Church.—During September an event occurred which significantly affected the status of the Orthodox church in the U.S.S.R. With the prior agreement of the soviet government, a church council was held with the object of electing a patriarch, Metropolitan Sergii being duly elected as patriarch of Moscow and all Russia, and formally installed in his office in a ceremony at the Bogoyavlensky cathedral in Moscow on Sept. 12. At the end of the same month a visit was paid by the archbishop of York to Moscow as a gesture of friendship between the Church of England and the Russian church, and to lay the basis of regular communication. (M. Do.)

Education.—Elementary and secondary school children in the educational year 1941–42 were estimated to reach a total of approximately 36,200,000 (an increase of 3.4% over the 1940–41 total); the number of university students was estimated at 657,000 for 1941–42 (an increase of 13%); libraries (1940), 75,000 with 160,000,000 books; newspapers, 9,000 (in 70 languages), with a circulation of 38,000,000; printed books, 700,000,000 copies. Theatres, 790; cinemas, 30,461 in towns and 18,991 in villages.

Finance, Banking, Trade.—Estimates for 1940: Capital investments in industry, agriculture and transport from the all-union budget and other sources, 36.1 milliard roubles (15% increase over 1939). State revenue, 182,600,000,000 roubles (17.1% increase over 1939); state expenditure, 179,700,000,000 roubles (including defense services, 57,066,200,000; national economy 57,117,500,000; cultural services, 42,875,400,000, of which education, 23,195,000,000). Banks: 37,120 branch banks and agencies; deposits in savings banks, *c.* 7,000,000,000 roubles. Subscription to third five-year plan loan, 9,310,800,000 roubles. Gross retail trade turnover in 1939, 163,456,000,000 roubles. Foreign trade figures were not available for 1939, 1940, 1941 and 1942. Merchant marine (vessels of 100 tons and over) (1939) 1,316,000 gross tons.

Agriculture, Manufacturing, Mineral Production.—(Metric tons) Grain crops (1938): wheat 40,880,000; rye 20,930,000; oats 16,990,000; barley 8,200,000; maize 2,690,000; rice 317,000; potatoes (1938) 41,960,000; beet sugar (1940) 2,145,800; tea (1940) 12,900; cotton (1940) 800,000; cotton seed (1940) 1,720,000; wool (1938) 137,400; flax (1939) 633,000; hemp (1939) 110,000; raw silk (1940) 1,700; rayon (1940) 7,700; wood pulp (1938) 10,800,000; crude petroleum (1940) 29,700,000; natural gas (1938) 2,600,000,000 cu.ft.; coal (1940) 146,800,000; iron ore (metal content) (1940) 14,000,000; pig iron and ferro-alloys (1940) 14,950,000; steel ingots and castings (1940) 19,100,000; manganese ore (metal content) (1940) 1,300,000; bauxite (1938)

250,000; aluminum (1940) 55,000; chrome ore (1940) 96,000; silver (1938) 218,000; gold (1937) *c.* 150,000 kilograms.

Industry and Labour.—While the total population of the U.S.S.R. increased by 16% between 1926 and 1939, skilled workers and intellectuals increased by the following number of times: mechanics 3.7, turners 6.8, millwrights 13.0, locomotive drivers 4.4, plasterers 7.0, tractor drivers 215.0, engineers 7.7, agronomists 5.0, scientists 7.1, teachers 3.5, physicians 2.3.

The social composition according to the 1939 census returns was: workers and employees 49.7%; peasants on collective farms and handicraftsmen in producers' co-operatives, 46.9%; independent peasants and handicraftsmen, 2.6%; nonworkers, 0.04%; groups not shown, 0.7%.

Unitarian Church.

The general conference in Nov. 1943, nominated Senator Harold H. Burton of Ohio, one of the authors of the Ball-Burton-Hatch-Hill resolution, for moderator of the denomination, to take office in May 1944.

Decentralization in the administration of denominational affairs progressed, with the result that seven regional organizations, which included 97% of all Unitarian churches, were set up. A New England Unitarian council was established in 1943.

The organized young people of the churches adopted the name, "American Unitarian Youth." The first national meeting, outside of Massachusetts, was held in the summer of 1943 at Lake Geneva, Wis. Five of the younger clergymen visited the college campuses throughout the country during the winter (1943–44), where "Unity Groups" were in process of formation. During the summer four farm camps for high-school boys and girls, and two industrial camps for college women, were carried on "to train young people in leadership, aid them in solving problems in group living, and offer opportunity for constructive community service."

The Unitarian Service committee had stations in 12 countries, on 5 continents. It opened a temporary office in the Dominican Republic, to assist the Spanish refugees there to establish themselves elsewhere. In Ecuador, an office was to receive, settle and care for refugees from Europe and Africa with the co-operation of the government of Ecuador. The staff in Geneva, Switzerland, was increased because of the thousands of refugees who came over the border during the year. In co-operation with the British Unitarians, six centres for rest and recreation for Allied soldiers, called Hibbert Houses, functioned in 1943: two in Cairo, two in Alexandria, one in Palestine and one in Syria.

Through the War Service council, more than 2,000,000 copies of the pamphlet for service men, "Think on These Things," were distributed, and the Salvation Army voted to make this pamphlet its contribution to the U.S.O. reading kit for soldiers. The first pamphlet for women in the services was circulated, under the title, "Your Chaplain Welcomes You."

On the home front, a Japanese Relocation committee was set up to help solve the many problems confronting loyal Americans of Japanese descent.

The attitude of the Unitarian Church toward its members who were conscientious objectors is worthy of note. Dr. Frederick M. Eliot, president of the American Unitarian association, said, "The majority among us have special obligation to respect the minority, who with equal fortitude and courage, follow the line of duty which their consciences dictate." (*See* also CHURCH MEMBERSHIP.) (J. H. L.)

United Church of Canada.

The United Church of Canada, which in 1925 united the Presbyterian Church in Canada, the Methodist Church (Canada) and the Congregational Churches of Canada, reported for 1942 a membership of 721,184 with 1,713,186 persons under pastoral oversight, a Sunday School enrolment of 484,712 and 7,042 preaching places. The church owned property worth more than $85,567,035 and raised a total of $12,250,863 for all purposes.

The missionaries in West China were in a dangerous financial position owing to the inflation which prevailed and promised to grow worse. The missionary and maintenance givings of the church showed an increase of $57,879 over those of the year 1941.

The effort to liquidate a deficit of $1,700,000, which accumulated during the depression years, was meeting with success.

Among the important features in the life of the United Church during the year were the carrying on of a campaign of education to secure support for the pension fund by a system of assessments upon pastoral charges; the steady work of "The Commission on the Church, Nation and World Order" which will report to the next general council; the decision to join the Canadian Council of Churches in process of formation; the setting up of a commission to confer with the commission on re-union appointed by the Church of England in Canada; and the creation of a commission to study the possibility of a more extensive use of the radio as a part of the church's ministry.

About 200 ministers were in 1943 serving as chaplains in the Canadian armed forces. About 25 ministers were serving in the auxiliary services of the Canadian Legion and the Y.M.C.A.; 30 were listed as combatants, making a total of 255. This created a serious shortage of ministers for the normal work of the church. (G. A. SI.)

Ethiopia, Mexico and the Philippines adhered subsequently in 1942; Bolivia, Brazil, Iran, Iraq and Colombia signified their adherence in 1943.

United Nations Information Board.

This board, with headquarters in New York city, was one of the first United Nations organizations, established in Nov. 1942. It grew out of an organization called the Inter-Allied Information committee, created in Sept. 1940. The original purpose of this committee was to gather together in the United States representatives of the information services of the various Allies and co-ordinate their work.

The committee was financed and controlled during 1941 by Great Britain, her sister dominions, and the European allies. After the entry of the United States into the conflict and the merging of the Pacific and European wars, first China and then the United States took their places in the organization.

Following the development of the concept of the United Nations, in Nov. 1942, the title United Nations Information board was adopted, and all United Nations not yet members were

invited to join; by Dec. 1943, 19 such nations were associated with the agency.

Parallel with these developments in the U.S., a similar international agency grew up in Britain—first as the Inter-Allied Information committee and later as the United Nations Information organization. (W. B. M.)

United Nations Relief and Rehabilitation Administration.

The United Nations Relief and Rehabilitation administration came into being on Nov. 9, 1943, when representatives of 44 nations united and associated in World War II signed an agreement at the White House in Washington, D.C. In the preamble of that agreement they stated their determination that "immediately upon the liberation of any area by the armed forces of the United Nations or as a consequence of retreat of the enemy the population thereof shall receive aid and relief from their sufferings, food, clothing and shelter, aid in the prevention of pestilence and in the recovery of the health of the people, and that preparation and arrangements shall be made for the return of prisoners and exiles to their homes and for assistance in the resumption of urgently needed agricultural and industrial production and the restoration of essential services." UNRRA was created with a view to giving effect to this determination.

Having signed the agreement, the delegates gathered in Atlantic City, N.J., for the first council session of the administration, and throughout the remainder of the month laboured to turn their general purpose into a definite plan. As one of its first acts the council appointed Herbert H. Lehman, former governor of New York and head of the Office of Foreign Relief and Rehabilitation Operations since its inception, director general of UNRRA.

The conference further reached agreement upon a practicable program of defined scope, formulated a plan for financing the program, and devised a procedure for ascertaining and meeting needs. Principal among the policies established was that of nondiscrimination. Relief and rehabilitation was to be distributed fairly on the basis of the relative needs of the population in an area, and without discrimination because of race, creed or political belief.

The resolutions and reports adopted by the council constituted a guide for the director general. The work of the administration was to be further facilitated by appointment of its permanent committees: the committees on supplies and on financial control, the committees of the council for Europe and for the far east, and the committees on agriculture, displaced persons, industrial rehabilitation, and welfare. Administration headquarters were established in Washington, where an administrative staff of international experts was being brought together at the end of 1943. (*See* also POSTWAR PLANNING.) (H. H. L.)

United Service Organizations.

The United Service Organizations, Inc., (U.S.O.) was formed Feb. 4, 1941, by the following member agencies: Young Men's Christian associations, National Catholic Community service, Salvation Army, Young Women's Christian associations, Jewish Welfare board and National Travelers Aid association. Its purpose was to provide off-duty recreational, spiritual and welfare services to the armed forces, and to workers in overburdened war production centres, as requested by the government.

In 1941 and 1942 U.S.O., supported entirely by public subscription, obtained $14,353,666 and $32,586,501 respectively through its own campaigns. In 1943, with 16 other major war-related agencies, it was a member of the National War fund, which set a goal of $125,000,000. U.S.O.'s quota of that amount was $61,227,000.

On Dec. 20, 1943, there were 2,779 U.S.O. clubs and other services including both agency and community conducted operations. Of these, 1,790 were operated by the U.S.O. member agencies and 989 by local communities in affiliation with U.S.O. These services fell into the following principal classifications:

Clubs in continental United States, including those conducted by member agencies and local communities in affiliation with U.S.O., numbering 1,716 and located in 48 states and the District of Columbia. Standard equipment included lounges, writing rooms, showers, snack bars, game rooms, libraries, musical instruments and auditoriums. Giving limited U.S.O. services were 514 smaller centres.

Troops-in-Transit Service operated 125 lounges in rail and bus terminals, supplemented by 152 U.S.O.-Travelers Aid services.

Mobile Service units numbered 130. They served men on outpost duty along Atlantic and Pacific coasts, as well as troops on manoeuvres.

Overseas Division maintained 126 clubs, 16 smaller centres, and 24 mobile units in western hemisphere bases from Alaska and Newfoundland to Brazil and also in Hawaii.

U.S.O.-Camp Shows, an affiliate, had 85 units touring army camps and navy posts in continental United States and 35 in western hemisphere bases and combat zones.

Attendance at clubs and lounges was approximately 28,000,000 a month. U.S.O.-Camp Shows performed before an average monthly audience of 2,000,000.

Information and counsel on personal problems constituted an important part of U.S.O. services in 1943. Opportunities were provided for service men and women to continue customary church attendance and association with churchmen and church members. Religious counsel, as requested, was also available. Special programs were held for the wives of service men, such as social gatherings and classes in pre-natal and child care, sewing, nutrition and cooking.

The work of 800,000 volunteers in 1943 was indispensable at clubs and lounges, not only in assisting professional staffs but also in providing companionship to men and women in service at programs and social events.

In addition to serving men and women in the armed forces, U.S.O. extended services to war workers and their families in certain overcrowded war production centres. Programs were patterned after those for the armed forces, with emphasis on classes for women similar to those for the wives of service men.

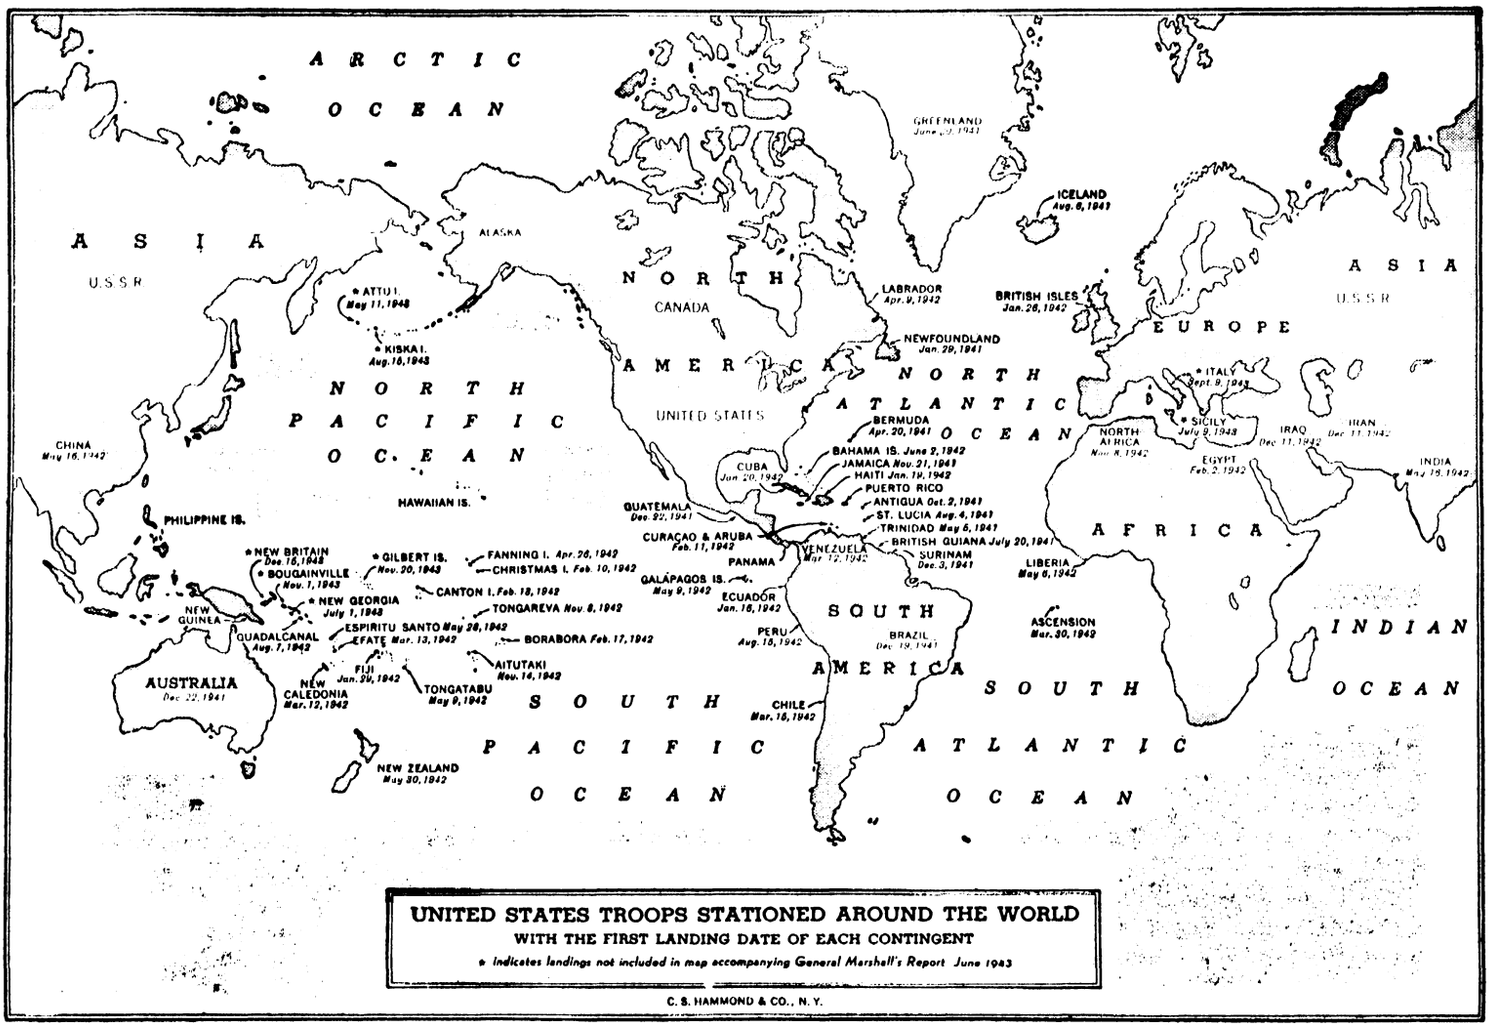
U.S.O. officers in 1943 were: Chester I. Barnard, president; John D. Rockefeller, Jr., honorary chairman; Walter Hoving, chairman of the board; W. Spencer Robertson, chairman of the executive committee; Francis P. Matthews, Frank L. Weil and Mrs. Henry A. Ingraham, vice-presidents; Randall J. LeBoeuf, Jr., secretary; and John F. Hickey, treasurer. National headquarters were in the Empire State building, 350 Fifth ave., New York 1, N.Y. (C. I. B.)

United States.

The population of the United States in 1940, by the federal census, was 131,669,275. This figure represented an increase of 8,894,229 over the census of 1930. With possessions included, the population was 150,621,231 in 1940. On Jan. 1, 1943, the census bureau estimated the population of the U.S. proper at 135,645,969. The area of continental U.S.A. is 3,022,387 sq.mi. For population figures of the states, *see* the articles on the separate states. *See* also BIRTH STATISTICS; CENSUS, 1940; CHURCH MEMBERSHIP; DEATH STATISTICS; INDIANS, AMERICAN; NEGROES (AMERICAN).

Politics and Parties.—The most significant trend in U.S. domestic politics during 1943 was the ebb of the power of the

New Deal. This was evidenced not only by the substantial Republican gains made in the November elections of 1943, but also in the attitude of many prominent Democrats who became increasingly critical of "government by directive" and advocated a larger measure of congressional independence, initiative and control over the various administrative agencies of the New Deal. In September a conference of prominent Republican leaders met at Mackinac Island, Michigan, to plan the party's strategy for the presidential contest of 1944. In full confidence in a coming Republican victory, the conference pledged the party to a vigorous prosecution of the war and to the participation of the United States in postwar co-operation with the other members of the United Nations to prevent military aggression. The next month Wendell Willkie, the Republican standard bearer of 1940, in an address at the Kiel auditorium in St. Louis, declared that the freeing of enterprise for expanding productivity could be accomplished only by a change of government at Washington. The election of a Republican governor in Kentucky in 1943, for the first time in 16 years, increased the confidence of the party that it would carry the presidential election of 1944.



Congress.—The first session of the 78th congress convened on Jan. 6, 1943, and, except for a vacation from June 8 to Sept. 14, sat until Dec. 21. It contained 222 Democrats to 209 Republicans in the house and 57 Democrats to 38 Republicans in the senate, as against 267 to 162 and 66 to 28 respectively in the 77th congress. The close of the year saw the Democratic majority reduced by deaths and by-elections to the barest margin. At the same time, the November elections showed that after Jan. 1, 1944, there would be Republican governors in 26 of the 48 states —states which include 60% of the population and 342 of the 531 electoral votes, and had cast 37,700,000 of the 49,500,000 popular votes in the presidential election of 1940. The president's message to congress in Jan. 1943, dealt chiefly with the war effort, citing the astonishing figures of production in the war industries, and commenting: "I suspect that Hitler and Tojo will find it difficult to explain to the German and Japanese people just why it is that decadent, inefficient democracies can produce such phenomenal quantities of weapons and munitions and fighting men." The major measures which occupied the attention of congress during 1943 were, on the domestic front, the renewal of lend-lease which was due to expire on June 30; legislation to end the menace of strikes, especially in the coal fields; the control of the threatening spectre of inflation; and the elaboration of a tax bill to include the pay-as-you-go principle, drain off considerable amounts of excess money ("dangerous dollars," as Secretary Morgenthau called it) in the hands of the spending public, and provide, both by raising the rates and lowering the exemptions, for the addition of thousands of millions of dollars to the treasury. Congress also wrestled with the question of the continued government subsidies to farmers under the program of the Commodity Credit corporation; the drafting of pre-Pearl Harbor fathers (those men who became fathers before Sept. 1, 1942); and the liquidation (July 1) of the WPA, which since 1935 had spent over $10,000,000,000. On the war front congress showed every disposition to support the president, regardless of party affiliation. The vote on the renewal of lend-lease (March 11) until June 30, 1944, was 82 to 0 in the senate and 407 to 6 in the house, as against 60 to 31 and 260 to 165 on the original bill of 1941. It was revealed that a total of $9,632,000,000 had been allotted under the lend-lease program up to March 1, 1943, including $4,430,000,000 to the United Kingdom, $1,825,000,000 to the U.S.S.R., but only $157,000,000 to hard-pressed China. The administrator, Edward R. Stettinius (in August to succeed Sumner Welles as undersecretary of state) estimated that about one-third of U.S. production in planes and tanks was going to lend-lease. Some excitement was caused when William H. Standley, U.S. ambassador to the U.S.S.R., publicly charged the soviet government with minimizing the aid which the United States was giving to Russia; but Stalin's handsome acknowledgment at the Tehran conference of Roosevelt, Churchill and Stalin at the end of November that without the aid of the United States the war could not be won fully atoned for any misgivings as to the appreciation of the help given to the soviet government.

"WE ALWAYS SUSPECTED," by Manning in the (Phoenix) *Arizona Republic*. Uno Who is the cartoonist's ordinary U.S. citizen

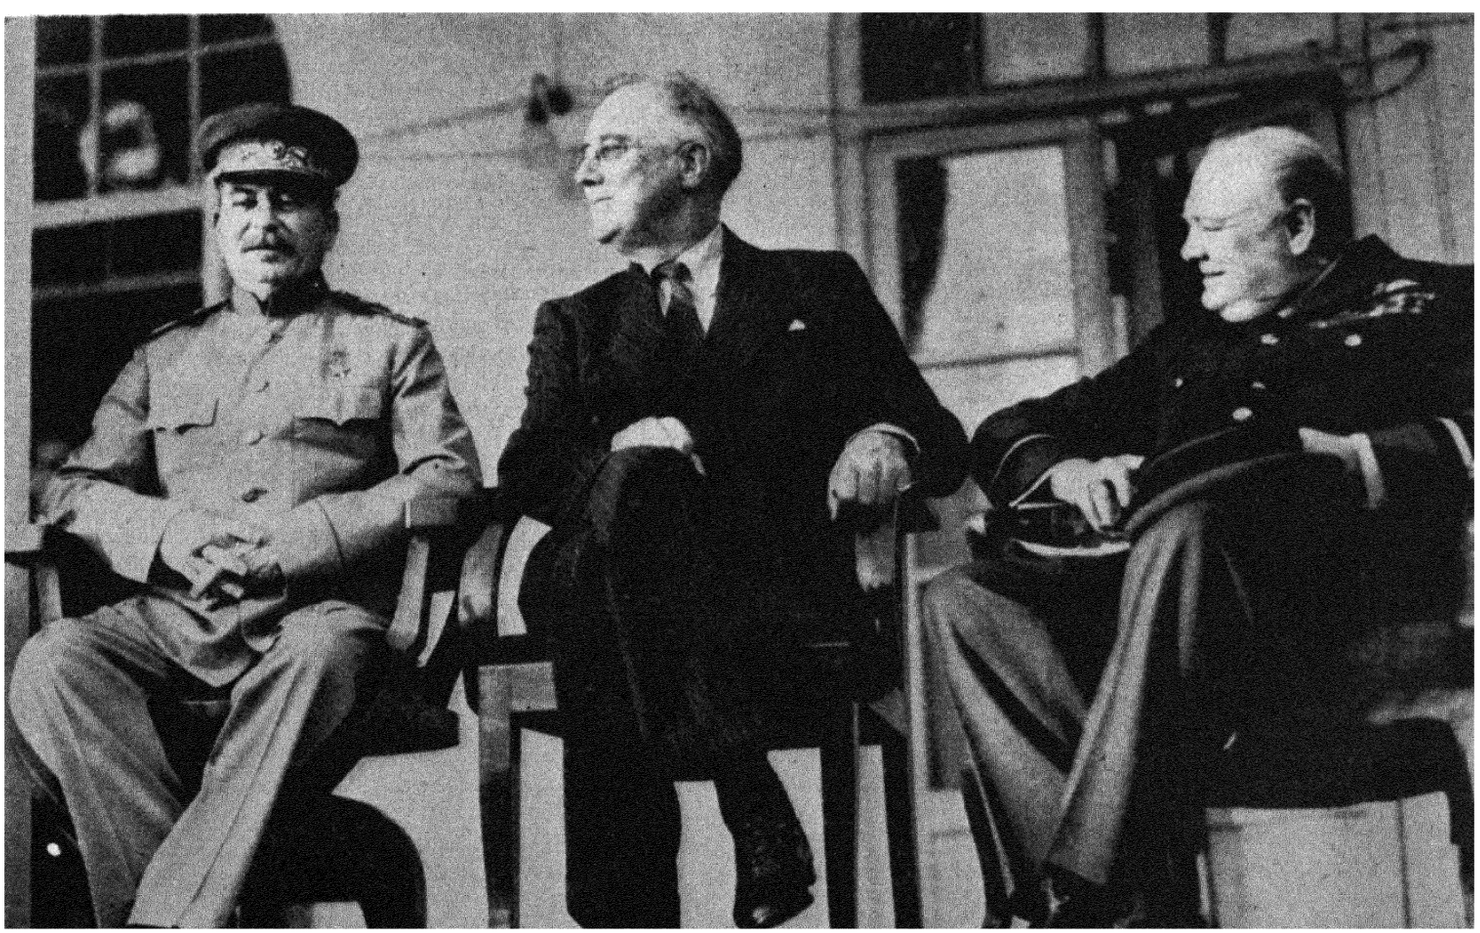
In response to the stiffening public opinion in condemnation of the series of strikes staged by John L. Lewis' United Mine Workers (see *Labour*, below), congress on June 25 passed the Connally-Smith bill, which aimed at putting an end to strikes in industries vital to the prosecution of the war. The bill did not completely outlaw strikes, but provided that no strike ballot should be taken until 30 days after certifying the dispute to the secretary of labor, the War Labor board and the National Labor Relations board. Though the president agreed to seven of the sections of this War Labor Disputes act and was ready to have the Selective Service act so amended as to compel strikers in war plants to resume work under military compulsion, he vetoed the bill both on the ground that it prohibited campaign contributions from labour unions and made provision for a strike ballot, whereas labour had given a pledge after Pearl Harbor not to strike during the war. The president maintained that the pledge had been kept by all the unions except the United Mine Workers and that only one-twentieth of 1% of man hours had been lost by strikes since Pearl Harbor—a record which "had never before been equalled in our country and was as good or better than the record of any of our Allies in war time." Nevertheless, congress, by votes of 244 to 108 in the house and 56 to 25 in the senate immediately passed the bill over his veto. It was the first time since June 1940, that congress had overridden the presidential veto, and was regarded as a significant proof of congressional independence.

The task of preventing runaway inflation by a rapid rise in prices and a corresponding demand for higher wages in industry

MAP based on Gen. George C. Marshall's report of the progress of the United States' participation in World War II through June 1943. Subsequent landings through Dec. 1943 are starred

fell largely to the administrative agencies of the Office of Price Administration (headed by ex-Senator Prentiss Brown and later by Chester Bowles) and the War Labor board (chairman, William H. Davis). But that part of the task of "holding the line" against inflation which depended on the tax program of course fell to the province of congress, which alone has the power of raising revenue. Congress debated the tax program during all of 1943, with eyes fixed partly on the needs of the treasury, partly on the fight against inflation, and partly on the elections of 1944. We shall note later some details of the program (see *Taxes,* below); but here it is enough to state that, while congress had reached agreement on the method of taxation, it had not fully determined the rates by the end of 1943. The method sought to combine the pay-as-you-go plan (a modification of the project proposed originally by Beardsley Ruml) with the arrears of the taxes on incomes of 1942.

The question of the continuance of farm subsidies, some 40 of which were administered by the Commodity Credit corporation, was still unsettled as 1943 came to an end, the senate postponing action on it in order to get on with the tax bill. In spite of an impassioned radio plea for subsidies by the "economic czar," James F. Byrnes, and the support of the director of economic stabilization, Fred M. Vinson, the house of representatives, in the first week in December defeated subsidies by the large majority of 278 votes to 117. They had already approved the extension of the CCC to July 1, 1945, but cut out food subsidies after Dec. 31, 1943. The opposition to subsidies came largely from the farm bloc, which one might expect to approve the government's payment for the added costs of farm production. But the farmers objected to the stabilization of price ceilings on their crops, fearing that when the war was over the subsidies would cease, leaving the public conditioned to the lower farm prices. They preferred to let prices rise, despite Byrnes' declaration that the cost to the taxpayers of something over $1,000,000,000 a year would be far less than the cost in inflationary prices of food products. But the farm bloc, remembering the slump of 1920 in farm prices, was deaf to his plea. Senator Taft of Ohio proposed a compromise measure of $600,000,000 for farm subsidies, but it was ignored by congress. (*See* also ELECTIONS.)



The Budget and Finance.—In his budget message of Jan. 1943, President Roosevelt asked for something over $100,000,000,000, of which $97,000,000,000 was to be for war expenditures for the fiscal year 1943–44. He also asked for an increase of $16,000,000,000 in taxes. The war cost, he said, had increased fourfold since Pearl Harbor, from about $2,000,000,000 to $8,000,000,000 a month. The debt limit was raised from $125,000,000,000 to $210,000,000,000, and a rider by Representative Wesley Disney (Dem., Okla.) was attached revoking the executive order of the president limiting incomes to $25,000 after taxes were paid. On Nov. 27 the budget director, Harold D. Smith, announced a cut of $11,000,000,000 in the 1944 budget, bringing it down to $92,000,000,000, and estimated the deficit at the end of 1943 at $57,000,000,000 and the public debt at $194,000,000,000. Purchases of war bonds and stamps for 1942 amounted to but $9,000,000,000, or less than 8% of the national income of $116,000,000,000. The war loan drives of Dec. 1942 ($12,000,000,000), April 1943 ($13,000,000,000) and Sept.-Oct. 1943 ($15,000,000,000), each of them double or more the great third Liberty Loan drive of

1918, were readily subscribed; and a fourth drive was announced for Jan. 1944. (*See* WAR BONDS.) It was evident that the enormous expense of the war, which by the end of 1943 was taking some two-thirds of the national income, would have to be met largely by borrowing, though it was hoped that the higher tax rates and the addition of more than 20,000,000 new taxpayers in 1943 would bring into the treasury close to $50,000,000,000, or approximately one-third of the national income, as against less than one-fourth in 1942. It was pointed out that in Britain 43% and in Canada 52% of the national income was paid in taxes. U.S. war expenses at a rate of almost $100,000,000,000 a year at the end of 1943 exceeded those of Germany, Great Britain, the U.S.S.R., Italy and Japan combined. (*See* also NATIONAL DEBT.)

Taxes.—In his budget message of 1943, as noted above, the president asked for $16,000,000,000 in new taxes. This figure was later pared down to $12,000,000,000, and again to $10,500,000,000, which was Secretary Morgenthau's irreducible minimum demand. After debating the subject for months, the house in the late autumn passed a bill calling for only a $2,139,000,000 increase over the tax assessment of 1942 (which, incidentally, had raised taxes by $9,000,000,000). The senate had not reached its final decision before the end of 1943. The reasons for this meagre response to the requests of the president and the secretary of the treasury were various. Some congressmen believed that the wealthier taxpayers could not bear the proposed increases in the higher brackets without serious detriment to business enterprise. Others held that since four-fifths of the national income went to persons with $5,000 a year or less, a 3% tax on low incomes should be levied. Still others advocated a federal sales tax, which added to the sales tax levied in several of the states, would increase the burden on the poor. All of the congressmen doubtless had an eye fixed on the approaching elections of 1944, and were affected by the perennial reluctance of congress to increase taxes on the eve of a presidential year. Randolph Paul, the expert adviser of the treasury department, was chiefly concerned with the threat of inflation in an inadequate tax assessment. He pointed out that while incomes had mounted by some $80,000,000,000 since Pearl Harbor, personal taxes had increased by only $19,000,000,000. Though the American people had paid off $4,000,000,000 of debts since Dec. 1941, had accumulated $10,000,000,000 in social security and insurance funds, had bought $20,000,000,000 more of government bonds, they still had over $18,000,000,000 more in bank deposits and currency than they had at the time of Pearl Harbor. This vast amount of spendable money was serving to widen the "inflationary gap," that is, the discrepancy between the dwindling amount of civilian goods purchasable and the cash in hand for buying. The administration still held to the increased tax program as the best check on inflation, but the refusal of congress to levy more than about one-fifth of the added taxes asked by the treasury department left to administrative agencies (the OPA and the OES) the task of keeping down prices as best they could through ceilings. (*See* also PRICES; TAXATION.)

Industry.—When President Roosevelt in his Jan. 1943, message to congress declared that "the arsenal of democracy is making good," he spoke no idle words. By the close of the year the goals set for 184,000 manufacturing plants were more than reached. The national production figures had risen from $54,000,000,000 in 1940 to $119,000,000,000 in 1942, and $151,000,000,000 in 1943. U.S. war production equalled that of all the enemy countries combined. Since the beginning of the war the United States had increased petroleum output by 66%, coal by 40%, chemicals by 300%, iron ore by 125%, hydroelectric power by 79%, and steel by 106%. In order to develop still further a unified program for the maximum use of the nation's industrial resources for both military and civilian needs, the president in May

MARSHAL STALIN, PRESIDENT ROOSEVELT AND PRIME MINISTER CHURCHILL at the Tehran conference, Nov. 28–Dec. 1, 1943

created the Office of War Mobilization with James F. Byrnes as head and secretaries Stimson and Knox, Donald M. Nelson, Fred M. Vinson and Harry Hopkins as members. This was essentially an economic war cabinet, vested with a control over the nation's industries not unlike that of Bernard Baruch's War Industries board of 1917. Byrnes was made a sort of czar over all the special directors of industrial production: Jeffers (rubber), Ickes (fuel), Eastman (transportation), Bowles (OPA), McNutt (manpower), Nelson (WPB), Wickard (agriculture), William H. Davis (WLB), and Elmer Davis (OWI). Monthly production of planes rose from 2,500 at the beginning of 1942 to nearly 9,000 at the end of 1943; tonnage of merchant ships from 7,000,000 to 27,000,000, and of naval vessels from 213,854 to 1,091,368. (*See* also BUSINESS REVIEW; WAR PRODUCTION, U.S.)

Labour.—During almost the entire year 1943 the administration, congress and the public were kept in a state of indignant unrest by the defiant attitude of John L. Lewis, president of the United Mine Workers of America. Three times Lewis called out the miners on strike, causing the eventual loss of 40,000,000 tons of coal, with serious consequences for the war industries and transportation. The miners' contract with the operators expired on April 1, and the union demanded an increase of $2 a day in wages to meet the increased cost of living. Lewis flouted the "little steel formula" of July 1942, which had limited wage increases to 15% above the level of Jan. 1941, and refused to recognize the authority of the War Labor board, which he called "a jealous and vindictive body." The "surrender" to Lewis was widely condemned in the country. By his successful defiance he had put the WLB in an embarrassing position and given encouragement to other unions to break the non-strike pledge following Pearl Harbor. The president, who had constantly been charged with too great leniency toward organized labour, did not refrain from expressing his disapproval of the tactics of the miners' union, nor did James F. Byrnes, in a nation-wide radio address on the anniversary of Pearl Harbor (Dec. 7).

Near the end of 1943 another major conflict loomed in the labour field. The 350,000 operating and 1,100,000 non-operating railroad employees had been for some months seeking a raise of 30% in wages to compensate for the higher cost of living. Utterly dissatisfied with the increase of 4 cents an hour offered them by the emergency board of the Railway Labor act, the five railway brotherhoods (engineers, firemen, conductors, trainmen and switchmen) took a strike ballot in the second week of December, in which 97.7% of their members voted to quit work on all the lines of the country. The seriousness of such a threat at the time when the roads were at the peak of their job could not be exaggerated. President Roosevelt moved immediately to meet the situation by summoning to a conference at the White House on Dec. 19 the heads of the five railroad brotherhoods and the wage committees of the carriers who had the power to make wage agreements with the unions. The seriousness of the situation was enhanced by the fact that no help could be expected from congress, since the legislators voted to adjourn from Dec. 21 to Jan. 10. The upshot of several conferences among the representatives of the brotherhoods and the carriers, the president and Economic Stabilization Director Vinson was that on Christmas Eve the strike was called off. At the same time a threatened strike of 350,000 workers in the steel industry was averted when Philip Murray, president of the C.I.O., announced that the men would continue work. (*See* also LABOUR UNIONS; STRIKES AND LOCKOUTS.)

The Food Problem.—The U.S. farm still remained the "biggest war plant" in 1943. The whole world had come to depend on it for food supplies for the various fighting forces. The president in his budget message of Jan. 1943, asked for $991,996,154 for agriculture in the fiscal year 1943, partly for soil conservation and partly for parity payments. Though U.S. farm production for 1943 exceeded that for 1942 by about 5%, he warned that the military forces and lend-lease would require close to 50% more, and predicted a stricter rationing of food supplies for civilians, which "might hurt our taste but not our health." For there would still be an ample supply of dairy products (except butter), meat, poultry, and fresh fruits and vegetables. Food Administrator Wickard announced in Feb. 1943 the extension of rationing to canned soups, fruits and vegetables, dried fruit, margarine, butter, meat and oils. The farmer's income was steadily rising (an increase of 90% since 1941), but there were three serious difficulties with which he had to cope. First, there were the perennial uncertainties of weather. In the spring, continuous excessive rains threatened to make serious inroads on the corn and grain crops; but warm sunny weather following dispelled the fear, and the actual returns exceeded those of 1942. However, the shortage in manpower to work the farms and in agricultural machinery created unprecedented difficulties. The importation of workers from Mexico, the utilization of prisoners of war and of some trainees released by the selective service, and the employment of school children in vacation time helped the situation; but these sources furnished only a small addition to the agricultural forces. Furthermore, the government was steadily cutting down the allotment of material for the building of new agricultural machines and the repair of those in use. Farmers were obliged to operate often with worn-out seeders, tractors, binders and reapers, patched up with scrap and tied with twine. It was not inadequate prices from which they were suffering, as in the years following World War I. Their income was higher than ever before. But money could not buy the help or the material they needed. (*See* also AGRICULTURE.)

"FIVE MINUTES IN A FOXHOLE Would Be Enough!" Cartoon by Temple of the *Times-Picayune* of New Orleans in 1943

Manpower.—The agricultural situation was but one aspect of the general problem of manpower with which McNutt, Hershey

and Byrnes were wrestling. The goal set for 1943 was the augmentation of the 6,000,000 in the armed forces at the beginning of the year by some 4,500,000, and the increase of about 7,000,000 workers in munitions and essential war industries. The 8,000,000 unemployed employables at the time of Pearl Harbor had practically all been absorbed by the war demands, and the problem became one of better budgeting of the available man- and womanpower. Some critics of the selective service insisted that the educational and physical requirements for induction into the army and navy could be lowered somewhat without prejudice to the morale of the troops. After congress reassembled in Sept. 1943, the main debate on the subject of manpower was on the necessity of calling up the pre-Pearl Harbor fathers. Late in November the congress voted for conscription of the pre-Pearl Harbor fathers, but put them at the bottom of the list; and the president agreed to the bill. A distinctive feature of 1943 was the great increase in the number of women workers, both in the ranks of the uniformed women (the WACS, WAVES, SPARS, and the marine and ferry corps) and in the war industries. By the end of 1943, about one-third of the women between the ages of 18 and 64 were engaged in some kind of war work, and it was estimated that 18,000,000 more were available. Colonel Oveta Culp Hobby of the WACS, for example, declared that she could use ten times the 50,000 women already serving in her organization. Reports from some 8,000 manufacturing plants showed that the women workers had risen 184% in the aircraft industry, 161% in steel and 36% in iron. In World War I women had served as nurses and ambulance drivers and had replaced men as ticket collectors, trolley conductors, elevator operators and a number of other light occupations; but now they were doing men's jobs at almost all the factories, mills and shipyards in the United States.

Transportation.—*The Railroads.*—In spite of heavy handicaps, the railroads in 1943 surpassed even the "magnificent record" of the previous year. With 38% fewer locomotives and 25% fewer cars, they carried 80,000,000 passenger miles and 735,000,000 freight miles of traffic, as compared with the corresponding figures of 54,000,000 and 638,000,000 in 1942. They moved an average of 2,000,000 soldiers and sailors a month. The burden on the railroads was increased over that in World War I by the fact that they had now to devote more than 30% of their service to the ports of the Pacific coast, as against only 7% in the former war. However, two of the handicaps under which the roads were operating in 1942 were reduced during 1943. In the first place, the submarine menace waned; the significance of the victory over the submarines can be realized by the fact that before their raids began about 95% of the oil used in U.S. industries was brought from the wells of Texas, Oklahoma and California by water. The railroads rose to the occasion when the oil famine threatened, and increased their haulage from some 180,000 bbl. to 800,000 bbl. a day. Along with the relief in the U-boat menace came the completion in July 1943 of the "big inch," the 1,341-mi. oil pipeline from Texas to New Jersey, across eight states and under 20 rivers, with a capacity of delivering 350,000 bbl. a day. Considerable excitement was caused by a speech of Vice-President Wallace at Dallas, Tex., on Oct. 20, in which he warned against an attempted monopoly of transportation by the railroads at the expense of trucks and buses, and was answered with some heat by President John J. Pelley of Association of American Railroads. But the serious event in the railroad situation came in the last days of 1943, when the operating and non-operating railroad employees threatened to strike (*see* above). The upshot of the dispute was a presidential order to Secretary Stimson on Dec. 27 for the army to take over the railroads. Ere the year closed, as we have seen, the railroads called off the strike, agreeing to arbitration by the government which they were confident would satisfy their wage demands. (*See* also RAILROADS.)

Shipping.—To the 8,000,000 tons of merchant vessels built in 1942, the U.S. added 16,000,000 in 1943. By the end of Sept. 1943, more than 2,000 ships had been launched, and the goal for 1944 was 5,000 ships with a tonnage of 50,000,000—or more than half the total tonnage of the world in 1939. In Dec. 1943, the rate of building was 130% higher than in 1942, and was proceeding at an enormously increased figure over the sinkings, which at the beginning of the year had averaged six ships a day. (*See* also SHIPBUILDING; SHIPPING, MERCHANT MARINE.)

Aviation.—Production in the aircraft industry rose from $6,400,000,000 in 1942 to more than $20,000,000,000 in 1943, a figure equal to one-seventh of the U.S. national income. Though most of the planes were for the armed forces, about one-fourth were transport planes capable of conversion for civilian use. Work was under way in 1943 on the largest airfield in the world, on Long Island, N.Y.: a field five times as large as La Guardia field, with 13 mi. of runways and a capacity of 1,000 flights a day. The 21 domestic and international commercial airlines for the most part kept in operation during 1943; and although TWA, for example, saw its commercial fleet reduced by 57%, it lost only 23% of plane mileage. Workers in the aircraft plants increased from 390,000 men in 1941 to 1,200,000 men and women in 1943, when the entire plane output of the axis powers was exceeded. On the second anniversary of Pearl Harbor the 150,000th plane was completed. (*See* also AIR FORCES; WAR PRODUCTION, U.S.)

The Army and Navy.—During 1943 the demands of the chief of staff, General George C. Marshall, rose from an army of 7,500,000 to one of 10,700,000. Ten out of every 14 able-bodied men between the ages of 18 and 38, it was estimated by manpower commissioner McNutt, were in the armed forces at the close of 1943. The contest between the army, the navy, industry and agriculture for men was bound to be keen. Germany had put 13.5% of her population into the field, a proportion which would mean forces of 17,500,000 for the United States. The military appropriations for the year totalled $99,147,000,000 ($71,510,000,000 for the army and $27,637,000,000 for the navy). The army air forces at the end of the year contained 2,500,000 men, or more than all the U.S. armed forces in World War I; and the naval air force had grown from 1,744 planes to 18,269. Fighting ships

"THERE'S AN ODD FAMILY RESEMBLANCE AMONG THE DOCTORS" said Jim Berryman of the *Washington Evening Star*

numbered 2,674 at the close of 1943, as against 953 a year earlier and 674 in 1941. In those three years the United States built 2,200,000 tons of naval ships, added 23,000 planes, and completed $500,000,000 worth of shore facilities. (*See* also AIR FORCES; NAVIES OF THE WORLD; SELECTIVE SERVICE.)

International Affairs.—The text of U.S. policy in foreign relations might be found in President Roosevelt's Lincoln day (Feb. 12, 1943) speech at Washington: "Unless the peace that follows the war recognizes that the whole world is one neighbourhood and does justice to the whole human race, the germs of another world war will remain as a constant threat to mankind." To co-ordinate the efforts of the United Nations, especially the four great ones, the United States, Britain, U.S.S.R. and China, which contained three-fourths of the population of the world, was the constant concern of the president. In May 1943, he held his fifth conference with Prime Minister Winston Churchill since they had together written the Atlantic Charter of Aug. 1941. And in August they met again at Quebec, with Secretary Hull and Foreign Minister Eden attending. On Feb. 21 Madame Chiang Kai-shek addressed congress (the first private citizen ever to do so) and pleaded for the defeat of Japan without waiting until the Germans gave in. But in spite of the admiration of everyone for the courage with which China had withstood the assault of the far better equipped forces of Japan for more than six years, the strategy of the United Nations favoured concentrating the main attack on Hitler's far-flung forces. From Sept. 1 on hardly a week passed without some important conference bearing on the problems of winning the war and providing for the postwar world. Congress, which reconvened in the middle of September (soon after the conference of the Republican leaders at Mackinac Island) showed a far different attitude toward co-operation in a program to insure lasting peace than it had displayed after the armistice of World War I. A group of senators led by Burton, Ball, Hatch and Hill (the so-called B2H2 group) was urging the participation of the United States in a concert of the United Nations for a durable peace; and the house, by a vote of 360 to 29 on Sept. 26, adopted a resolution of Congressman James W. Fulbright of Arkansas, favouring U.S. participation in the creation of appropriate international machinery "with power adequate to establish and maintain a just and lasting peace among the nations of the world." A resolution of similar intent by Chairman Tom Connally (Dem., Tex.) of the foreign relations committee was before the senate. On Nov. 27 there met at Atlantic City the council of the United Nations' Relief and Rehabilitation Administration (ex-governor Herbert H. Lehman of New York, chairman) which laid plans for the expenditure of some $2,000,000,000 for the relief of destitution in the war-torn countries, each to contribute 1% of its national income for the preceding year. It was estimated that the United States would bear $1,350,000,000 of this expense, and that the needs of the 35 countries with 500,000,000 inhabitants would take some 46,000,000 tons of food and other supplies. (*See* also POSTWAR PLANNING.)

Meanwhile a series of historic conferences among the world leaders was taking place. At the end of October Secretary Hull flew to Moscow to meet foreign secretaries Eden of Great Britain and Molotov of the soviet union for discussions preliminary to the conference of the principals, Roosevelt, Churchill and Stalin, a few weeks later. (D. S. MU.)

The text of the joint four-nation* declaration signed Nov. 1, 1943, at Moscow was as follows:

The governments of the United States of America, the United Kingdom, the soviet union and China:

United in their determination, in accordance with the declaration by the United Nations of Jan. 1, 1942, and subsequent declarations, to continue hostilities against those axis powers with which they respectively are at war until such powers have laid down their arms on the basis of unconditional surrender;

Conscious of their responsibility to secure the liberation of themselves and the peoples allied with them from the menace of aggression;

Recognizing the necessity of ensuring a rapid and orderly transition from war to peace and of establishing and maintaining international peace and security with the least diversion of the world's human and economic resources for armaments;

Jointly declare:

1.—That their united action, pledged for the prosecution of the war against their respective enemies, will be continued for the organization and maintenance of peace and security.

2.—That those of them at war with a common enemy will act together in all matters relating to the surrender and disarmament of that enemy.

3.—That they will take all measures deemed by them to be necessary to provide against any violation of the terms imposed upon the enemy.

4.—That they recognize the necessity of establishing at the earliest practicable date a general international organization, based on the principle of the sovereign equality of all peace-loving states, and open to membership by all such states, large and small, for the maintenance of international peace and security.

5.—That for the purpose of maintaining international peace and security pending the re-establishment of law and order and the inauguration of a system of general security, they will consult with one another and as occasion requires with other members of the United Nations with a view to joint action on behalf of the community of nations.

6.—That after the termination of hostilities they will not employ their military forces within the territories of other states except for the purposes envisaged in this declaration and after joint consultation.

7.—That they will confer and co-operate with one another and with other members of the United Nations to bring about a practicable general agreement with respect to the regulation of armaments in the postwar period.

The declaration of the Moscow conference regarding Italy was as follows:

The foreign secretaries of the United States, the United Kingdom and the soviet union have established that their three governments are in complete agreement that Allied policy toward Italy must be based upon the fundamental principle that fascism and all its evil influence and configuration shall be completely destroyed and that the Italian people shall be given every opportunity to establish governmental and other institutions based upon democratic principles.

The foreign secretaries of the United States and United Kingdom declare that the action of their governments from the inception of the invasion of Italian territory, in so far as paramount military requirements have permitted, has been based upon this policy.

In furtherance of this policy in the future the foreign secretaries of the three governments are agreed that the following measures are important and should be put into effect:

1.—It is essential that the Italian government should be made more democratic by inclusion of representatives of those sections of the Italian people who have always opposed fascism.

2.—Freedom of speech, of religious worship, of political belief, of press and of public meeting shall be restored in full measure to the Italian people, who shall also be entitled to form anti-fascist political groups.

3.—All institutions and organizations created by the fascist regime shall be suppressed.

4.—All fascist or pro-fascist elements shall be removed from the administration and from institutions and organizations of a public character.

5.—All political prisoners of the fascist regime shall be released and accorded full amnesty.

6.—Democratic organs of local government shall be created.

7.—Fascist chiefs and army generals known or suspected to be war criminals shall be arrested and handed over to justice.

In making this declaration the three foreign secretaries recognize that so long as active military operations continue in Italy the time at which it is possible to give full effect to the principles stated above will be determined by the commander in chief on the basis of instructions received through the combined chiefs of staff.

The three governments, parties to this declaration, will, at the request of any one of them, consult on this matter. It is further understood that nothing in this resolution is to operate against the right of the Italian people ultimately to choose their own form of government.

Following is the text of the declaration on Austria signed at Moscow:

The governments of the United Kingdom, the soviet union and the United States of America are agreed that Austria, the first free country to fall a victim to Hitlerite aggression, shall be liberated from German domination.

They regard the annexation imposed on Austria by Germany on March 15, 1938, as null and void. They consider themselves as in no way bound by any changes effected in Austria since that date. They declare that they wish to see re-established a free and independent Austria and thereby to open the way for the Austrian people themselves, as well as those neighbouring states which will be faced with similar problems, to find that political and economic security which is the only basis for lasting peace.

Austria is reminded, however, that she has a responsibility, which she cannot evade, for participation in the war at the side of Hitlerite Germany, and that in the final settlement account will inevitably be taken of her own contribution to her liberation.

*This was the only declaration of the Moscow Conference to which China was a signatory.

The following statement on atrocities, released concurrently with the other Moscow declarations, was signed by President Roosevelt, Prime Minister Churchill and Premier Stalin:

The United Kingdom, the United States and the soviet union have received from many quarters evidence of atrocities, massacres and cold-blooded mass executions which are being perpetrated by Hitlerite forces in many of the countries they have overrun and from which they are now being steadily expelled. The brutalities of nazi domination are no new thing, and all peoples or territories in their grip have suffered from the worst form of government by terror. What is new is that many of these territories are now being redeemed by the advancing armies of the liberating powers and that in their desperation the recoiling Hitlerites and Huns are redoubling their ruthless cruelties. This is now evidenced with particular clearness by monstrous crimes on the territory of the soviet union which is being liberated from Hitlerites and on French and Italian territory.

Accordingly, the aforesaid three Allied powers, speaking in the interests of the 32 United Nations, hereby solemnly declare and give full warning of their declaration as follows:

At the time of granting of any armistice to any government which may be set up in Germany, those German officers and men and members of the nazi party who have been responsible for or have taken a consenting part in the above atrocities, massacres and executions will be sent back to the countries in which their abominable deeds were done in order that they may be judged and punished according to the laws of these liberated countries and of the free governments which will be erected therein. Lists will be compiled in all possible detail from all these countries, having regard especially to invaded parts of the soviet union, to Poland and Czechoslovakia, to Yugoslavia and Greece, including Crete and other islands; to Norway, Denmark, the Netherlands, Belgium, Luxembourg, France and Italy.

Thus, Germans who take part in wholesale shooting of Polish officers or in the execution of French, Dutch, Belgian or Norwegian hostages or of Cretan peasants, or who have shared in slaughters inflicted on the people of Poland or in territories of the soviet union which are now being swept clear of the enemy, will know they will be brought back to the scene of their crimes and judged on the spot by the peoples whom they have outraged. Let those who have hitherto not imbued their hands with innocent blood beware lest they join the ranks of the guilty, for most assuredly the three Allied powers will pursue them to the uttermost ends of the earth and will deliver them to their accusers in order that justice may be done.

The above declaration is without prejudice to the case of German criminals whose offenses have no particular geographical localization and who will be punished by joint decision of the governments of the Allies.

The Moscow meeting was important for its demonstration of the complete accord between the three nations to wage the war to the end against the nazis; and on Nov. 5 the United States senate, by the overwhelming vote of 85 to 5 adopted almost word for word article 4 of the Moscow declaration.

In November, President Roosevelt and Prime Minister Churchill met Generalissimo Chiang Kai-shek at Cairo (Nov. 22–26) and agreed to divest Japan of all the territory she had stolen since she began her career of aggression in the far east.

The text of the Cairo statement, dated Dec. 1, 1943, was as follows:

The several military missions have agreed upon future military operations against Japan.

The three great Allies expressed their resolve to bring unrelenting pressure against their brutal enemies by sea, land and air. This pressure is already rising.

The three great Allies are fighting this war to restrain and punish the aggression of Japan.

They covet no gain for themselves and have no thought of territorial expansion.

It is their purpose that Japan shall be stripped of all the islands in the Pacific which she has seized or occupied since the beginning of the first World War in 1914, and that all the territories Japan has stolen from the Chinese, such as Manchuria, Formosa and the Pescadores, shall be restored to the Republic of China.

Japan will also be expelled from all other territories which she has taken by violence and greed.

The aforesaid three great powers, mindful of the enslavement of the people of Korea, are determined that in due course Korea shall become free and independent.

With these objects in view, the three Allies, in harmony with those of the United Nations at war with Japan, will continue to persevere in the serious and prolonged operations necessary to procure the unconditional surrender of Japan.

From Cairo Roosevelt and Churchill flew to Tehran, Iran, where they met Marshal Stalin and in a four-day conference mapped the plan of an all out attack on Hitler's "European Fortress."

The text of the declaration signed by President Roosevelt, Prime Minister Churchill and Premier Stalin at Tehran is as follows:

We, the President of the United States of America, the Prime Minister of Great Britain, and the Premier of the soviet union, have met in these four days past in this the capital of our ally, Tehran, and have shaped and confirmed our common policy.

We express our determination that our nations shall work together in the war and in the peace that will follow.

As to the war, our military staffs have joined in our round-table discussions and we have concerted our plans for the destruction of the German forces. We have reached complete agreement as to the scope and timing of operations which will be undertaken from the east, west and south. The common understanding which we have here reached guarantees that victory will be ours.

And as to the peace, we are sure that our concord will make it an enduring peace. We recognize fully the supreme responsibility resting upon us and all the United Nations to make a peace which will command good will from the overwhelming masses of the peoples of the world and banish the scourge and terror of war for many generations.

With our diplomatic advisers we have surveyed the problems of the future. We shall seek the co-operation and active participation of all nations, large and small, whose peoples in heart and in mind are dedicated, as are our own peoples, to the elimination of tyranny and slavery, oppression and intolerance. We will welcome them as they may choose to come into the world family of democratic nations.

No power on earth can prevent our destroying the German armies by land, their U-boats by sea, and their war plants from the air. Our attacks will be relentless and increasing.

Emerging from these friendly conferences we look with confidence to the day when all the peoples of the world may live free lives untouched by tyranny and according to their varying desires and their own consciences.

We came here with hope and determination. We leave here friends in fact, in spirit, and in purpose.

Signed at Tehran, Dec. 1, 1943.

ROOSEVELT, STALIN, CHURCHILL.

The text of the statement on Iran, signed at Tehran, is as follows:

The President of the United States of America, the Premier of the U.S.S.R., and the Prime Minister of the United Kingdom, having consulted with each other and with the Prime Minister of Iran, desire to declare the mutual agreement of their three governments regarding relations with Iran.

The governments of the United States of America, the U.S.S.R. and the United Kingdom recognize the assistance which Iran has given in the prosecution of the war against the common enemy, particularly by facilitating the transportation of supplies from overseas to the soviet union. The three governments realize that the war has caused special economic difficulties for Iran and they agreed that they will continue to make available to the Iran government such economic assistance as may be possible, having regard to the heavy demands made upon them by their world-wide military operations and to the world-wide shortage of transport, raw materials and supplies for civilian consumption.

With respect to the postwar period, the governments of the United States of America, the U.S.S.R. and the United Kingdom are in accord with the government of Iran that any economic problem confronting Iran at the close of hostilities should receive full consideration along with those of other members of the United Nations by conferences or international agencies, held or created, to deal with international economic matters.

The governments of the United States of America, the U.S.S.R. and the United Kingdom are at one with the government of Iran in their desire for the maintenance of the independence, sovereignty and territorial integrity of Iran. They count upon the participation of Iran, together with all other peace-loving nations in the establishment of international peace, security and prosperity after the war, in accordance with the principles of the Atlantic Charter, to which all four governments have continued to subscribe.

Both President Roosevelt and Vice-President Wallace visited Latin American countries in 1943, the president stopping off at Brazil on his way back from Africa in February, and the next month conferring with President Camacho at Monterrey, Mexico. Both visits resulted in valuable negotiations on the aid which those countries could furnish to the cause of the United Nations in their contribution of indispensable metals, airfield facilities, and general co-operation. In March and April, Wallace, an enthusiastic student of Spanish, made a good-will tour of South America (bypassing only Argentina, whose disposition toward the United States and the United Nations was far from friendly). On Sept. 15 the 21 republics of the continent were represented in an educational conference at Panama. The United States continued, in spite of some severe criticism, to spend large sums of money to secure the good will of the Latin American countries. (*See* also HISPANIC AMERICA AND WORLD WAR II.)

For the progress of the war *see* WORLD WAR II.

In a radio address on Christmas eve President Roosevelt reported to the nation on his meetings with the statesmen at Cairo and Tehran, and announced that General Dwight D. Eisenhower would be transferred from Cairo to London to direct the "second-front" assault on the continent. He warned that a bitter battle

was before the American people; but he was confident of the outcome. (D. S. Mu.; X.)

Education.—*See* the articles EDUCATION; UNIVERSITIES AND COLLEGES.

Defense.—For information about the armed forces of the United States in 1943, *see* AIR FORCES OF THE WORLD; MARINE CORPS; NATIONAL GUARD; NAVIES OF THE WORLD; WORLD WAR II. *See* also CIVILIAN DEFENSE.

Finance and Banking.—Statistics pertaining to the United States will be found in such articles as BANKING; BUDGET, NATIONAL; BUSINESS REVIEW; NATIONAL DEBT; NATIONAL INCOME AND NATIONAL PRODUCT; STOCKS AND BONDS; TAXATION; WEALTH AND INCOME, U.S. DISTRIBUTION OF.

Foreign Trade.—The U.S. department of commerce announced in Jan. 1942 that it would cease publication of its monthly summaries of U.S. foreign commerce, as of Oct. 31, 1941, in order to prevent giving vital information to the enemy. For such information as was available in 1943, *see* BUSINESS REVIEW; FOREIGN ECONOMIC ADMINISTRATION; INTERNATIONAL TRADE.

Communication.—For statistics, *see* the articles AVIATION, CIVIL; CANALS AND INLAND WATERWAYS; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION; POST OFFICE; RADIO; RAILROADS; SHIPBUILDING; SHIPPING, MERCHANT MARINE; TELEPHONE.

Agriculture.—Statistical material pertaining to this subject may be found under AGRICULTURE; also in the articles on separate crops and agricultural products.

Manufacturing.—The report of the department of commerce biennial census of manufactures for 1939, issued Jan. 15, 1941, estimated the number of establishments at 184,244; salaries and wages at $11,631,967,995 and value of products at $56,828,807,223. The 1941 census was not taken because of World War II, and after the U.S. entrance into the war, no complete overall figures for U.S. industrial production were issued. *See* BUSINESS REVIEW and WAR PRODUCTION, U.S. for industrial trends in 1943.

Labour.—For data on labour in 1943, *see* the articles AMERICAN FEDERATION OF LABOR; CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOUR UNIONS; RELIEF; SOCIAL SECURITY; STRIKES AND LOCK-OUTS; UNEMPLOYMENT; WAGES AND HOURS.

Mineral Production.—The U.S. department of the interior, for reasons of military security, issued no statistics on U.S. mineral production in 1942–43. (For such information as was passed by the censor in 1943, *see* the articles on individual minerals; also MINERAL AND METAL PRODUCTION AND PRICES; STRATEGIC MINERAL SUPPLIES.) (X.)

U.S. Investments Abroad.

There was no complete survey of American investments abroad after 1940, when holdings were valued at approximately $11,000,000,000, as indicated in the table on page 721. However, the United States treasury department conducted during 1943 the most comprehensive census of American property in foreign countries ever undertaken. All persons owning property in foreign countries were required to report their holdings on or before Dec. 1, 1943, with certain relatively minor exceptions—chiefly holdings in specified categories valued at less than $10,000. The results of this census, when tabulated, were expected to provide almost complete data on foreign assets, information which would be extremely valuable to business men, government officials, and all others interested in international economic relations.

The United States government emerged as the major supplier of American capital to foreign countries, as huge sums were placed abroad to facilitate the production of many and varied commodities vital to the successful prosecution of the war. Most of these enterprises were financed by the various subsidiaries of the Reconstruction Finance corporation, although the $130,000,000 Canol project, providing petroleum facilities in northwestern Canada, was an army undertaking. Another major enterprise in Canada was the Shipshaw plant of the Aluminum Company of Canada, Ltd., constructed with funds supplied in part by the Metals Reserve company in the form of advance payments for future production. Rubber developments were promoted by the United States government in various Latin American countries, and the cultivation of abaca and other fibre plants was en-

couraged to replace lost far eastern supplies. In addition, of course, large sums were "invested" in military and semi-military installations around the world. Investments and other expenditures by United States government agencies in Latin America became a subject of political controversy during the closing months of the year, the debate serving to focus public attention on these matters and to bring to light correct data regarding the financial extent of the operations.

In spite of the war, the years 1942 and 1943 produced considerable activity on the part of private American capital seeking new investment outlets abroad. Stimulated by rising prices for Canadian bonds in the U.S. and perhaps by anticipation of a return to par of the Canadian dollar, purchases by American investors of outstanding Canadian securities amounted to some $97,000,000 in 1942 and $119,000,000 in the first nine months of 1943, according to the dominion bureau of statistics. The participation of American capital in the exploitation of the Steep Rock iron deposits in Canada was accomplished through a public offering of securities of the Canadian corporation developing the properties, and during the year it was also announced that work was proceeding on U.S.-owned iron ore properties in Venezuela, with scheduled development and construction costs of about $25,000,000 envisaged. Other acquisitions or expansions included a pharmaceutical concern and a pulp mill in Canada, an air line, a plant for manufacturing flavouring syrups for soft drinks, and several finance-investment firms in Mexico, tire plants in the last-named country and in Cuba, and a substantial interest in the TACA air routes in the Caribbean. While the amount of capital involved in these enterprises was small in comparison to the great exodus of American capital in the '20s, it was evident that private funds were still available for foreign investment if the attendant circumstances appeared favourable.

On Sept. 29, 1943, the state department announced that an agreement had been reached with Mexico, by which the government of the latter country would pay some $29,000,000 for most of the American-owned petroleum properties expropriated in 1938. Acceptance of the settlement by the principal claimant, the Standard Oil Company of New Jersey, was announced on Oct. 1, thus apparently bringing to a close one of the bitterest disputes in the history of American industry abroad. One of the other major companies involved, the Sinclair Oil corporation, had settled its claims directly with the government of Mexico in 1940, and received the final installment of an $8,500,000 award in 1943.

By decree law no. 6019, dated Nov. 23, 1943, the government of Brazil established a new plan for the servicing of the external debt of that country which was considerably more liberal in its terms than the one prevailing in recent years. The decree was the outcome of extended negotiations between the government and representatives of the bondholders and presumably represented a definitive and final settlement, providing, as it did, for regular annual amortizations of the principal amounts outstanding.

The government of El Salvador, in a decree dated Nov. 12, 1943, imposed an increased export duty on coffee, the proceeds of which were to be devoted to servicing the external debt, in default since 1937.

Details of the application of these funds remained to be determined by negotiation.

Perhaps the most significant development during 1943 affecting U.S. foreign investments was the rather widespread attention being devoted to the postwar role of American capital abroad. The department of commerce, in its publication *The United States in the World Economy*, stated: "In view of our high standard of living and enormous capacity for saving, it is both natural and logical that American capital should resume investment activity abroad on a scale large enough to sustain this country's export trade and concurrently support reconstruction and development programs in foreign countries." This point of view seemed to have been widely accepted on the ground that it would be to the mutual advantage of debtor and creditor alike if future investments take the form of direct participation in the ownership and management of industrial and commercial enterprises, rather than the public flotation of bond issues of foreign governmental entities—national, provincial or municipal.

Another phase of the problem that received attention was the question of joint participation with local capital in the countries where investments are to be made. A trend in this direction was especially noticeable during the decade of the '30s in Great Britain, where many leading American-owned companies offered securities to the British public. Several of the financial firms organized in Mexico in 1943 represented joint ventures of United States and Mexican capital. In an article in the *Harvard Business Review*, Kuang Tai Hu, a Chinese graduate student at the university, expressed the opinion that foreign capital would be welcomed in China after the war only on terms which would leave a considerable share of the investment and voice in the management in the hands of the Chinese.

Official importance attached to postwar international capital movements and the related problem of exchange stability was evidenced by the drafting of elaborate, though tentative, plans for international stabilization funds and a world bank. These plans, prepared by both British and American government experts, were widely discussed in the press, and in financial and economic journals. At the close of the year, however, the extent and character of the international movement of capital in the postwar period still remained to a large degree unforeseeable, although there was little, if any, lack of agreement as to the importance of the problem and the necessity for discovering a workable solution. (R. L. Ss.)

Universities and Colleges. The following seven pages carry a selected list of universities, colleges and junior colleges in the U.S. and Canada, with location, year founded, chief executive, enrolment, size of faculty, endowment and number of library volumes, for the academic year 1943–44. An asterisk denotes 1942–43 data; two asterisks denote data previous to 1942–43. (*See* also EDUCATION.)

UNRRA: *see* UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION.

Upshur, William Peterkin

(1881–1943), U.S. marine corps officer, was born Oct. 28 in Richmond, Va. After graduating from the Virginia Military institute, 1902, he was commissioned a 2nd lieutenant in the marine corps. He won several awards including the congressional medal of honour for his service in Haiti in 1915. During World War I, he went to France to take charge of the military prison at Bordeaux; later he was shifted to command of the guard camp at Bassens. A graduate of the U.S. Army Command and General Staff school, the Naval War college and the Army War college, he was made a brigadier general in 1938, and given command of the fleet marine force. He had been on duty in the Philippines and China, at Washington headquarters of the marine corps and saw service at sea. In Oct. 1939 he was promoted to major general, was later put in charge of the marine corps base at San Diego and in Nov. 1941 was named commanding general of the marine corps department of the Pacific with headquarters at San Francisco. He was killed July 21 in the crash of a naval aeroplane near Sitka, Alaska.

Uranium.

Comments made under the subject of radium, vanadium (*q.v.*) also apply to uranium, and little additional information was available in 1943. It was rumoured that German scientists were working intensively on the isolation of U_{235} from uranium, and the development of energy by atomic disintegration in the hope that something practical could be accomplished in time to be of help in winning the war. (*See* also RADIUM.)

(G. A. Ro.)

Urology.

According to data published regarding the treatment of gonorrhoeal urethritis in the armed forces, the sulfonamides proved to be effective agents in combating a

disease which had defied treatment over the centuries. It was estimated that infection in the urethra with *Neisseria gonorrhoeae* can be eliminated by medication with sulfonamide compounds, if they are adequately employed, in from 80% to 90% of cases. It was recognized, however, that in approximately 10% of the cases of gonorrhoeal urethritis sulfonamide therapy fails. It was found that this failure is due largely to inherent qualities of the *Neisseria gonorrhoeae* which render them sulfonamide resistant in varying degrees. The degree of resistance to sulfonamide compounds could in 1943 be determined by means of comparatively simple laboratory tests.

During 1943 it was shown that penicillin also will eliminate gonorrhoeal urethritis and apparently even more efficiently than the sulfonamides. In fact, it was found that penicillin will overcome gonorrhoeal infection in at least 98% of cases and, of even greater importance, the infection will be eliminated within about 48 hours. Owing to the scarcity of penicillin, its use was confined largely to those cases of gonorrhoeal urethritis in which the infections were resistant to sulfonamide medication. In all of these resistant cases reported thus far the gonorrhoeal infection was eliminated by penicillin. The absence of any toxic reaction following the administration of penicillin is an important advantage of penicillin over sulfonamide medication. Penicillin, besides being used in treatment of gonorrhoeal urethritis of the male, also was used in the treatment of gonorrhoeal infection in the female pelvis and of gonorrhoeal proctitis, with equally good results.

Pyrogen free penicillin, dissolved in a physiologic solution of sodium chloride, may be administered either intravenously by the drip method, or intramuscularly at intervals of three hours. The administration of penicillin must be continuous or nearly continuous in the treatment of severe gonorrhoeal infections. Because of the difficulty of production, penicillin compounds, unfortunately, were not universally available in 1943.

Early clinical results following bilateral orchiectomy (excision of both testicles) in cases of carcinoma of the prostate gland were often so favourable that it was thought the operation might control the malignant lesion permanently. Further observations on late results of orchiectomy in the treatment of prostatic carcinoma, however, raised some doubt as to the efficacy of the procedure. In fact, postoperative results were disappointing in so many cases that many urologists questioned the advisability of routine orchiectomy in these cases. Some observers went so far as to claim that orchiectomy seems to stimulate the malignant process after an early stage of improvement.

Many urologists claimed that the clinical results of the administration of female hormones in cases of prostatic carcinoma are as good as, or better than, those after orchiectomy. They were of the opinion that androgenic stimulation can be controlled in this manner more completely than by orchiectomy. One of the advantages claimed for administration of estrogenic compounds is the fact that the estrogenic hormone will neutralize androgenic secretion in tissues other than the testicle. Orchiectomy alone will eliminate only such androgenic stimulation as has its origin in testicular tissue. The amount of estrogenic drug needed to neutralize androgenic stimulation was not in 1943 standardized. Some clinicians advised a dosage of only 1 or 2 mg. daily, while others employed much larger amounts. Some urologists employed orchiectomy and followed it up by the administration of estrogenic drugs. Some clinicians believed that the potency of estrogenic therapy is not as great when a preparation containing estrogenic hormone is administered following orchiectomy. The administration of estrogenic drugs may be difficult in some cases because of systemic reaction, characterized by hot flushes, nausea, weakness, or pain with swelling in the mammary gland.

Opinions differed as to when these measures should be employed in the treatment of prostatic carcinoma. Most clinicians favoured immediate employment of these measures in order to prevent progress of the malignant lesion. Others favoured postponement of both orchiectomy and administration of estrogenic hormones until there is clinical evidence of metastasis.

The results of the treatment of interstitial cystitis and other forms of painful cystitis with instillations of silver nitrate indicated that this method offered permanent relief in approximately 60% of cases. In some cases in which symptoms recurred, a repetition of treatment with silver nitrate at intervals controlled the symptoms. The combination of wide overdistention of the bladder, while the patient was under general anaesthesia, with subsequent instillations of silver nitrate, gave permanent relief in other cases. In some cases continuous lavage of the bladder with a solution of silver nitrate (1:1,000) for several days brought relief. (W. F. Br.)

Uruguay. A republic on the southeastern coast of South America, between Argentina and Brazil. It is the smallest republic on the continent (area: 72,153 sq.mi.), but the most densely populated (pop., official est. Dec. 31, 1940: 2,164,000). Capital city: Montevideo (pop. est. 1941: 770,000); other cities, with estimated populations: Paysandú (50,000); Salto (48,000); Mercedes (33,000); Lavalleja (30,000); Tucuarembo (30,000); Artigas (28,500); Rivera (22,000); Treinta y Tres (21,500). President in 1943 (inaugurated March 1): Juan José de Amézaga.

History.—Uruguay's new Liberal president, Juan José de Amézaga, assumed the executive office on March 1, and continued the active collaboration in inter-American defense laid down by his party in 1941 and 1942. In January the vice-president-elect, Alberto Guani, visited the United States, and while there signed agreements with the Export-Import bank covering a loan of $20,000,000, to be used in a public improvements program in Uruguay. The Uruguayan government announced early in 1943 that diplomatic relations would be resumed with Russia, with whom such contacts had been broken in 1936. Relations with Vichy France, however, were severed on May 12.

The new administration started its internal program with severe handicaps to overcome. In addition to the usual problems of wartime, Uruguay was faced with the most severe drought in a number of years. In an effort to decrease unemployment the government inaugurated a public works construction program, and on May 3 the president proposed legislation which would control monopolies and would serve as a basis for price and wage control. During the first half of the year the labour situation remained unsatisfactory in view of low wages, a steady increase in living costs, and only slight improvement in regard to employment. Toward the latter part of the year, however, conditions improved. The drought was broken and agricultural prospects became brighter; wool production proved to be excellent in both quality and quantity. In July the Board of Economic Warfare in the United States released the ban on South American wools which had been in effect, and Uruguay was allowed to ship to the United States 60% of the amount of the 1941–42 export. The United States also started to import once more Uruguayan sheepskins. In October Great Britain signed a contract for the United Nations to take meats available for export in Uruguay for the year.

The steadily increasing favourable foreign trade balance caused some concern over inflation, with some leaders favouring nationalization of foreign-owned utilities as a desirable measure to prevent it, and others desiring the surplus to go into repatriation of the sterling debt of £18,000,000.

Rationing continued in force during 1943, notably on gasoline

and kerosene, and price control was applied on many items.

Education.—Education is compulsory and free; the system is considered one of the more progressive of South America. Primary schools numbered approximately 1,700 (in 1941); enrolment was more than 200,000.

Finance.—The monetary unit is the peso (value in 1943: approximately 52⅔ cents U.S.). The 1943 budget estimated revenue at 112,912,000 pesos; expenditures at 112,649,000 pesos. It was expected that 1943 would end with a deficit of 20,000,000 pesos; 1944, with a deficit of 30,000,000 pesos. The funded public debt (Dec. 31, 1941) was 449,531,175 pesos, with an additional 94,500 peso international debt.

Trade and Communication.—For the first half of 1942 exports were valued at $33,147,779; imports at $32,517,549. In 1943 imports from the United States (about 26% in 1941) and the United Kingdom (15% in 1941) declined, and imports from Latin American countries increased. Uruguay had a favourable trade balance with the United States, for nine months of 1943, of $27,370,000. Wool exports from Oct. 1, 1942–Sept. 30, 1943, amounted to 103,605 bales (1941–42: 57,009 bales). Coal imports for the year ending June 30, 1943, were 265,654 short tons. Because of the drought Uruguay had to import potatoes.

External communication is by sea and air, with rail connection to Brazil and Argentina. Highway mileage is 22,500 mi., of which 1,500 mi. is paved. Bus and truck traffic was seriously curtailed in 1943 by lack of gasoline. There are 1,527 mi. of railways; speeds were reduced on these in order to conserve irreplaceable steel rails.

Agriculture and Manufacturing.—Uruguay is primarily pastoral (sheep and cattle). An unofficial estimate indicated that 20,000,000 to 22,000,000 sheep were being raised; the wool clip (Oct. 1, 1942–Sept. 30, 1943) was 67,168 short tons (1941–42: 55,945 short tons). Stock slaughterings (nine months ending Sept. 30, 1943) were: cattle, 1,030,146 head; sheep, 972,454 head. Agricultural production for the first half of 1943 (in short tons) was: wheat 364,034; rice 15,225; corn 40,091; barley 9,666; oats 33,983; potatoes 45,984; flax 51,223. Linseed production for the 1942–43 year was officially estimated at 54,013 short tons.

The more important manufacturing industries include meat-packing products, textiles, leather goods (for domestic consumption), hats, and wines in their output. During 1943 the textile mills exported many shipments to South Africa. (*See* also ARGENTINA; HISPANIC AMERICA AND WORLD WAR II.)

(D. RD.)

U.S.O.: *see* UNITED SERVICE ORGANIZATIONS.

U.S.S.R.: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Utah. A Rocky mountain state, admitted to the union in 1896, popularly known as the "Mormon state." Area 84,916 sq.mi. (82,346 sq.mi., land; 2,570 sq.mi., water); pop. (1940) 550,310. The rural (nonfarm) population was 150,465, (farm) 94,352; urban 305,493, with the following origins: white (native) 510,662, (foreign born) 32,298; Negro (native) 1,225, (foreign born) 10. Capital, Salt Lake City (149,934). Other principal cities are Ogden (43,688), Provo (18,071) and Logan (11,868).

History.—In 1943 the administration of the Democratic governor, Herbert B. Maw, co-operated with federal authorities in essential war measures, while business and industrial interests aided in the expansion of mining and metallurgical industries which were stimulated by war exigencies.

In 1943 E. E. Monson continued as secretary of state; Reese M. Reese, auditor; Oliver G. Ellis, treasurer; Grover A. Giles, attorney general; and Charles H. Skidmore, superintendent of public instruction.

Education.—There were 143,448 children in the public schools in 1943, a drop of 5,184 from the 1942 figure. The total cost of education was $13,197,010.38, with $11,377,231.18 devoted to operating expenses. There were 4,102 teachers and 434 principals.

Public Welfare, Charities, Correction.—Total obligations of $8,449,718.20 incurred in 1943 for public assistance were distributed as follows: old-age assistance, $5,564,421.14, aid to dependent children, $1,383,415.44; aid to blind, $53,537.54; general $672,191.53. A total of 15,780 households were receiving assistance in June 1943 as compared with 21,508 in Dec. 1941.

Services to children of working mothers, started in Feb. 1943, totalled $10,746.58.

Communication.—Highway mileage in 1943 was as follows: state, 5,450; county, 15,633; city, 2,412. There were 2,005 mi. of steam railway in 1942. State expenditures for roads in 1942 were approximately $6,051,071.14. Utah had 33 airports and fields in 1943.

Banking and Finance.—Fifty-seven banks, 45 state and 12 national, had total assets of $407,163,177.78 in 1943, and total bank deposits reached $384,020,790.45. In 1942 the state's 15 building and loan associations had aggregate assets of $20,926,166.17. State receipts for the year ending June 30, 1942 were $40,400,517.83; expenditures were $37,383,310.21. The total of outstanding bonds in 1942 was $1,695,000, with this amount available from the state liquor control fund for retirement of all outstanding bonds.

Agriculture.—Cash income from farm marketings was $71,506,000 during Jan.–Sept. 1943 as compared with $53,083,000 for the same period in 1942. Producers increased the farm yield as part of the war program. Value of 1943 truck and canning crops was $5,882,000; for 1942, $4,036,000. Value of canning tomatoes in 1943 was $1,621,000, and shipping tomatoes, $286,000.

Table I.—*Principal Agricultural Products of Utah, 1943 and 1942*

Crop	1943	1942
Hay (tame and wild), tons	1,158,000	1,174,000
Potatoes, bu.	3,430,000	2,312,000
Sugar beets, short tons	478,000	572,000
Celery, crates	183,000	132,000
Tomatoes, fresh, bu.	130,000	35,000
" processing, tons	73,000	82,700
Onions, 100-lb. sacks	300,000	264,000
Peas, tons	25,520	20,080

Manufacturing.—The upward trend in manufacturing continued in 1943, with new industries enabling Utah not only to hold its population but to attract newcomers to defense industries. Workers numbered 30,700 in 1942 as compared with 20,300 in 1941, and only 15,982 in the first quarter of the latter year. Total pay rolls in manufacturing were estimated at $67,569,943 in 1943 as compared with $50,939,000 in 1942.

Mineral Production.—The United States war program gave sharp impetus to the state's greatest industry, with important production of copper, lead, and zinc and activity in vanadium, tungsten and potash. In gold production, Utah jumped from fourth to first place among the states of the union because of its copper mines, which produce both metals. In 1943 the state had an estimated production of 381,763 fine ounces of gold and 9,308,520 fine ounces of silver, as compared with 391,544 fine ounces of gold in 1942 and 10,574,955 fine ounces of silver in the same year.

Table II.—*Mineral Production of Utah, 1943 and 1942*

Mineral	1943 (est.)	1942
Copper, lb.	646,100,000	613,382,000
Lead, lb.	132,500,000	143,860,000
Zinc, lb.	93,534,000	91,086,000
Value of all ores	$124,348,439	$113,552,848

Activity continued in connection with expansion of the pig iron plant and coking coal mine near Cedar City. (F. W. GA.)

Utilities, Public: *see* PUBLIC UTILITIES.

Vanadium. Explorations developed new deposits of vanadium in Idaho and Wyoming, and other areas might provide some supply if methods could be devised to recover the metal from low-grade ores. These sources would supplement the domestic supply formerly obtained from Colorado and Utah. Peruvian production capacity was enlarged in order to assure an adequate supply. During 1943, vanadium was shifted from the list of metals short in supply to those with adequate supply for essential requirements. (G. A. Ro.)

Vandegrift, Alexander A. (1887–), commandant of the U.S. marine corps, was born March 13 in Charlottesville, Va. He entered the corps as a second lieutenant in 1909, took part in the landing in Nicaragua in 1912 and at Veracruz in 1914. In World War I, however, it was his fate not to fight against Germany but to stay in Haiti, helping keep peace there. Vandegrift first came to public attention in 1927 on the China coast when he sent marine planes into the air to threaten Japanese observation planes which, despite his warnings, persisted in photographing U.S. fleet manoeuvres. Fifteen years later, a major general and assistant commandant of the marine corps, he engaged the Japs in earnest as leader of the Solomon Islands campaign and "hero of Guadalcanal." His victories won for him the congressional medal of honour and promotion to lieutenant general. On Nov. 1, 1943, he led the marines again in their first landing at Bougainville. Shortly afterward he was recalled to Washington to succeed Lt. Gen. Thomas Holcomb, retired, as commandant of the marine corps on Jan. 1, 1944.

Varnishes: *see* PAINTS AND VARNISHES.

Vasilevsky, Alexander Mikhailovich (1897?–), Russian army officer, was a Czarist soldier during World War I and joined the proletariat during the revolution of 1917. A product of the Russian general staff schools, he helped reorganize the soviet armies after the Russo-Finnish war, 1939–40. Attached to the Russian high command since 1941, Vasilevsky served under Marshal Georgi Zhukov, who later became subordinate to his former aide as chief of the operational staff. Vasilevsky, who held the rank of major general in 1941, rose to the rank of marshal in 18 months, and in Nov. 1942 he succeeded Marshal Boris Shaposhnikov, who was reported in ill health, as Russian chief of staff. The appointment of Vasilevsky was part of Stalin's plan to revitalize and reorganize his general staff. The soviet premier dropped the old triumvirate of Budenny, Timoshenko and Voroshilov from their former positions of prominence and replaced them with seven of his "younger generals"; Vasilevsky was regarded as the best fitted for the position of chief of staff. Under his guidance, the younger generals scored brilliant successes at Stalingrad, in the Russian summer offensive of 1943 and the winter campaign of 1943–44.

Vassar College. A college for women at Poughkeepsie, N.Y., founded by Matthew Vassar in 1861. As an emergency measure in order to train students more quickly for war work and reconstruction activities, the college put into operation in Sept. 1943 a three-year course for the bachelor's degree. The academic year was lengthened to 40 weeks.

The curriculum was revised to adapt it to both the three-year and the four-year schedule and to realize more fully the basic Vassar aim of education for social use, but there was no change in the quantity or quality of work required for the degree. The curriculum still lay wholly within the field of the liberal arts. New courses introduced during 1941–43 as specific preparation for war service, such as meteorology, radio and vacuum tube applications, and intensive work in translation of foreign languages were continued. To foster individual and group competence and responsibility, as well as to meet the labour shortage and to reduce cost of education to the student, every student gave an hour a day to household work. This co-operative system was organized under student supervision in close relation to the student government. For statistics of the faculty, student enrolment, endowment, etc., *see* UNIVERSITIES AND COLLEGES.
(H. N. MacC.)

Vatican City State. A sovereign independent state, established by the Lateran treaty between the Holy See and the royal Italian government, Feb. 11, 1929. The treaty is recognized in international law, and the reigning pope is the sovereign. The area of Vatican City is 108.7 ac. It has its own railroad station, radio station, postal and aerial system and currency. Total issue of bronze, nickel, silver and gold coins is not to exceed 1,000,000 lire. Executive powers are exercised by the governor, responsible only to the pope; administrative power is exercised by a commission of cardinals, which in 1943 rearranged the civil service in 11 distinct groups.

The population of Vatican City in 1943 numbered in excess of 800, to which was added the Vatican diplomatic colony representing the nations who broke off relations with the axis powers.

Ambassadors and ministers accredited to the Vatican in 1943 were 37. Ambassadors and ministers of China, Italy, Finland and Rumania presented their credentials to the pope. Archbishop Godfrey, apostolic delegate to Britain, was appointed Vatican chargé d'affaires to the Polish government in London.

Allied planes bombed Rome July 19, and the patriarchal basilica of San Lorenzo fuori le Mura, Vatican property, was severely damaged. Immediately following the bombing the pope visited the bombed district. Blood spots were observed on the pope's white cassock. Radio Vatican denied German and Italian reports that the pope had protested to President Roosevelt on July 24. German troops assumed protection of the Vatican Sept. 10, and on Sept. 15 restricted the use of Radio Vatican. The pope protested Sept. 16 to Gen. Albert Kesselring against the closing of St. Peter's to Italians, and on Sept. 21 church dignitaries entering Vatican City were held by the Germans. On the same day ten cardinals were reported to be under house arrest by order of the German commander, and on Sept. 24 German troops were placed at the entrance to Vatican City.

Papal guards were increased Oct. 7, and later Hitler's reported offer of asylum in Lichtenstein or Germany was rejected by the pope. Notices of inviolability were posted at the entrance to Vatican City Oct. 13, but on Oct. 29 Germany pledged to respect the person of the pope and the neutrality of Vatican City.

Vatican City was bombed by an unidentified plane Nov. 6, damaging buildings, but there were no casualties. Gen. Dwight Eisenhower, U.S.A., declared no Allied planes were over Rome that day.

In the city of Rome there were 446 churches in 1943, of which 106 were parish churches. (*See* also PIUS XII; ROMAN CATHOLIC CHURCH.) (J. LaF.)

Vatutin, Nikolai Fedorovich (1900?–), a Russian army officer, was a private in World War I. During the revolution of 1917, he joined the bolsheviks and rose to the rank of a cavalry division commander. He was commander of one of the Russian armies that recaptured

Kharkov in 1943. After the Russians launched their big drive in the summer of 1943, Vatutin was in command of soviet armies that cracked German defenses in the Ukraine, crossed the Dnieper river, captured Kiev and later swept through Korosten and Zhitomir. His advance was too rapid for his slower-moving supply lines and he was compelled to evacuate both Korosten and Zhitomir in Nov. 1943 under the impact of a strong German counterblow. Vatutin quickly shifted his strategy, whittled down the strength of the German drive and had halted the nazi offensive by December. His army then resumed the offensive, recaptured Korosten and Zhitomir and by Jan. 1944 had crossed over the boundaries of prewar Poland.

Vegetable Oils and Animal Fats. The production of fats and oils in the United States increased in 1943 to an estimated total of 11,200,000,000 lb. compared with an output of 10,600,000,000 lb. in 1942, according to revised estimates by the U.S. department of agriculture. Stocks at the beginning of the season, Oct. 1, were 80,000,000 lb. larger in 1943 than in 1942 and there was also an increase in imports. The principal forms of fats and oils included in the supply were: lard and pork fats 3,200,000,000 lb.; butter 1,960,000,000 lb.; inedible tallow and greases 1,650,000,000 lb.; cottonseed oil 1,240,000,000 lb.; soybean oil 1,300,000,000 lb.; linseed oil 900,000,000 lb.; corn oil 240,000,000 lb. and peanut oil 185,000,000 lb. There were also smaller amounts of olive, wool oil, tung, fish, etc. The greatest increase was in soybean oil, which nearly tripled in three years. Pork fats accounted for a large part of the increase in 1943, a product of the great increase in hog numbers. Lard production reached a new high point since 1919, cottonseed was below the level of 1926–36 and butter production declined. Peanut-oil production did not increase like the crop, since most of this increase was used for peanut butter, candy and salted nuts.

Requirements for fats were increasing in 1943. Lend-lease shipments were heavy, military needs expanded and preliminary steps were being taken to build up some stocks for relief. Domestic consumption of food fats and oils were about 46 lb. per capita in 1943 compared with a prewar average of about 48 lb. in 1935–39. The principal decline was in butter, which was down about 4 lb. from the 1935–39 average. This was partially offset by an increase of 1 lb. in margarine. The use of lard and rendered pork fat was up to 14.3 lb. per capita, compared with the average of 11 lb. Shortening was down to 9.1 lb. compared with 11.9 in 1935–39. Exports were about 50% greater in 1943 than in 1942 and a larger quantity was taken for the manufacture of munitions. Even with price ceilings in effect the continued high level of employment resulted in a strong demand.

The production of oil-bearing crops, soybeans, peanuts and cottonseed must be increased in 1944 to meet the growing needs and provide any surplus for relief purposes, should large areas be liberated in Europe in 1944. Both soybeans and peanuts increased in 1943 but the crop of cottonseed was down about 11% from the previous year. The plans for 1944 called for further expansion in oil seeds of all kinds, soybeans 20% and peanuts 30%. This increase in the oil-bearing crops was considered of vital importance because of the expected decline in butter and pork-fat production. (*See* also BUTTER; COCO-NUTS; COTTON; PEANUTS; SOYBEANS.) (J. C. Ms.)

U.S. Production of Principal Fats and Oils

Veidt, Conrad (1893–1943), British actor, was born Jan. 22 in Berlin. He received his early theatrical training under Max Reinhardt and had a successful stage career before appearing in motion pictures. Tall, slim, of aristocratic bearing and a skilled linguist, Veidt portrayed "villains" with such consummate skill that he frequently "stole the show" from the stars. He went to the United States in 1926 to appear in a movie version of François Villon and though he had hoped some day to return to Germany to continue his career, the rise of naziism changed his plans. He became a British citizen in 1938. His first important motion picture role was in *The Cabinet of Dr. Caligari.* He was later seen in *Power, Dark Journey, I Was a Spy, The Passing of the Third Floor Back, All Through the Night, U-Boat 29, A Woman's Face, Whistling in the Dark, The Men in Her Life, Escape, Blackout, Rome Express, The Devil is an Empress, Nazi Agent* and *Casablanca.* He died in Hollywood, Calif., April 3.

Veiller, Bayard (1869–1943), U.S. playwright, was born in Brooklyn, N.Y. His early interest in the theatre was dampened by an unfavourable criticism of his first script and he gave up his college career and turned to reporting. He moved westward, became in turn a logger and stock company manager. Returning to the theatre, he produced a great number of his own plays, the most successful of which were *Within the Law* (1912), *The Thirteenth Chair* (1916) and *The Trial of Mary Dugan* (1927). For the movies, he wrote *Guilty Hands* and *Unashamed* and supervised the motion picture versions of *The Trial of Mary Dugan* and *The Thirteenth Chair.* He wrote an autobiography, *The Fun I've Had* (1941). Veiller died in New York city, June 16.

Venereal Diseases. Congress appropriated $12,500,000 for venereal disease control during the fiscal year 1943. State, local and other funds budgeted for this purpose totalled $8,772,578. There was a total of $19,368,458 available to the states and territories.

The aim of control activities was considered as not only the prevention of the usual wartime increases in the incidence of venereal disease but also the development of a foundation for strong and adequate resources for postwar control. This was in order to avoid repetition of the disastrous experience following World War I, when there was a virtual abandonment of many control measures.

In spite of war-induced shortages of personnel and supplies, the state health departments continued the steady expansion of their activities (Table 1). Increases were reported in the amount of drugs distributed; the number of clinics was increased; the number of clinic admissions for syphilis and for gonorrhoea totalled considerably more than in 1942.

Outstanding in the field of research was a report from the Venereal Disease Research laboratory, Staten Island, N.Y., upon investigations of the use of penicillin in the treatment of human syphilis. Syphilis prophylaxis in rabbits was being studied, using penicillin, arsenicals and other preparations. This led to the

treatment of four human cases of primary syphilis with penicillin. The four cases showed satisfactory clinical responses with no indications of any relapses, and the penicillin investigations were continued. Another report of interest from the same laboratory dealt with the use of penicillin sodium in sulfonamide-resistant gonorrhoea in men. The chemical was found to give evidence of being of great value (74 of 75 patients studied responded in a satisfactory manner with practically no reaction to the drug).

Perhaps the chief development of the year 1943, however, was the establishment by the public health service in co-operation with state departments of health and other public and private agencies of a network of rapid treatment centres, where infected persons—chiefly women—received intensive venereal disease therapy. Conceived as a wartime measure to check the spread of syphilis and gonorrhoea among the armed forces, war workers and selective service registrants, these institutions were primarily hospitals where the newer techniques in the treatment of syphilis and gonorrhoea were applied. The en masse demonstration of the effectiveness of the various intensive therapies afforded by the centres was considered as of paramount importance in that the medical profession might profit by the accumulated experience and the proving of techniques that might result. By the end of 1943 there were over 30 of these centres established over the United States, the Canal Zone, Puerto Rico and the Virgin Islands.

The public health service provided consultation services and supplied specially trained physicians, nurses and technical personnel to operate the centres. Former Civilian Conservation corps camps and National Youth administration resident centres and other types of existing buildings, renovated and adapted, were utilized. Syphilis treatment schedules under investigation during 1943 in these hospitals consisted of: One-day fever plus chemotherapy, 5-day drip, 10–20 Schoch method, 10–12 week Eagle, and variations of these. Sulfathiazole and sulfadiazine continued to be the drugs of choice in the treatment of gonorrhoea and were used in the rapid treatment centres. However, evidence accumulated in the centres in 1943 indicated that the proportion of so-called sulfa-resistant cases had increased; investigations were initiated to determine the causes in order to overcome this phenomenon.

In another phase of the national control program, a "national round-up" of Selective Service registrants with positive blood tests for syphilis was inaugurated toward mid-1943. The plan was designed to aid state health officers in achieving co-ordinated action between local health agencies and local Selective Service boards with the objective of making available for service a large number of men previously unavailable. Essential features of the plan were as follows: (1) Rapid medical reclassification by local health officers of each registrant with a positive blood test, and (2) notification to local boards of the medical availability of the registrant insofar as syphilis was concerned.

In 1943 considerable progress was made in the field of venereal disease control in industry. The recommendations of an advisory committee to the public health service, containing current authoritative information and formulating sound, basic principles applicable to any program of venereal disease control in industry, were presented to management, labour, the medical profession and public health authorities. For the first time a framework of adequate, uniform principles upon which to base desirable control programs in industry was therefore available. These principles proved generally acceptable and positive action upon them throughout the U.S. ensued. With continuing growth throughout 1944 in this field, a nationwide venereal disease control program in industry, integrated with the general health programs through the active co-operation of local health departments, was envisioned as one of the major advances in venereal disease control. (*See* also EPIDEMICS AND PUBLIC HEALTH CONTROL.)

(J. R. HR.)

Table I.—Venereal Disease Control Activities of State Health Departments

*End of calendar year. †In millions. ‡Estimate.

Venezuela. A republic of northern South America, with a coast line extending from Colombia on the west to British Guiana on the east. Area: 352,170 sq.mi.; pop. (1941 census): 3,847,051, not including approx. 100,000 Indians. Capital city: Caracas (268,808). Other cities (1936 census figures): Maracaibo (110,010); Valencia (49,214); Barquisimeto (36,429); Ciudad Bolívar (25,134); Puerto Cabello (20,622). President in 1943: General Isaías Medina Angarita.

History.—The year proved to be a fairly satisfactory one for Venezuela, with no change in general political policy taking place. The administration of President Medina Angarita retained most of the seats in congress in elections held Jan. 19, 1943.

The most significant development of the year was the enactment on March 13 of a new oil law settling the somewhat strained relations which had existed between the oil companies and the government, and to the general satisfaction of both sides. Under the new plan all companies and concessions were placed in an equal position under the law. Taxes were increased on surface lands, and some immunities from customs charges enjoyed by the companies were eliminated; the income of the government would be increased by 80% by these changes (the corporations likewise paid some 25,000,000 bolivars in disputed back taxes). At the same time the oil companies had their concessions lengthened to a period of 40 years, and their position was far more secure than before. The agreement also provided for an increase in production to about 200,000 bbl. per day, after the war.

On April 15 President Medina Angarita authorized the formation of a new political party, to be named the Partidarios de la Política del Gobierno, and designed to support the administration program. The move was partly in anticipation of the presidential election campaign of 1945 (President Medina Angarita in May stated that he would not be a candidate). Venezuela's other party is the Acción Democratica, some nine years old; it was believed the conservatives might form another organization for the coming campaign. In cabinet appointments made in May the administration showed a trend toward the left by inclusion of three men from liberal groups.

Economic conditions continued satisfactory in 1943, in spite of shortages. Ship arrivals increased, aiding retail trade.

Education.—The school system numbered (1942) some 5,600 elementary schools, with 295,400 students; 90 secondary and technical schools, enrolment over 7,000. There were two universities; modernization of the Central university at Caracas was being planned in 1943. The 1942–43 budget allotted 22,892,000 bolívars to education; in 1943–44 the amount was increased to 23,830,000 bolívars.

Finance.—The monetary unit is the bolívar, value approximately 30 cents U.S. in 1943. In the budget for 1942–43, revenues were estimated at 301,673,000 bolívars; expenditures at 319,553,000 bolívars; for 1943–44, revenue was estimated at 316,693,000 bolívars; expenditures 347,958,000 bolívars. In both budgets loans were planned to cover deficits. The national debt

amounted to 15,494,577 bolívars (Dec. 31, 1942), all internal. Note circulation amounted to 256,076,000 bolívars on June 30, 1943.

Trade.—In 1941 exports totalled 1,061,565,000 bolívars in value, of which petroleum formed 94.2% of the total. Other products exported were coffee, cacao, gold, hides and skins, pearls, balatá. Imports were valued at 287,736,000 bolívars, and were mainly foodstuffs, textiles and manufactures. Both imports and exports were down in volume in 1942, largely because of lack of shipping.

Resources.—Petroleum is the most important item produced in Venezuela; the output in 1942 was 155,800,000 bbl.; in 1941 it was 228,100,000 bbl. The drop in 1942 was due to the shortage of tankers. In normal times Venezuela is the third largest producer in the world.

Coffee forms the largest agricultural export. The 1942–43 crop was damaged by heavy rains; while the original estimate of production was for around 900,000 bags, in the period Oct. 1, 1942–Aug. 31, 1943, only 459,543 bags were harvested. The 1942–43 cotton crop was 3,779 short tons, about half of the expected crop, with much damage due to insects. Cacao output (1941) was 13,547 short tons. Normal production of salt is 24,802 tons; of coal, 5,512 tons.

Communication.—External communication is by steamer, Pan American Airways, and Royal Dutch Airways. Highways total 5,883 mi., with 3,600 mi. surfaced and improved. Due to lack of tires, it was estimated in 1943 that 6,000 cars were laid up. Railway mileage is 589 mi. The line called the "German railway" was blacklisted in Nov. 1943, and unable to operate because of lack of fuel was taken over by the government Nov. 16. There is likewise internal communication by domestic airlines, and on the Orinoco river and its tributaries by boat. (D. Rd.)

Vermiculite.

Sales of vermiculite in the United States in 1942 more than doubled over 1941, to 57,848 short tons. Prices increased slightly from the decline in 1941, the reported increase in total value being 155%, against one of 147% in tonnage. (G. A. Ro.)

Vermont.

A north Atlantic state of the U.S.A., the only one of the six New England states with no sea coast; popularly known as the "Green Mountain state." Area 9,718 sq.mi., of which 440 sq.mi. are water. Pop. (1940) 359,231, later greatly depleted by the exodus of thousands to the armed services and to war industries in other states. In 1940 there were 327,079 native whites, 31,727 foreign-born, 384 Negro, 41 of other races. The two largest cities are Burlington, on Lake Champlain (27,686), and Rutland (17,082). The capital is Montpelier (8,006).

History.—The state legislature convened in 1943 and granted emergency powers to the governor, who in turn created the office of civilian defense and the Council of Safety. There were no changes in the constitution. State officers in 1943: governor, William H. Wills; lieutenant governor, Mortimer R. Proctor; secretary of state, Rawson C. Myrick; state treasurer, Levi R. Kelley.

Education.—Approximately 1,000 elementary schools were in operation during 1943, or 100 less than in the preceding year. The enrolment dropped 4,991, reached 39,104 pupils; number of teachers, 1,814. In the 91 secondary schools of the state there were 14,964 pupils enrolled, a decrease of 1,101 from the preceding year. Teachers in the secondary school numbered 708.

Public Welfare, Charities, Correction.—The Public Welfare department has jurisdiction over all penal institutions in the state, the state hospital for the insane, the tuberculosis sanitariums, the state industrial school. Old-age assistance is set up under a director and a board of three members. The expenditure of this division for the fiscal year ending June 30, 1943, was $1,269,576. Expenditures for the year ending June 30, 1943, were as follows: aid to dependent children $265,458.08, 645 cases, 1,669 children; committed children $143,740.42, 1,022 cases; blind assistance $42,132.50, 150 cases; general relief, not including hospital, burial or overnight transients, $1,074, 2,439 persons; penal institutions $189,980. As of July 1, 1943, there were in the house of correction 64 men; in the state prison 141; in the women's reformatory 25. For the Weeks school for juvenile delinquents, expenditures were $12,256 (pop. 186).

Communication.—Railroad mileage in the state totalled 968.4 in 1943. There were 64,276 telephones in the state. Total number of miles in public highways was 14,204.5, of which 1,780.3 mi. were listed as state highways, 2,744.0 mi. as state-aid highways and 9,680.2 mi. as town highways. Total state expenditure for state highway work for the fiscal year ending June 30, 1943, was $4,300,000.

Banking and Finance.—At the close of the fiscal year, June 30, 1943, there were 57 state and national banks in Vermont, 8 mutual savings banks, 33 savings banks and trust companies, 10 co-operative savings and loan associations and 3 credit unions. There was an increase in bank deposits in 1943 of $10,514,725.63. Total bank deposits $126,157,910. Total number of banks 41.

Receipts of the state as of June 30, 1943 totalled $16,702,157.35; disbursements $15,020,191.67; obligations $5,493,431.90; unappropriated surplus $1,176,664.29.

Agriculture.—The total number of cattle in 1943 was 398,763, of which 264,361 were milk-producing. Wartime restrictions in dairy products impelled the governor to appoint the commissioner of agriculture, E. H. Jones, "milk co-ordinator for the existing emergency" in 1943.

Leading Agricultural Products of Vermont, 1943 and 1942

Crop	1943 (est.)	1942	Crop	1943 (est.)	1942
Corn, bu.	2,508,000	2,800,000	Maple syrup, gal.	1,072,000	1,310,000
Potatoes, bu.	1,846,000	1,473,000	Apples, bu.	705,000	731,000
Oats, bu.	1,440,000	1,961,000	Maple sugar, lb.	354,000	320,000
Tame hay, tons	1,147,000	1,161,000			

Manufacturing.—The number of manufacturing plants in Vermont in 1943 was 850; the number of workers about 110,000, of whom about 50,000 were industrial workers. Total wages paid industrial employees were about $55,000,000. Total value of products produced was estimated at well over $175,000,000. The principal products manufactured are machine tools, woodworking, lumber and furniture, marble, granite, textiles, paper, talc, asbestos, slate, scales and clothing. War manufacturing expanded pay rolls to a considerable extent in 1943.

Mineral Production.—The outstanding event of geological interest in Vermont in 1943 was the development of copper mines, abandoned 40 years previously, in the copper-bearing belt extending north and south over a known distance of approximately 20 mi. The six basic mineral industries of the state, asbestos, granite, limestone, marble, slate and talc, were variously affected by the war. The mining of asbestos was extremely active in 1942–43, as was marble. Slate was at low ebb and most of the quarries were closed. Lime was mined at about 80% of normal, owing to conditions in the paper industry. Talc companies were also operating at about 80% of normal. The critical condition of the rubber industry greatly restricted the use of Vermont talc.

facilities at 93 locations in 45 states and the District of Columbia. There were 61,764 beds for hospital treatment and 18,455 for domiciliary care. In addition, 1,693 hospital beds in other government facilities were being utilized. The hospital load of the Veterans' administration at that time was 56,897 patients, of whom 56,641 were United States veterans, 24 were allied veterans of World War I and 232 were miscellaneous beneficiaries. Of the United States veterans, 54,013 were in Veterans' administration facilities, 1,680 in other government hospitals and 948 in state or civil institutions. Approximately 74.98% of these United States veterans were receiving treatment for disabilities not of service origin. During the fiscal year 1943, 9,835 United States veterans were admitted for observation and treatment of tuberculosis, 9,952 for psychotic or mental diseases, 12,642 for other neurological disorders and 127,805 for general medical and surgical conditions. The veteran population in domiciliary status June 30, 1943, totalled 8,997. Of this number, 5,582 veterans were disabled by general medical conditions, 3,273 by neuropsychiatric diseases and 142 by tubercular ailments. During the fiscal year 1943, an average of 4,898 veterans eligible for care in Veterans' administration facilities were cared for in state or territorial homes. These homes are reimbursed by the federal government at the rate of $240 a year for each of such veterans domiciled therein. During the year, dental care was provided for 31,460 hospital patients, 6,831 domiciliary members and 2,976 outpatients in clinics maintained by the Veterans' administration.

Pensions and Compensation.—Table I shows the number of cases on the rolls as of June 30, 1943, and the net disbursements during the fiscal year 1943 from the appropriations "ARMY AND NAVY PENSIONS."

Vocational Rehabilitation.—Public No. 16, 78th congress, approved March 24, 1941, provided vocational rehabilitation to any person who served in the active military or naval service at any time after Dec. 6, 1941, and prior to the termination of World War II, who (1) was honourably discharged from such service; (2) has a disability incurred in or aggravated by such service for which pension is payable or would be but for the receipt of retirement pay and (3) is in need of vocational rehabilitation to overcome the handicap of such disability. As of June 30, 1943, only a few applications for training had been received.

Guardianship.—The guardianship load of the Veterans' administration, June 30, 1943, was 78,064 wards, of whom 43,172 were incompetents and 34,892 minors. The value of estates of these wards approximated $155,709,290.63.

Insurance.—As of June 30, 1943, there were 586,590 United States government life insurance policies in force representing $2,499,603,842 of insurance. Monthly payments were being made to 10,808 policyholders for permanent and total disabilities. Disbursements for this type of insurance during the fiscal year 1943 totalled $39,814,670.28. On June 30, 1943, monthly payments of yearly renewable term insurance policies were being made to 9,717 permanently and totally disabled veterans and to the beneficiaries of 4,683 deceased veterans. Monthly payments on automatic insurance policies were being made to 224 veterans and the beneficiaries of 19 deceased veterans. Disbursements for term and automatic insurance during the fiscal year totalled $14,489,489.50, including $5,345,996.16 transferred to the U.S. Government Life Insurance Trust fund for cases traceable to hazards of war. As of June 30, 1943, there had been approved 9,565,088 applications for national service life insurance aggregating $66,506,754,500. An act approved Oct. 17, 1940, provided for suspension of enforcement of certain civil liabilities of persons serving in the armed forces of the United States. Article IV of the act provided that the government would, on application by the insured, guarantee to commercial insurance companies premiums on insurance carried with such companies by policyholders while in active service. Through June 30, 1943, 67,054 applications for this benefit had been received, of which 53,080 representing $127,575,186.53 of insurance had been approved.

Finance.—The actual net disbursements from appropriations and trust funds of the Veterans' administration (including adjustments on lapsed appropriations) during the fiscal year 1943 were as shown in Table II. (*See* also REHABILITATION AND OCCUPATIONAL THERAPY FOR WOUNDED SOLDIERS.)

Table II.—*Net Disbursements of Veterans' Administration in Fiscal Year 1943*

Appropriations	Disbursements
Salaries and expenses	$111,401,127.42*
Emergency fund for the president, national defense (allotment to Veterans' administration)	2,968,212.36
Printing and binding	292,792.13
Hospital and domiciliary facilities and services (Veterans' administration)	2,694,330.81
Public Works Administration act of 1938 (allotment to Veterans' administration, 1938–43)	26,158.49
Emergency relief (transfers from WPA), 1941–43	139,811.86
Army and navy pensions	442,373,819.87
Military and naval insurance (World War I)	14,489,489.50§
National service life insurance (World War II)	18,295,029.69†
Adjusted service and dependent pay (World War I)	167,728.48
Vocational rehabilitation (World War I)	—3,452.55
Military and naval family allowance	—2,680.23‡
Miscellaneous	260.35
Trust funds	
U. S. government life insurance fund	39,814,670.28
National service life insurance (World War II)	6,549,351.07
Adjusted service certificates (World War I)	996,953.80
Army allotments	39.00
General post fund	34,156.86
Funds due incompetent beneficiaries	89,187.24
Personal funds of patients, Veterans' administration	3,078,508.21
Total	$643,406,394.64

*Includes adjustments on lapsed appropriations—medical and hospital services, credit of $215.78.

†Represents net amount transferred by vouchers to national service life insurance trust fund for payment of claims traceable to the extra hazards of military or naval service. Does not include $12,840,767.15 transferred by transfer appropriation warrants from July 1 through Aug. 31, 1942.

‡Credits to appropriations.

§Includes $5,345,996.16 transferred to U. S. government life insurance trust fund for hazardous cases.

Note: "Salaries and expenses," "Public Works administration" and "emergency relief" include net disbursements of $633,879.08 from allotments made to other government agencies. Allotments were made to the war department and Federal Works agency.

(F. T. Hr.)

Veterans of Foreign Wars.

Adoption of a nationwide program of war service and the formulation of a 10-point postwar veteran welfare program comprised a major share of the activities of the Veterans of Foreign Wars of the United States during the year 1942–43.

Based on resolutions adopted by the various V.F.W. state conventions early in the summer of 1943—resolutions which later were endorsed by the 44th V.F.W. national encampment at New York city—the V.F.W. outlined the following comprehensive program:

(1) Continuation of pay, within certain limits, for a period of six months after honourable discharge at the close of World War II, for all persons serving in the armed forces of the United States, based on a minimum of $100 a month.
(2) Educational aid by the federal government to honourably discharged veterans of the war whose educations were interrupted or prevented by military or naval service.
(3) Adequate Veterans' administration hospital facilities for medical treatment and hospitalization of honourably discharged veterans of any recognized war, campaign or expedition, with at least 90 days' service.
(4) Pension and compensation payments to be established and maintained on a fair and reasonable cost of living index.
(5) Effective, workable veteran preference in employment on federal, state, county and municipal jobs.
(6) All supply and construction contracts between the federal government and private firms or contractors to contain a clause that 3 employees of every 10 or major portion thereof, of said private firms or contractors, shall be honourably discharged veterans.
(7) Pension entitlement to widows and orphans of honourably discharged, deceased veterans of any recognized war, campaign or expedition, where said veteran had at least 90 days' service, regardless of service-connected disabilities.
(8) Pension entitlement to honourably discharged veterans of any war, campaign or expedition who had at least 90 days' service and who are (a) unemployable, (b) unable to secure gainful and sustaining employment and (c) disabled to a degree of 10% or more, regardless of service connection of said disability.
(9) Special recognition for honourably discharged veterans of any recognized war, campaign or expedition, who served on foreign soil or had sea duty in hostile waters, by a special allowance of 20% above standard rates for compensation, pension and retirement pay and a five-point addition above standard additions in veteran preference on classified civil service examination grades.
(10) Continuation and expansion of the Veterans' administration as an independent federal agency with full jurisdiction over vocational rehabilitation for service-connected disabled veterans; medical treatment, hospitalization, pensions and compensation for all eligible veterans and continuation and expansion of the Veterans' Employment service to render special assistance to all honourably discharged veterans in need of or seeking employment.

More than 150,000 veterans or men still in the armed forces of World War II joined the V.F.W. during the fiscal year ended Aug. 31, 1943, marking the greatest year of expansion the organization had experienced since its founding in 1899.

The constitution and by-laws provide that V.F.W. eligibility to membership is earned by armed service, in time of war "on foreign soil or in hostile waters." Thus, immediately upon the United States' declaration of war upon Japan and Germany, thousands of members of the U.S. army, navy and marine corps became eligible to V.F.W. membership as soon as they had left the continental limits of the United States. Many of these World War II members became affiliated, for the duration of the war, with V.F.W. "field units" established on 65 battle fronts throughout the world in 1943.

CREW OF THE "MEMPHIS BELLE," famous U.S. bomber which completed its 25th mission over Europe in 1943, being inducted into the Veterans of Foreign Wars at Detroit, Mich.

Others, including many who had received medical discharges, became active members of the 3,600 local V.F.W. posts throughout the country.

The V.F.W.'s 44th year also was distinguished by record-breaking achievements in other activities. The 22nd annual Buddy poppy distribution, in behalf of disabled veterans and their dependents, reached an all-time high in the sale of 9,253,275 poppies throughout the country. The V.F.W. aviation cadet recruiting program, undertaken at the request of the war department, resulted in a total of 45,000 young men being qualified for training in the army air forces, and an additional 37,000 for other branches of the armed forces.

Attainment of several long-standing legislative objectives also marked the 1942–43 year, notably in the enactment of *H.R. 1749*, the broadest bill on veterans' hospitalization ever passed by congress. *H.R. 1749*, which became Public Law No. 10, granted to veterans of World War II the same hospitalization, domiciliary care and burial benefits already available to veterans of previous wars. Another accomplished objective was enactment of Public Law No. 16, which completely separated disabled war veterans from disabled civilians as to vocational rehabilitation. There were in 1943 more than 2,500 ladies' auxiliary chapters.

"Unity for Peace" was the keynote of the 1943 national encampment, Sept. 28–30, 1943, at New York, at which Carl J. Schoeninger, electrical engineer of Detroit, Mich., was elected commander-in-chief. (B. Y.)

Veterinary Medicine. A noteworthy trend in the application of veterinary science was its upward turn in the face of decreasing animal transportation in the military service. In the civilian circles of Great Britain and the United States, the expansion was due to increasing the number of food-producing animals and to more alert attention to mastering the diseases which reduce food poundage. In the military forces, there was extension of meat and milk inspection in home and far-flung theatres where trained veterinary officers, under the direction of medical corps, not only supervised the safety of army rations but also superintended the health of the domestic animals surrounding military stations. The American pattern of food inspection, enforced by the surgeon general of the United States army, attracted wide attention among the forces of the United Nations operating in Iceland, the near east, and Australia where the civilian veterinary services and agricultural interests willingly co-operated with veterinary officers in eradicating transmissible diseases from the farm animals concerned.

Veterinary War Conference.—The American Veterinary Medical association convened a session at St. Louis in August to study the more important animal-disease problems of war in the western hemisphere. Officially appointed delegates from Canada and Mexico participated. The object was to fortify disease-control measures among farm animals and to recommend practical means of nourishing them regardless of declining sources of adequate proteins. The government's plan of merely stepping up the number of animals without corresponding plans of providing the essentials of normal nutrition and housing was frowned upon.

The War-Dog Service.—The war-dog service organized in the army of the United States in 1942 was enlarged to many thousands of dogs. Elaborate training stations and numerous dog trainers and veterinary officers were provided to develop the project. The dogs were donated by the citizenry under the sponsorship of Dogs for Defense, Inc., a private nonprofit corporation of New York. Trained dogs of selected breeds were assigned in large numbers to armed forces in field and factory. They served as sentries, patrols, and transport animals, in the latter role as

sledge dogs in northern army posts. The yeoman service rendered by trained dogs since ancient times was thereby redemonstrated in the global war of 1943.

Veterinary Education.—World War II exposed the shortcomings of the veterinary educational system of Great Britain and the United States. Left to private enterprise, unmanaged through lack of public interest and support until recent years, the adequacy, cleanliness and wholesomeness of food derived from animals received little consideration as populations increased and civilization developed. Sufficient manpower had not been furnished to supervise the safety of the food man eats, granted that this is one of the purposes of veterinary science. The legislature of New York published a book drawing attention to the filthy, insanitary abattoirs of that state; the Chicago *Herald-American* published a series of illustrated articles depicting a similar situation in Illinois. The United States public health service established its "standard milk ordinance" where there is no supervision of the cows whence the milk comes. The Illinois legislature passed a law to curb the incidence of bovine brucellosis and undulant fever (human) but the state veterinarian did not have sufficient veterinary personnel to enforce it. Meanwhile the American veterinary schools turned away hundreds of applicants for veterinary degrees without taking steps to broaden the fields in which trained veterinarians should be working.

The Sulfonamides in Veterinary Medicine.—Although sulfanilamide and the allied compounds proved useful in acute streptococcal infections of animals, the response of chronic infections to their action was practically nil. Chronic mastitis, chronic endometritis, brucellosis, actinomycosis, and the pasterelloses were not perceptibly improved by the use of these drugs. On the other hand, the salmonelloses affecting the digestive tract were recognizably improved by the slow absorbing group, of which sulfaguanidine is an example. The use of sulfapyridine in acute pulmonary infections of animals was disappointing.

Trichomoniasis of Cattle.—Increasing importance was placed in the role played by *Trichomonas foetus* in interrupting reproduction in cattle. Improved methods of diagnosing this widespread venereal disease of cattle were developed by scientists of the University of Wisconsin. Attempts by the zoological division of the United States bureau of animal industry to immunize cows against the disease failed.

Hog-Cholera Vaccination.—The swine population of the United States was increased from the ten-year average of 55,000,000 head to 125,000,000 in 1943. The increment was made possible by the extensive use of anti-hog-cholera serum and virus, the production of which was the largest of record. The use of crystal-violet vaccine (attenuated virus) in lieu of serum-virus vaccination gained ground during the year but represented but a small percentage of total hogs vaccinated against cholera.

Rabbit Production.—The raising of rabbits in the United States and Great Britain, for food and fur, was increased in 1942 and 1943, together with scientific research into the nature of their ailments. The potentiality of the "backyard rabbitry" as a source of delectable food was never before realized in these two countries. The fish and wildlife service of the United States and the ministry of agriculture and fisheries of Britain furnished useful information on the husbandry of domestic rabbits and the handling of their common maladies. Light was shed on coccidiosis, spirochetosis, ecto- and endoparasites, mucoid enteritis, and the inevitable accidents of reproduction. That the domestic rabbit is not the victim of tularemia (although not exempt to experimental inoculations) was emphasized.

Meat-Inspection Service Removed from the Bureau of Animal Industry.—Federal meat inspection established in 1890 and improved by congress in 1906 which was always directed by the chief of the bureau of animal industry, United States department of agriculture, and manned by veterinarians of civil service classification was transferred to the Food Distribution administration, that is, from scientific to commercial command. The transfer aroused nation-wide protests mainly on the ground of excellent record and the sense of security the American people had always felt under the former direction. The protests came from stockmen, expert hygienists and veterinarians. Unaware of the object of such changes the public showed meagre interest in the transfer.

Relocation of Veterinarians.—The Procurement and Assignment Service recommended voluntary relocation of veterinarians not engaged in essential practice or positions. That is, doctors of veterinary medicine engaged exclusively in pet-animal practice or nonessential commercial pursuits should relocate in rural districts densely populated with food-producing animals in order to be deferred from military service. Veterinarians in the civilian service, federal or state, or engaged in practice among farm animals were given preferential rating by local draft boards. Students taking the pre-veterinary course or the curriculum leading to the degree of doctor of veterinary medicine in a recognized college were given preferential rating provided their individual effort so justified.

(L. A. M.)

Vichy. A town of central France, department of Allier, located on the right bank of the Allier river, 33 mi. southeast of Moulins; pop. (1939) 20,000. The town first came into political prominence when it was selected in 1940 as the seat of the French government, formed after the loss of the war to Germany and headed by Marshal Henri Philippe Pétain (*q.v.*) as chief of state. The town was convenient as a temporary seat of administration because of the number of hotels and sanitariums which could be converted to use as government offices. What was originally conceived as a makeshift arrangement of short duration still continued at the end of 1943, because no definitive peace treaty had been signed between Germany and France.

Victoria. A state of the Australian commonwealth, area 87,844 sq.mi.; pop. (est. Dec. 31, 1941), 1,952,152. Chief cities (pop. Dec. 31, 1940): Melbourne (cap. 1,076,700); Geelong (40,100); Ballarat (38,590); Bendigo (30,150). Governor: Maj. Gen. Sir W. J. Dugan.

History.—The Country party government under the leadership of Albert Dunstan completed eight years of office in April and was returned to power at the general elections in June. The net result of the elections was that the United Australia party—supporting the government—lost 3 seats, 1 each to the Country party and Labour party and 1 to the Independents. In September, however, the government was defeated on a vote of no confidence in connection with the redistribution of parliamentary seats. A Labour government was sworn in on Sept. 14, but resigned less than 48 hours later, on the refusal of the governor to grant a dissolution. The governor thereupon commissioned Albert Dunstan to form a coalition government with T. T. Holloway, the leader of the United Australia party.

The state budget which was introduced in August revealed a surplus of £A.755,000 for 1942–43 and provided for an es-

timated surplus of £A.56,000 during the current fiscal year. Features of the budget were increases in expenditure on education (£A.211,000), hospitals (£A.216,000) and a £A.100,000 fund for the encouragement of secondary industries in rural areas.

Education.—In 1939: state primary schools 2,585; scholars on roll 221,219; average attendance 155,441. State secondary schools 154; scholars on roll 42,104; average attendance 34,176.

Finance.—In 1942–43 (estimated) revenue £A.32,541,000; expenditure £A.32,456,000; debt outstanding (June 30, 1942) £A. 177,716,484.

Communications.—Roads and streets (1940) 103,929 mi. Railways (1941–42) 4,764 mi. Motor vehicles licensed (March 31, 1943); cars, trucks, etc., 214,888; cycles 15,996. Wireless receiving set licences (March 31, 1943) 387,667. Telephones (June 30, 1941) 228,936.

Agriculture, Manufactures, Mineral Production.—Production in 1942–43: wheat 42,000,000 bu.; wool (1940–41) 185,000,000 lb.; coal, brown (1940) 3,994,515 tons; gold (1939) 156,522 fine ounces. Industry and labour, 1941–42: factories 8,916; employees 257,369; gross value of output £A.256,112,647; unemployment (trade union returns) (March 1943), 0.8%.

Vidal y Barraquer, Francis of Assisi (1868–1943), Spanish cardinal, was born Oct. 3 in Cambrils. He entered the priesthood in 1899, was appointed successively bishop of Pentacomia, 1913, apostolic administrator of Solsona, 1914, archbishop of Tarragona, 1919 and cardinal, 1921. Politically an anti-falangist, he refused to endorse the pastoral letter which gave its blessing to the Franco cause during the early days of the Spanish Civil War and was obliged to leave the country for his own safety. Italian consular officials helped him escape and he found haven in Italy. Cardinal Vidal died while on a visit to Fribourg, Switzerland, according to a news report from that city, Sept. 14.

Vinson, Frederick Moore (1890–), U.S. politician, was born Jan. 22 at Louisa, Ky. He was graduated from Kentucky Normal college, 1908, received his B.A., 1909, and his law degree, 1911, from Centre college and practised law in Louisa in 1911. He was commonwealth attorney of the 32nd judicial district of Kentucky, 1921–24, and served seven terms in the national house of representatives. A key man in congress during the early days of the Roosevelt administration, Vinson helped formulate revenue legislation as a member of the house ways and means committee. His record was strongly prolabour, he voted for legislation approving establishment of the NLRB and was instrumental in putting through congress the bill on the undistributed profits tax. In 1937, he accepted President Roosevelt's offer of the post of associate justice in the U.S. court of appeals for the District of Columbia and assumed his new duties in May 1938. Vinson was named director of the Office of Economic Stabilization in May 1943. The following month, he vetoed the 8-cent per hour increase asked for by 1,100,000 nonoperating employees of the railroad brotherhoods. On Nov. 16, 1943, Vinson warned that the "little steel" wage formula would be destroyed if the 8-cent increase was approved by congress.

Virginia. Southernmost of the middle Atlantic states, the "Old Dominion" was one of the 13 original United States. Area 40,815 sq.mi., including 916 sq.mi. of water. Pop. (1940) 2,677,773, 35.3% urban and 64.7% rural. The civilian population was estimated in April, 1943 at 2,883,945. An estimate by the population study of the state planning board showed a civilian white population of 2,250,345, nonwhite of 633,600. Capital, Richmond (193,042 in 1940 and 231,000 in April 1943). Other cities include Norfolk (144,332 and 205,946), Roanoke (69,287 and 64,866), and Portsmouth (50,745 and 64,996).

History.—The state's shipyard industry soared in 1943, and the population of Newport News increased from 35,000 to more than 55,000. Shipyard workers numbered close to 30,000, of whom 1,600 were women. War brought a marked redistribution of the state's population, as the rapid expansion of industrial localities sucked labour from farm areas. There was no session in 1943 of the general assembly, which meets biennially in even-numbered years, although interim commissions were active in such fields as small-loan legislation, co-operatives, medical licensing requirements and public health. The state department of corrections, which was established in 1942, ended its first year of operation with 501 prisoners on parole and 600 on probation. A general election in Nov. 1943 resulted in 15 new members in the state senate and 35 new members in the house of delegates. The governor (elected in Nov. 1941) was Colgate W. Darden, Jr.; William M. Tuck was lieutenant governor.

Education.—In 1942–43, elementary school enrolment was 428,466, teaching staff 12,165; secondary school enrolment 128,244, teaching staff 5,924.

Public Welfare, Charities, Correction.—For the year ended June 30, 1943, 12,480 persons received $858,296.70 in general relief; 21,892 persons received $2,403,285.85 in old-age assistance; 6,153 families with 17,693 dependent children, $1,168,404.25; 1,208 blind, $167,930.68; and in 1943 (January through November) 70,421 unemployment compensation checks were written for $829,538.59. This represented only 25% of the number and amount of unemployment checks in the same period of 1942. An average daily population of 4,000 were in five penal institutions for adults, and 717 were in four industrial schools for juveniles at the end of the fiscal year in June 1943.

Communication.—On Jan. 1, 1942, there were 9,607.6 mi. of highway in the state's primary system; on July 1, 1943, there were 37,675 mi. in the secondary system. During the year ended June 30, 1943, the state spent $23,528,097.17 on the highways. Railroad mileage in Virginia was 4,203.2 on Jan. 1, 1943. There were 327,842 telephones in Virginia on Nov. 30, 1943.

Banking and Finance.—On Oct. 18, 1943, Virginia had 184 state banks with 63 branches and five "facilities," and 130 national banks and branches. On Oct. 18, 1943, deposits in state banks totalled $506,034,477 and assets $551,892,354. On June 30, 1943, deposits of national banks were $725,971,000, and assets $784,935,000. Resources on Dec. 31, 1942, of 19 industrial loan associations were $6,793,864; of 58 building and loan associations, $34,937,414; of 32 credit unions, $1,524,093. The state budget for the fiscal year ended June 30, 1943, showed receipts of $147,572,307, some 12% above the previous year, and expenditures of $126,820,685, 11% above the previous year. The gross debt on June 30 was $18,599,351; there was no net debt, since a sinking fund of $19,252,294 left an excess of $692,942. The fiscal year ended with a surplus of $21,699,419.

Agriculture.—The value of Virginia's principal crops in 1943 was estimated at $205,000,000, an increase of 16% over 1942. Acreage harvested advanced 1% above the 1942 figure to 3,905,000 ac. A shortage of farm labour and a prolonged drought combined to reduce the volume of 11 of the 13 principal crops. The farm income in 1943 was estimated at more than 37% higher than in 1942, when the income was $222,106,000.

Manufacturing.—The total value of manufactured products for the year ending Sept. 30, 1942, was $1,755,767,694. Wage

Table I.—*Leading Agricultural Products of Virginia, 1943 and 1942*

Crop	1943 (est.)	1942
Tobacco, lb.	106,878,000	104,150,000
Cotton, lint, bales	25,000	34,000
Corn, bu.	33,275,000	35,586,000
Oats, bu.	2,860,000	3,510,000
Barley, bu.	1,575,000	2,120,000
Apples, commercial, bu.	5,220,000	14,094,000
Peaches, bu.	172,000	1,936,000
Wheat, winter, bu.	5,863,000	7,520,000
Hay, all tame, tons	1,420,000	1,498,000
Lespedeza seed, lb.	5,000,000	9,200,000
Potatoes, bu.	9,594,000	7,242,000
Sweet potatoes, bu.	2,976,000	3,875,000
Peanuts for nuts, lb.	193,875,000	175,950,000
Soybeans for beans, bu.	1,050,000	1,782,000

Table II.—*Principal Industries of Virginia, 1942 and 1941 (Oct. 1-Sept. 30)*

Industry	Value of Products	
	Oct. 1, 1940-Sept. 30, 1941	Oct. 1, 1941-Sept. 30, 1942
Tobacco products	$528,130,587	$424,198,041
Food and kindred products	187,787,084	135,308,438
Textiles and their products	254,302,193	179,711,490
Wood products	112,912,574	79,869,851
Paper and printing	124,993,180	96,024,436
Chemical products	144,828,853	73,131,229
Metals and machinery	61,391,282	38,787,922
Transportation equipment	276,730,874	183,784,622

earners were paid $272,512,356 in this period, while total salaries amounted to $54,535,281; an estimated 234,130 persons were engaged in manufacturing at the end of this period. The principal industries were tobacco products, food and kindred products, transportation equipment, textiles, paper and printing and chemical products.

Mineral Production.—Production of coal in the year ended Sept. 30, 1942, was valued at $38,494,104, up 30% from the previous year; coke was valued at $1,884,051, up 50%; stone and slate, $6,391,841; and sand and gravel, $1,551,441. Progress was made in the development of magnesium and mica mines in several localities. (J. S. Br.)

Virginia, University of. A state institution for higher education at Charlottesville, Va. The original university was designed and built by Thomas Jefferson. There are six departments: two academic—the college and department of graduate studies; and four professional—law, medicine, engineering and education. The total budget for 1943–44 was $3,052,850. The corporate name of the university is "The Rector and Visitors of the University of Virginia." For statistics of student enrolment, faculty members, endowment, library volumes, etc., *see* Universities and Colleges. (J. L. N.)

Virgin Islands. A United States dependency in the West Indies, east of Puerto Rico, comprising St. Croix (pop. 12,902), St. Thomas (11,265) and St. John (722) islands. Area, 133 sq.mi.; pop. (1940) 24,889, 13.1% more than in 1930, with whites 9%, Negroes 69% (1930: 78.3%), "mixed and other races" 22% (1930: 12½%). The chief cities are: Charlotte Amalie, the capital, on St. Thomas, 9,801 (1930: 7,036); Christiansted, 4,495 (1930: 3,767) and Frederiksted, 2,498 (1930: 2,698) on St. Croix. The governor in 1943 was Charles Harwood.

History.—The Virgin Islands during 1943 generally felt the pressure of wartime dislocations and shipping restrictions. Supplies of food to the islands were largely effected through the Food Distribution administration. Food shortages, however, had been overcome by the end of 1943. In order to avoid unemployment after the completion of defense construction, Governor Harwood proposed an extensive public works plan involving a water storage project in St. Croix, water supply facilities in St. Thomas, and highway construction generally in the islands.

Education.—Public and private elementary and secondary schools had an enrolment in June 1943 of 2,813. Charlotte Amalie high school had 498 students.

Finance.—The monetary unit is the United States dollar. A United States government subsidy of $159,800 was required to defray the expenses of St. Croix. However, the islands of St. Thomas and St. John operated without a federal deficit appropriation for the second successive year.

Trade.—Under wartime conditions in 1943 official policy was to withhold full trade statistics. A general retrogression from the 1942 high was felt in the Virgin Islands as a result of shipping restrictions and the completion of defense installations. Production and sale of both rum and sugar, however, rose considerably during 1943.

Communication.—External communication is by steamer and Pan American Airways, through Charlotte Amalie. Inter-island traffic is by boat. Radio-telephone service was established with the United States during 1943.

Agriculture.—Agriculture supplements shipping to support St. Thomas. St. Croix and St. John are largely agricultural. In 1940 (census) there were 828 "farms" of 3 ac. or more, totalling 55,228 ac. St. Croix produced practically the entire sugar crop of the islands, which amounted to 2,250 tons in 1943—a 150% increase over 1942. Grazing was encouraged by a government-built abattoir on St. Croix and a cold storage market on St. Thomas. Vegetables, orchard products (guava, cacao, coco-nuts, limes, lemons and oranges), and livestock comprised the principal agricultural products other than sugar. (C. L. G.)

Vital Statistics: *see* Birth Statistics; Census, 1940; Death Statistics; Infant Mortality; Marriage and Divorce; Suicide Statistics.

Vitamins. Food shortages and rationing along with educational work by numerous agencies made people more food conscious. Unfortunately exaggerated claims and implications concerning the widespread prevalence of malnutrition, especially of various vitamin deficiencies, were enthusiastically used to bombard the public with misleading advertising concerning the need and value of vitamin preparations. Good nutrition is a prerequisite for good health, but vitamins are only part of nutrition. Good nutrition comes from consuming a variety of wholesome food, not from a poor diet supplemented with costly vitamin preparations.

Many reports showed that the seeds of cereal grains, which are low in ascorbic acid, can develop significant amounts of this vitamin by sprouting. The use of bean sprouts by the Chinese is well known, and studies have shown that the field soybean not only acquires improved dietary qualities by sprouting, but it is more readily cooked and useful as food for man. Burkholder summarized a study of the vitamins of the B complex before and after germination of oats, wheat, barley and corn. This shows that germination results in a marked increase in riboflavin and niacin; the thiamin content was not changed appreciably. The possibilities of making the best use of the available cereal foods still remained to be explored.

Dehydrated foods have obvious advantages when it comes to transporting large quantities of food a considerable distance. It is not a simple problem to dehydrate food products so that upon rehydration they will possess a reasonable degree of original appearance, taste and nutritive value. As ascorbic acid is readily destroyed by oxidation, and vitamin A is also susceptible to this process, it is likely that these nutrients are diminished in most dehydrated products. Numerous investigations have shown that the ascorbic acid content of dehydrated products is practically

zero and that vitamin A is appreciably decreased. As we depend heavily on vegetables as a source of vitamin A, in the form of carotene, means of stabilizing this nutrient in the dehydration process were under intensive investigation.

Several studies on the relation of vitamin intake to physical fatigue due to hard muscular work were made. Such studies were of direct importance to the war, both with regard to the armed forces and civilian workers. It was shown that excessive amounts of the various vitamins are of no advantage in combating fatigue, but insufficient amounts of the vitamin B complex will cause earlier fatigue and a falling off in physical efficiency. Barborka, Foltz and Ivy reported the results of study on four well trained young men which confirmed the latter observation. They concluded that vitamin B complex added to a vitamin B complex inadequate diet restores work output to efficient levels. It was generally believed that thiamin is probably the principal "B vitamin" concerned with fatigue, yet Keys and co-workers in studies on normal young men reported that at a low level of thiamin, 0.23 mg. per 1,000 calories, muscular and metabolic functions were in no way limited. Hard physical work, particularly in warm climates, is accompanied by considerable perspiration, and since sweat is an aqueous medium, it is important to know whether significant amounts of the water soluble vitamins are lost by this means.

The best evidence available suggested that only small amounts of vitamins are lost in sweat, and that water and salt are the only practical losses which require attention.

Certain vitamins are synthesized by the intestinal bacteria. These microorganisms are thus of considerable importance to the nutrition of animals and of human beings because the vitamins synthesized are available to the host. Vitamin K is produced by bacteria in the intestinal tract in sufficient quantities to meet the normal needs of man and most animals. Biotin, one of the vitamins of the B complex, is provided to man in larger quantities by intestinal bacteria than by the diet. Man may not develop deficiencies of biotin, pantothenic acid, pyridoxine, folic acid, and most likely certain other essential nutrients because these substances are made for him by microorganisms in the intestinal tract. But should the intestinal flora be altered, as by the administration of drugs, radical changes in the diet, or by diseases of the gastrointestinal tract, diseases primarily nutritional in aetiology may result.

One of the vitamins mentioned in the preceding paragraph, folic acid, which is required by the rat only when the bacterial flora is interfered with, as by the feeding of sulfaguanidine, was shown to be required in the diet of the chick and the monkey. A deficiency in the chick leads to lack of growth, poor feathering and anaemia, while monkeys show an anaemia and a severe leukopenia (decrease in the number of white blood cells below the normal range). Hogan and collaborators summarized the work on this vitamin in the chick, and also reported the preparation of this compound in pure form. Its chemical formula was not reported in 1943.

The investigations on folic acid in the nutrition of monkeys was done principally by Waisman and Elvehjem.

The role that various vitamins, and other nutrients, might have in resistance to infection has long given rise to much speculation. There was no evidence in 1943 that amounts of any nutrient above such levels as are necessary for good nutrition will give increased resistance to disease, though there was abundant evidence that good nutrition is a requisite for a maximum degree of resistance. Trager made the interesting observation that one of the vitamins, biotin, may play a specific role in resistance to malaria. The observations on this finding were limited to experiments on ducks and chicks and whether they would be of practical significance to man was not known in 1943. Biotin deficiency in man under natural conditions was unknown; however, in countries where malaria is endemic, it is more severe in times of famine.

For some years enzyme chemists have developed a concept that substances possessing a chemical structure similar to the active or "prosthetic" group of the enzyme may compete with the active group for adsorption on the surface of the same protein, thereby interfering with the formation of the enzyme and hence decreasing enzyme activity. This interesting concept was applied in various vitamin researches. Thus thiopanic acid which is similar in structure to the vitamin pantothenic acid prevents growth of certain microorganisms. In animals, the administration of dicoumarin or salicylic acid, presumably because of their chemical relationship to vitamin K, produces hypoprothrombinemia. In each case a competitive action between the vitamin and the inhibitory substance was demonstrated. Woolley and White demonstrated the production of thiamin deficiency in mice by the administration of a pyridine analogue of thiamin, pyrithiamin, and Woolley and Krampitz described a condition in mice and rats similar to scurvy which was produced by feeding a compound structurally related to ascorbic acid. The use of these "anti-vitamins" or vitamin-inhibitors opened up a new field of vitamin research, and a field which ultimately might yield much of practical importance to the study of disease.

While the essential amino acids are not classed as vitamins, they are for all practical purposes similar to vitamins in that they are substances required by the body and which must be obtained ready-made, either from food or perhaps from synthesis by intestinal bacteria. Rose was investigating the amino acid requirements of man and found that nitrogen equilibrium might be maintained in young adults for periods of two weeks on a diet in which the only source of protein was eight pure amino acids.

These investigations are fundamental to a better understanding of human nutrition.

For those interested in comprehensively following progress in vitamin research and other phases of the science of nutrition, attention should be called to a series of excellent review articles which appeared in the *Journal of the American Medical Association* and were to be published in book form under the title of *Handbook of Nutrition*, and also to the publication by the Nutrition foundation of a new type of journal called *Nutrition Reviews*. This is a monthly publication which undertakes to provide an authoritative, unbiased review of the world's current research progress in nutrition.

Voroshilov, Klementiy E. (1881–), Russian army officer, was born Feb. 4 in Verkhnyi, Ukraine. In 1903 he joined the Social-Democratic party. He was exiled to Archangel in 1907 for revolutionary activities but escaped to Baku. During World War I he was a revolutionary organizer, but after the bolsheviks seized power he entered active military life. He led guerrilla detachments against German armies in the Ukraine in 1918. He was people's commissar of the army and navy in 1925 and was a member of the Communist party central committee after 1921. On May 8, 1940, Voroshilov was named vice-premier and Marshal Timoshenko succeeded him as defense commissar. In Aug. 1941 Marshal Voroshilov was in command of the northwestern front which included Leningrad, and in Oct. 1941 he was charged with formation of new Russian armies. He was then returned to the Leningrad area and was one of the commanders there when the siege was broken in Jan. 1943. He attended the Churchill-Stalin conference in Moscow in Aug. 1942 and the Molotov-Eden-Hull conference in the same city in Oct. 1943.

Wages and Hours. During 1943, as well as 1942, employment and pay rolls in manufacturing and non-manufacturing industries improved substantially as a result of World War II orders and the U.S. war program as well as foreign orders. Both hourly wages and weekly earnings increased markedly. The acceleration of work within plants, caused by the adoption of three shifts and large overtime bonuses increased total pay rolls and gave workers throughout many industries much higher weekly earnings. Practically all industries engaged in war production or affected by war orders reported a high percentage of overtime.

Table I shows the employment indexes for 1942 and the first nine months of 1943 in all manufactures, and for durable goods and nondurable goods groups, by months. These indexes were arrived at by the use of 1939 as the base.

Table II shows the average hours and earnings in the two sample months of Jan. and July, 1943, in the principal manufacturing and nonmanufacturing industries. Table II shows clearly the high level of wage-earners' weekly "take-home" in 1943, through the combination of high rates and long hours.

Table III shows a steady rise in average hourly earnings from 1939 to 1943. The increase is greater than the rise in hourly rates since a steadily increasing amount of time-and-one-half and double-time overtime rates appreciably increased hourly average earnings. There was no way of separating the increment added to hourly earnings by overtime work from the prevailing rates paid for standard hours of employment.

The bureau of labour statistics figures showed a downward trend of hours in most industries from 1937 to 1939 because of reduction in hours-standards effected by union agreements. But in 1941 to 1943 average hours increased, particularly in the heavy industries, because so much overtime was worked as a result of the war.

The much higher hourly earnings in some industries are due to one or more of the following factors: (1) character of the labour supply employed, as to sex, age and skill, (2) productivity of the industry, principally determined by its degree of modernization, technical equipment and proportion of skilled workers, (3) degree to which union working conditions prevail, (4) necessity of paying high wages to attract labour supply.

Weekly earnings are really of greater significance than hourly rates, from the point of view of living standards. There were 23 industries of the 31 studied in which average weekly earnings exceeded $30 per week in July 1943, and the maximum was $57.18 in the automobile industries. The lowest weekly earnings were in hotels: $20.18. In July 1943, there were 16 industries in which average weekly earnings exceeded $30 and six where they exceeded $40 per week. Four of these were: $57.18 in the automobile industry; $55.93 in transportation equipment; $51.08 in machinery; and $47.97 in construction. The lowest, hotels, were but $20.18. The average weekly earnings of durable goods manufacturers were $48.76 in July 1943 compared with $44.62 a year earlier and $31.24 in 1941.

Four industries fell between $20 and $25 per week and four between $25 and $30; none below $20 in July 1942.

The wages of farm labour were higher in 1943 than in 1942, judging by the reports of the U.S. bureau of agricultural economics; both monthly and daily wages. (*See* also AGRICULTURE; BUSINESS REVIEW; CANADA; CENSUS, 1940; LAW.)

(D. D. L.)

Great Britain.—The most recent official statistics of wages in Great Britain referred to Jan. 1943. At that date, weekly *rates* of wages, as distinct from earnings, had risen on the average by 26% to 27% above the level prevailing in Oct. 1938, the date used by the government as a basis for prewar conditions.

Earnings had naturally increased a good deal faster than rates of wages, owing both to the spread of systems of payment by results and the intensification of output and to the working of longer hours, including large amounts of overtime and week-end work. As against this, the proportion of women employed was higher than before the war; and the lower earnings of the women had a tendency to depress the general average. Over all the industries covered by the return gross earnings (before deduction of income tax or insurance contributions) were higher by about 65% in Jan. 1943 than in Oct. 1938. For adult men only, the increase was a little under 65%. For women, it was 80%, the figure being considerably affected by the payment of the men's rates to women directly replacing male workers on jobs normally done by men. For boys and youths under 21 the average increase was nearly 73%; and it has to be borne in mind that the average age in this group was lower than it was before the war, owing to the extensive calling up of youths of 18 and upwards. For girls under 18 the average rise was 73.4%. Average earnings in 1938 and 1943 respectively were, for men 69/- and 113/9*d.*, for women 32/6*d.* and 58/6*d.*, for boys and youths 26/1*d.* and 45/1*d.*, and for girls 18/6*d.* and 32/1*d.* The increases within these averages varied considerably for different trades, being naturally highest in the metal and engineering trades. The lowest increases were in the public utility services and in the printing and paper trades. In the building trades there was a tendency for earnings to fall, after sharp increases up to 1942. This reversal of the previous tendency was due mainly to restrictions on uneconomic overtime and week-end work since the completion of the main war-time program of factory and aerodrome construction. In particular, the very high earnings which were accruing to boys and youths in the building and constructional trades had for the most part ceased.

The returns summarized in the preceding paragraph cover rather over 6,000,000 workers, mainly in factory and other constructional trades. They do not include miners or transport workers or workers in the clerical and distributive trades. Probably the inclusion of the excluded groups would not greatly affect the general averages. For coal miners, earnings per shift are known to have increased by about 65% between the first quarter of 1939 and the first quarter of 1943. Agricultural workers (adult males) in 1943 had a national minimum rate of 60/- a week, and women of 45/-. Earnings in the public services rose substantially less than the average, and earnings on the railways probably at about the average rate.

These changes in money wages have to be compared with an official figure of 28% for the rise in the cost of living between 1938 and 1943. This official figure, however, understated the actual increase, owing to the very sharp rise in the cost of semi-luxuries not included in the index (tobacco, beer, all kinds of personal goods not subject to rationing, furniture, and so on). The official figure was kept down by the fact that all the main elements in the cost of living that were being held down by government subsidies were included in it. The effect of this system, and of the methods of rationing applied, was to keep nutrition at a satisfactory standard for most of the population; but there were serious declines of quality in clothing, especially boots, and in standards of housing, partly owing to blitz damage, but still more because of the cessation of building and the concentration of population in certain areas in which great industrial developments occurred.

Wages were still settled in the main by collective bargaining between trade unions and employers' associations, with reference to arbitration, either by the wartime National Arbitration Tribunal or by *ad hoc* bodies, where agreement was not reached. Wages in 1943 were fairly stable, with only a small upward tendency. Strikes, though much noticed in the press, were few and small, and turned mainly on local grievances or on questions arising out of the interpretation of national arbitration awards. The time lost by stoppages of work was very small, despite a good many protests against the refusal to grant increases, especially to skilled timeworkers whose earnings lagged behind those of pieceworkers doing less skilled work.

Hours of labour in general remained unaltered, with some tendency to reduce the excessive amounts of overtime and Sunday work previously enforced. The working of very long hours by juveniles between 16 and 18 was largely checked, especially in the constructional trades. Average hours of work were still considerably in excess of prewar hours; but the strain was partly relieved by some improvement in conditions of travel to and from work. The movement for holidays with pay was further extended, the most important recent agreement covering the workers in the building and civil engineering industries.

In connection with all figures of wages and earnings it should of course be borne in mind that direct taxation had by this time been extended to cover the main body of adult wage-earners. The system of collection on the basis of the year's earnings, having given rise to many difficulties, was being superseded for most manual workers by a "pay-as-you-earn" method. It was estimated (Oxford University Institute of Statistics *Bulletin*, June 1943) that in 1942 wages took 42% of the national income, as against 39% in 1938 (or 46% as against 40% if military pay is included with wages). (*See* LABOUR UNIONS; PRICES.)

Wallace, Henry Agard (1888–), vice-president of the United States. (See *Encyclopædia Britannica.*) Wallace was secretary of agriculture in the cabinet of Franklin D. Roosevelt from March 4, 1933, until Sept. 5, 1940, when he resigned to campaign for the vice-presidency, to which he was elected the following Nov. 5.

In the summer of 1941 he became an important figure in the U.S. defense program. President Roosevelt appointed him head of the Economic Defense board (later the Board of Economic Warfare) on July 31 and chairman of the Supply Priorities and Allocations board on Aug. 28. In Dec. 1942 a dispute between Wallace and Jesse Jones, chairman of the Reconstruction Finance corporation, from which the BEW obtained funds to purchase war materials abroad, was first made public in testimony before a

senate committee. The quarrel came to a head on June 29, 1943, when Wallace accused Jones of obstructing the war effort by hampering the BEW in its efforts to secure vital materials from foreign sources. On July 15 President Roosevelt abolished the BEW and transferred all subsidiaries of the RFC engaged in financing foreign purchases to a new Office of Economic Warfare (later the Foreign Economic administration). Early in 1943 Wallace made a good will tour to seven South American countries, where he addressed several national congresses. His book *The Century of the Common Man,* containing many of his principal speeches and writings, appeared in July 1943.

Waller, Thomas W. ("FATS"), (1904?–1943), U.S. musician and composer, was the son of a Negro pastor and grandson of a noted Negro violinist. As a child, he studied the bass viol, violin and piano. In 1924, he published his first song, "Squeeze Me." In 1925 he launched his own band, which became popular with the start of the swing music era. From night clubs and cabarets he went to the radio, produced records and appeared in the movies. He composed part of the score for the musical comedy *Keep Shufflin',* 1927, the music for *Ain't Misbehavin',* 1928 and *Honeysuckle Rose,* 1928. He also wrote the score for *Early to Bed,* a Broadway hit in 1943, and was the composer of some 400 songs. He was taken ill on a train bound for Kansas City and was found dead in his berth, Dec. 15.

War Boards, British-U.S.: *see* BRITISH-U.S. WAR BOARDS.

War Bonds. Unprecedented sums were sought from the American people by their government for support of the U.S. war effort in the Second and Third War Loans of 1943. But neither sum—$13,000,000,000 in the Second loan, $15,000,000,000 in the Third—was an adequate measure of the public's loan-subscribing willingness and capacity. Against the goal of $13,000,000,000, the Second loan produced $18,600,000,000. For the Third loan, the goal was raised to $15,000,000,000, and the country's voluntary response was $18,900,000,000. As a collateral result of the combined total of $9,500,000,000 in oversubscriptions, Secretary of the Treasury Henry Morgenthau, Jr., was enabled to postpone the Fourth War Loan until 1944.

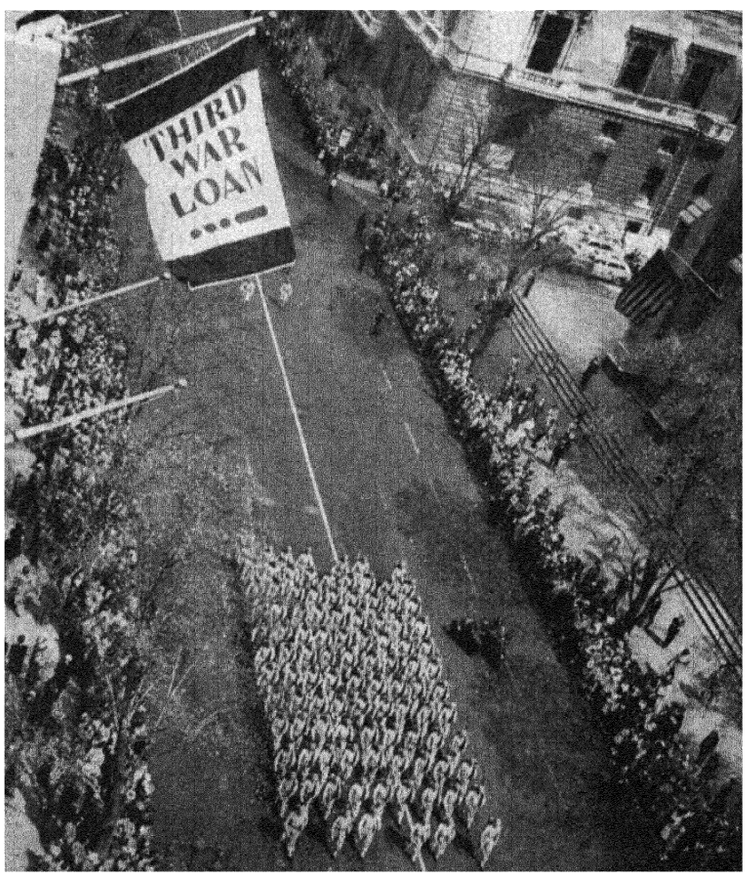
The Second War Loan was launched April 12 and completed May 1. The Third loan began Sept. 9 and continued through Oct. 2. The $37,500,000,000 thus raised by the government in six weeks compared with $21,000,000,000 raised by five drives in a total of 18 weeks for World War I, 1917–19.

Commercial banks provided not a penny of the Third loan's $18,900,000,000 yield, and only $5,000,000,000 of the Second loan. The importance, as an anti-inflation safeguard, of the sale of securities to nonbanking investors and particularly to individuals was stressed by the treasury in both loans.

Sales of Series E, F and G war bonds to the extent of $5,400,000,000 were included in the Second and Third loan totals. In the first 11 months of 1943 there were additional Series E, F and G sales of $7,500,000,000, through operation of the pay roll savings plan and other month-to-month treasury war bond promotions.

Second War Loan, Third War Loan and regular war bond sales therefore amounted in 1943 to a grand total of $45,000,000,000, not counting war bond sales for the month of December. Participation by commercial banks in the Second loan was limited by the treasury to approximately $5,000,000,000; the banks actually oversubscribed this share several times. In a financing operation supplementary to the Third War Loan, but conducted separately, the treasury made a limited offering of marketable securities to commercial banks, and announced cash sale allotments totalling $3,200,000,000 upon subscriptions totalling $10,900,000,000. For the entire calendar year net absorption of government securities by commercial banks and federal reserve banks amounted to approximately $24,000,000,000, and net absorption by all others, excluding special issues to trust funds, etc., amounted to approximately $30,000,000,000.

The extent to which various categories of nonbanking subscribers participated in the Second and Third loans is shown in the table:



Nonbanking Subscriptions to Second and Third U.S. War Loans, 1943
(millions of dollars)

Class of Investor	Second War Loan	Third War Loan
Individuals, partnerships and personal trust accounts	$3,200	$5,377
Insurance companies	2,408	2,620
Mutual savings banks	1,195	1,508
State and local governments	503	795
Dealers and brokers	544	894
Other corporations and associations	5,145	7,120
U.S. government agencies and trust funds	391	630

The types of securities offered were essentially the same for the two loans. Combined sales to nonbanking investors for both loans were, in rounded figures: Series E savings bonds, $3,900,000,000; Series F and G savings bonds together, $1,500,000,000; Series C savings notes (formerly tax notes), $4,100,000,000; 2½% long term bonds (1964–69 maturities), $7,500,000,000; 2% medium term bonds (1950–52 and 1951–53 maturities), $8,100,000,000; ⅞% treasury certificates of indebtedness (one year), $7,200,000,000.

Second War Loan sales to commercial banks were: 2% bonds, $2,100,000,000; ⅞% certificates, $2,100,000,000; treasury 90-day bills, $810,000,000.

Of the three savings bonds, commonly referred to as war bonds, the Series E "people's bond" continued to lead heavily in sales, with a total of $9,600,000,000 for the first 11 months

A MILITARY PARADE on Fifth avenue, New York city, signalized the opening of the third U.S. war loan drive Sept. 9, 1943

of 1943. Nearly 53,000,000 units of these bonds were sold in the Third loan. Bonds of the $25 denomination accounted for approximately a third of all Series E sales.

Redemptions of savings bonds during the first 11 months of 1943 were: Series E, $1,194,000,000; Series F, $30,000,000; Series G, $79,000,000. Amounts of each series outstanding as of November 30 were: Series E, $15,404,673,000; Series F, $1,548,705,000; Series G, $6,128,924,000.

In each bond-selling campaign the treasury had the aid of millions of volunteer salesmen and saleswomen. Sales organizations functioned by federal reserve districts for the Second War Loan, as they had for the First or Victory Fund drive in Dec. 1942. In preparation for the Third War Loan, Secretary Morgenthau announced the "streamlining" of the sales forces on a state basis, with the chairmen of state war finance committees reporting to the secretary through the national director of the treasury's war finance division. Within the states, the former volunteer Victory Fund committees and the treasury's war savings staffs were combined, and state chairmen and their associates took charge of local war finance committees formed along city and county lines. It was estimated that by the end of the year, war bonds had been sold to more than 50,000,000 persons.

Under Secretary of the Treasury D. W. Bell announced in Dec. 1943 that the war had been financed at an average rate of slightly less than 1¾%, compared with an average rate of about 4¼% on the securities issued to finance World War I. (*See* also BANKING; NATIONAL DEBT.) (F. SM.)

War Communications, Board of.

During 1943 the Board of War Communications (created by executive order Sept. 1940 as the Defense Communications board) issued 18 orders designed to co-ordinate, strengthen and speed essential wartime communications in the U.S. Priority systems were inaugurated for telephone, teletypewriter and telegraph messages important to the war effort. The need for flexible, efficient systems of radiotelegraph communications to theatres of Allied military operations in North Africa and elsewhere occupied considerable attention of the board. Effective May 1943, American international wire or radio carriers had to obtain board approval before opening negotiations with any foreign administration regarding new communications circuits from the United States.

James Lawrence Fly, chairman of the Federal Communications commission, continued as chairman of the board in 1943. Other members were Major General Harry C. Ingles, chief signal officer of the army; Rear Admiral Joseph R. Redman, director of naval communications; Hon. Breckinridge Long, assistant secretary of state; and Hon. Herbert E. Gaston, assistant secretary of the treasury and BWC secretary. The board had no paid personnel or appropriations. It operated through a co-ordinating committee and a law committee staffed by personnel from the five agencies represented on the BWC. A number of committees, made up of industry, government and labour representatives, experts in all fields of wire and radio communications, served the board as advisers. (*See* also FEDERAL COMMUNICATIONS COMMISSION; RADIO.) (J. L. FY.)

War Crimes.

United Nations Commission for the Investigation of War Crimes. This commission held its first meeting on Oct. 20, 1943. Its creation was a result of the Inter-Allied declaration signed at St. James's palace, London, on

"WRITTEN IN BLOOD." The indelibility of German war crimes as seen by Angelo of the *Philadelphia Inquirer*

Jan. 13, 1942, by representatives of the governments of Belgium, Czechoslovakia, Greece, Luxembourg, the Netherlands, Norway, Poland and Yugoslavia and of the Free French National committee, after a conference in which representatives of Australia, Canada, China, Great Britain, India, New Zealand, South Africa, the United States, and the U.S.S.R. participated as guests. Previously, on Oct. 25, 1941, President Roosevelt and Prime Minister Churchill had issued simultaneous statements calling for retribution against the perpetrators of war crimes. The declaration was followed by a series of collective notes and memoranda of evidence presented to the governments of Great Britain, the United States and the U.S.S.R. by the signatories.

On Aug. 21 and Oct. 7, 1942, President Roosevelt again publicly declared the intention of the United States "that just and sure punishment shall be meted out" to those responsible for organized atrocities, and stated that the American government was prepared to co-operate in establishing the commission. On Oct. 7 also, the lord chancellor (Viscount Simon) reiterated in the house of lords the same intention on the part of the British government, and emphasized that technical aspects such as gathering evidence, reviewing applicable rules of law, etc., were not being neglected. Associated with the commission, which had offices in London, in 1943, were representatives appointed by the United Nations, to assist in its work of investigation, research and the collection of the information on which action against individual war criminals can be based. Herbert C. Pell, former Ambassador to Portugal and Hungary, was the United States representative. Sir Cecil Hurst represented Great Britain. Due to technical questions which had not yet been settled, the U.S.S.R. was not represented on the commission, but had already given notice of her intention to prosecute war criminals by calling for the trial of Hess and actually trying and executing several persons found guilty of war crimes in portions of Russia liberated from the Germans. At the Moscow conference, a statement was issued on Nov. 1, 1943 signed by President Roosevelt, Prime Minister Churchill and Premier Stalin, "speaking in the interests of the 33 United Nations," solemnly declaring that at the time of the granting of any armistice, German officers and men and members of the nazi party responsible for or having taken a consenting part in atroci-

ties, would be sent back to the countries where the crimes were committed, to be judged and punished by the laws of these countries, and that lists would be compiled "in all possible detail." In addition, German criminals "whose offenses have no particular geographical localization" would be punished by joint decision of the governments of the Allies, a point designed to prevent the escape of political offenders through legal loop-holes.

War Department, U.S.: *see* GOVERNMENT DEPARTMENTS AND BUREAUS.

Warfare, Incendiary. For the intensive bombing of Berlin in Nov. and Dec. 1943, a greater weight of incendiary bombs than of explosive bombs was dropped. The effects produced by incendiaries also were greater. Some neutral observers reported that as high as 90% of the devastation of Berlin, caused by RAF and AAF bombing late in 1943, resulted from incendiary damage.

Incendiary damage from air attack was caused almost entirely by specially designed incendiary bombs; the fires caused by explosive bombs were insignificant when compared to the staggering values in real property in all theatres of operation that were destroyed by incendiaries.

A liquid and three solids were the principal incendiaries used: oil; and white phosphorus, magnesium and thermit.

With any one of these four incendiary agents employed in an aerial bomb, the technical objective was simply to place fire, burning at sufficiently high temperature, against a burnable target; and to maintain this intense heat sufficiently long to induce combustion. For a point target of high inflammability, a single fire thus induced was usually sufficient to destroy the structure. Where area bombing was undertaken, the tactical objective was to generate an appropriate number of separate fires, sufficiently close together so that they would coalesce into a general conflagration before they could be extinguished.

The ultimate objective of incendiary attack—that is, the generation of a conflagration—was attained with greater frequency in 1943 than in any previous year. On numerous occasions bombers returning to renew attack of an area target reported fires still burning several days after previous attacks.

Increasing altitudes from which aerial attacks were launched, necessitated use of bombs of larger size, because even in area bombing operations the small magnesium incendiary bomb weighing approximately 2 lb. gave excessive dispersion in falling 20,000 or more feet. Another objection to scattering large quantities of small bombs was the increasing number of bombers simultaneously present over a target area.

Thus tactical considerations were more important than technical factors; the placing of incendiary bombs successfully at the target in step with the increasing tempo of aerial attack was of primary concern.

In planning incendiary attacks, thought was still given to the quality and extent of fire-fighting organization within the target area, although passive defense against incendiary warfare became less and less effective as intensity of bombing operations increased. Three factors were seen to hamper fire fighting, or the efforts of the defender to nullify the destructive effectiveness of incendiary bombs:

a. The sheer weight of explosive bombs dropped toppled buildings and impeded access to fires, disrupted water supplies and demoralized fire fighters.
b. Extensive use of delay action (explosive) bombs had the result of prolonging attacks long after bombers had returned to their bases, and thus further interfering with fire control measures.
c. Follow-up aerial attacks were timed to cause fire fighters to take cover while fires were still blazing.

The antipersonnel incendiary bomb which was first used extensively in 1942, assumed less importance in 1943, partially because of developments in strategy of air attack. Increased intensity of attacks and the frequency with which metropolitan targets, particularly in the European theatre, were bombed combined to render the explosive feature of incendiary bombs less significant.

Renewed interest was noted in white phosphorus as an incendiary agent. Military advances made by the United Nations during 1943 placed under Allied control the principal global resources for producing this incendiary. Although not as effective a fire kindler as magnesium, white phosphorus is a powerful antipersonnel agent, since it usually scatters in showers of burning particles which imbed in flesh and cause painful burns. During 1943 white phosphorus was widely used, both in aerial bombs and in shell, for its combined casualty and incendiary effect.

The flame thrower also was brought from military obscurity to considerable prominence during 1943. The flame thrower proved valuable in attacking bunkers and pillboxes having narrow and usually camouflaged firing apertures.

Improvements in the flame thrower noted in 1943 were: *a.* extended range of the fire jet (to over 50 yd.), and *b.* use of solid fuels which cling to and burn on the target. The latter tended to enhance the incendiary value of the flame thrower, although the primary tactical use of this weapon was still antipersonnel rather than antimatériel.

Although the possibility of incendiary attack of communities of the United States mainland diminished during 1943 because of curtailment of axis air power, at the same time the vulnerability of American cities to fire from the air was noted and some long range planning was proposed, particularly by the National Fire

Protection association, to diminish this risk. (G. J. B. F.)

War Food Administration. The work of the War Food administration in 1943 was designed to help farmers produce the largest possible supply of food; to allocate the food in a way that would be most effective in prosecuting the war; and to help processors, handlers and consumers distribute the civilian supply of food as evenly and fairly as possible. Farmers wrote an astounding record of production in 1943. (*See* AGRICULTURE.)

In making the plans for the production of 1943, farmers were assisted by goals placed before them by the Agricultural Adjustment agency's farmer committeemen. They also were assisted in making plans of needed war crops by support prices which gave assurance as to the return that could be counted on for each pound or bushel or bale of output. Support prices are the equivalent for farmers of the contract prices to producers of other war materials such as guns, ships, tanks, clothing, etc.

After the farm plans were made early, attention was turned to one of the great problems of the year—shortage of experienced labour. The number of people working on farms at the beginning of 1943 was the lowest on record. Yet with more food and fibre produced than ever before, there were no significant losses of farm production that could be attributed to labour shortage. The farm people were chiefly responsible for this accomplishment. Reports show that during the summer of 1943 farmers increased their working hours even above the long hours they worked in 1942. Also, an estimated 400,000 year-round farm workers who otherwise would have entered the armed services were kept on the farms during 1943 by deferments granted by selective service boards under the so-called Tydings amendment.

However, the farm families and their regular help could not do the whole job. It was necessary to provide a great deal of volunteer help from towns and cities. This work was administered by agencies of the War Food administration. Starting in May 1943, about 4,000,000 placements of workers were made under this program. This involved 1,500,000 different workers. In addition, more than 65,000 Mexicans, Jamaicans and Bahamians were imported by the War Food administration for work on American farms. Twenty thousand United States farm workers were transported from their home states to other states at the expense of the government, and 27,000 farm workers were transported from one place to another within their home states. Even so, the United States achieved its record 1943 production with nearly 4,000,000 fewer people on farms than in World War I.

Some pinches in supply of machinery were inevitable during 1943, when the unparalleled munitions program was using up metals and other critical materials and necessarily had first call on them. Realizing that more machinery had to be made available in 1944, the War Food administration by July 1, 1943, had successfully presented to the War Production board the next year's requirements, and the WPB had authorized the manufacture of 80% of as much new machinery as was manufactured in 1940.

Fertilizers (except nitrogen, which was needed for explosives) were supplied above prewar levels, while adequate insecticides and fungicides were available to protect commercial crops and victory gardens. They were distributed equitably to meet the crop needs in various areas.

The record food output created a serious problem of transportation in 1943. However, the railroads, the water-borne carriers, the War Shipping administration, and other agencies co-operated with WFA, and this problem was solved. In 1943, one-fifth more cars of grain and grain products were moved than in 1942; one-eighth more carloads of livestock were moved; grain imports from Canada were many times greater.

To get the huge crop and livestock output processed required co-operation of WFA with the food-processing industries in presenting their case for machinery. Consultations were held with food industries and machine manufacturers. Schedules of production and minimum needs for new equipment were drawn up, and WPB released the necessary materials. As a result, the food-processing industries handled 49% more meat in 1943 than in the average prewar year; 63% more chickens; 50% more egg products; 14% more dairy products; 29% more fats and oils; and 63% more canned vegetables.

This great output of raw and processed foods was allocated by WFA in 1943 as follows: 75% for civilians, 13% for United States military services, 12% for U.S. allies and other friendly nations.

Food distribution orders were the means of implementing this allocation, and 919 orders were issued during 1943, covering nearly every important phase of food distribution. Some of the orders enforced economies in processing and distribution to keep down the cost, save manpower, materials and transportation. Some held back supplies for the military services. Some allocated scarce foods for better distribution. Each order was for a specific need and was withdrawn when its purpose had been served.

The War Food administration worked closely with the armed services in co-ordinating all government buying of food in 1943. Through the establishment of an Inter-Agency Food Procurement committee, supplies were provided at the right time at the right place in the right amounts. The food buying program was operated in substantial part by the War Food administration. More than 80 food industry advisory committees helped with the procurement and processing machinery and various other problems involved.

Local civilian shortages of some foods developed during 1943, particularly in congested areas. In several congested areas WFA helped establish or expand feeding facilities in industrial plants and to improve the meals served to industrial workers. In other areas, where temporary local surpluses developed, foods were purchased to support producer prices; new markets or processing outlets were found; warehouse accommodations were obtained, or programs were developed to stimulate the sales of these foods at the times when heaviest supplies arrived on the market. Spoilage of food was kept at a minimum. (M. Js.)

War Frauds: *see* FEDERAL BUREAU OF INVESTIGATION.

War Information, Office of. The Office of War Information, under the terms of executive orders of June 13, 1942, and March 9, 1943, was authorized "to formulate and carry out . . . information activities designed to facilitate the development of an informed and intelligent understanding, at home and abroad, of the status and progress of the war effort and of the war policies, activities and aims of the government."

The overseas branch was organized to disseminate information to allied, neutral and occupied nations throughout the world and, in conjunction with the military establishment, direct propaganda warfare against enemy countries. Operations of the overseas branch in 1943 included radio broadcasting on a 24-hour schedule in virtually every language to every nation in the world, the distribution of news, pamphlets and leaflets, motion pictures, magazines, photographs and other information materials both from the continental United States and from outposts at strategic points throughout the world. The domestic branch directed and co-ordinated the release of all government information about home front

PROPAGANDA BOOKLET for small children issued by the Office of War Information in several languages in 1943. Specimen pages, left to right, show pictures of a U.S. tank crew member (Africaans or Boer language: "This is a soldier in the American army . . ."); a marine (Spanish: "This is one of the [North] American marines . . .") and a U.S. star (French: "This is the star symbolizing liberty.")

activities to the press, radio and other media of public information.

Elmer Davis, former news analyst of the Columbia Broadcasting system, was named director of OWI in June, 1942. Robert Sherwood, newspaperman and playwright, was named director of the overseas branch. Palmer Hoyt, publisher of the *Portland-Oregonian,* became director of the domestic branch in June, 1943.

(G. A. Bs.)

War Labor Board, National.

During 1943 government stabilization controls, though threatened by powerful groups seeking increased prices and wages, held in check the forces of inflation.

The wage regulations of the economic stabilization program were administered by the National War Labor board. In addition, the board was responsible for settlement of wartime labour disputes.

The wage stabilization powers of the board were defined by the Anti-Inflation act of Oct. 1942, and by subsequent orders from the president and the director of economic stabilization. The WLB wage program provided first, a limitation upon changes in the general level of wages, by application of the "little steel" formula, and second, a basis for allowing increases in rates to correct inter-plant and intra-plant wage relationships, substandard wages and obsolete wage structures which hindered the flow of manpower to critical war industries.

Gross average weekly and hourly earnings of factory workers continued to rise significantly in 1943. However, a considerable proportion of the rise was attributable to lengthening of the work week in meeting production schedules, with resulting overtime pay; to the effect of higher wages in war industries, and to upgrading from lower-paid to higher-paid jobs.

These factors, which increased the earnings of manufacturing workers, were an inevitable consequence of stepped-up war production. They were not subject to the control of the War Labor board, which sought to regulate only basic wage rates and to permit shift differentials, incentive plans, promotions and reclassifications, and certain other wage components which did not affect basic rates. A measure of the effect of board action on wages was provided by a comparison of the increase in gross earnings and in basic rates. Of the 10.2-cent gain in gross average hourly factory earnings in the first year of wage stabilization, 1.1 cents was attributable to increases ordered or approved by the board for basic wage rates.

A dramatic illustration of increased earnings without an increase of wage rates was provided by the agreement between the secretary of the interior and the United Mine Workers in the bituminous coal case. The original demand of the United Mine Workers was for an increase of $2 a day for no more work. The contract that was finally approved allowed $1.50 a day for one hour more work under the old wage scales, plus a small weekly adjustment for travel time after 40 hours. Wage rates were not increased but hours were added to the week, thus increasing the miners' earnings and also stepping up vitally needed coal production.

The second major function of the War Labor board was the peaceful settlement of labour disputes. Right after Pearl Harbor labour and industry pledged no strikes or lock-outs for the duration and agreed that a National War Labor board should be set up to settle all disputes. Executive order 9017 officially established the board and defined its powers. The War Labor Disputes act of June 1943, gave the board additional authority to order the terms and conditions governing the relations between the parties and subpoena witnesses or documents. Executive order 9370 provided penalties for noncompliance with directive orders of the board.

On the whole, the no-strike pledge was observed. The bulk of the strikes in 1943 were wildcat stoppages unauthorized by national union officials. Of the 13,500,000 man-days lost in 1943, 8,500,000, or 63%, were due to the four major coal strikes. While the number of strikes in wartime was higher than in years before the war, they were shorter and the number of people involved was smaller than in peacetime disputes.

One of the most frequent issues in dispute was the open shop-closed shop controversy.

The board largely resolved this issue with the maintenance of membership formula.

On the basis of its experience during 1943 in administering the voluntary maintenance of membership provision, the board, in Nov. 1943, adopted a standardized procedure. This included a simple explanation of maintenance of membership to be posted in plants, a revised form of union security order, and a procedure for administering the maintenance of membership provision.

The work load of the War Labor board in both stabilization cases and disputes increased sharply during 1943. From Jan. through Dec. 1943, the board and its agencies turned out final rulings in 122,000 voluntary applications for pay adjustments, involving over 6,000,000 employees.

During the same period the board decided more than 3,900 labour dispute cases involving more than 3,500,000 workers. (*See* also LAW; NATIONAL LABOR RELATIONS BOARD; STRIKES AND LOCK-OUTS.)

(W. H. Ds.)

War Manpower Commission. Despite the vast authority vested in the War Manpower commission and the broad scope of its control, the shortage of labour in the United States reached an acute stage in 1943 and at the year's end continued to be one of the nation's most serious unsolved problems. Heavy demands for workers to meet the increasingly heavy schedules of war production and the severe drain on the labour force by the monthly Selective Service calls aggravated an already critical situation in the labour market. Existing manpower was being depleted by inductions into the armed forces at a rate that would soon exhaust the available supply. With nearly every draftable single man or "post-Pearl Harbor" father scheduled for military service, the drafting of "pre-Pearl Harbor" fathers was ordered in October.

This precipitated a climax in the long public controversy over the drafting of fathers, and congress in Dec. 1943, by legislative action, withdrew the Selective Service system from the authority of the WMC. However, the immediate effect of this legislation was negligible, inasmuch as the Selective Service director, on instructions from the president, continued to operate closely with the WMC on matters of policy.

Coincidental with the extension of the draft, a renewed campaign was instituted to recruit a million more women, chiefly housewives, for war-useful jobs and to transfer more workers from less essential activities. In July 1943, out of a total of 63,600,000 persons either at work or in the armed forces, 17,200,000 were women. This was the largest number of United States workers ever employed at one time and also by far the largest number of women engaged either in the armed forces or in gainful occupations.

In an effort to overcome the manpower crisis, stringent regulations were enforced on an ever-widening scale. Critical shortages of labour developed in many parts of the United States—much more severe in some areas than in others. To meet this situation, a policy of employment stabilization had been adopted whereby areas were classified under various headings. The aim was to reduce turnover and the unnecessary migration of workers and to direct the flow of scarce labour where it was most needed. All hiring was channelled through the United States Employment service and certain other recognized placement agencies. Special emphasis was placed on the need of organizing community action to improve housing and transportation conditions.

In Group I were placed areas of acute labour shortage. Group II embraced areas wherein a labour shortage could be anticipated within six months. By WPB directive, procurement agencies were restricted in awarding contracts in these areas. Group III included areas in which a general labour shortage was foreseeable after six months, and Group IV consisted of areas of adequate labour supply. By Dec. 1943, more than 70 areas were classified in Group I. In this category a minimum 48-hour week became mandatory in November.

To aid employers in achieving the most productive use of labour, a bureau of manpower utilization was established in February, with technically-equipped consultants to make plant surveys, but only at request of employers. These surveys were credited with accomplishing concrete savings in manpower. Nevertheless, labour turnover remained excessively high in 1943, separations averaging 8.2% a month throughout the nation and in some areas as high as 29% and 39%. On the Pacific coast, where a large proportion of vital aircraft manufacture and shipbuilding was concentrated, the labour situation was such as to require special attention of the WMC. Wage differentials and labour-hoarding were among the conditions causing trouble. On Sept. 15, the Office of War Mobilization announced the so-called West Coast plan, which provided for area production committees and labour practice committees to determine which establishments had first claim on available manpower. Indications were that the basic pattern thus established would be adopted by other labour shortage areas.

Employment stabilization standards were revised, effective Oct. 15, by the so-called "job freezing" regulation. Under this order no worker engaged in an essential or locally-needed activity could be hired by another employer unless such hiring aided the prosecution of the war and no worker could be hired for work in a critical occupation except through referral by the USES. Along with this program was issued a list of critical occupations and activities and also an expanded non-deferrable list.

The WMC in 1943 continued under the chairmanship of Paul V. McNutt, federal security administrator. It included representatives of the war, navy, agriculture and labour departments and various government agencies. (*See* also BUSINESS REVIEW; SELECTIVE SERVICE, U.S.; WAR PRODUCTION, U.S.).

(C. A. SR.)

War Medicine: *see* MEDICINE; PSYCHIATRY; SURGERY.

War Mobilization, Office of. To develop wartime policies and programs and unify activities on the home front, President Roosevelt, in an order dated May 27, 1943, created the Office of War Mobilization, with James F. Byrnes, former associate justice of the United States supreme court, as director. The executive order set up a committee of war mobilization with the director as chairman. Other members in 1943 were: Secretary of War Henry L. Stimson, Secretary of Navy Frank Knox, Fred M. Vinson, Director of Economic Stabilization, WPB Chairman Donald M. Nelson, and Harry L. Hopkins, chairman of the Munitions Assignments board. Marvin Jones, who became War Food administrator June 30, was later added to the committee.

Director Byrnes was vested with tremendous authority (*a*) to develop unified programs for the maximum use of the nation's natural and industrial resources, manpower not in the armed forces, and the stabilization of civilian economy; (*b*) to unify the activities of federal agencies concerned with the production and distribution of military and civilian supplies, and (*c*) to issue necessary directives to federal agencies.

As a climax to the disagreement between Vice-President Henry A. Wallace and Secretary of Commerce Jesse H. Jones, the president on July 15 assigned to OWM the task of co-ordinating the policies and programs of the agencies engaged in foreign economic affairs. The controversy between Wallace and Jones was but one of several public airings of differences between government officials. In settling this dispute, the president directed heads of agencies to submit controversies to him or Director Byrnes. If disputes were aired in public, the president called on the agency heads involved to submit their resignations at the same time they issued a statement to the press.

At the suggestion of Director Byrnes, the war department, the navy department and the War Shipping administration set up committees to screen their respective programs. The Office of War Mobilization is represented on these committees. As a result of re-examination of war programs and realigning them with changing war needs, there have been cutbacks totalling $16,000,000,000.

On June 9, 1943, Director Byrnes announced the appointment to the OWM of Bernard M. Baruch "without title or salary." On Nov. 6, 1943, Director Byrnes set up within OWM a new unit headed by Baruch and John Hancock to deal with war and postwar adjustment problems and to develop unified demobilization policies and programs.

REASONS FOR ABSENTEEISM being checked by special telephone operators at a U.S. aircraft plant in 1943

War Production, U.S.

In 1943, U.S. war production reached a peak, and many of the raw-materials bottlenecks which had developed in 1942 were broken.

By the end of 1943 plane production reached the goal set by President Roosevelt shortly after Pearl Harbor—more than 8,800 a month. The 86,000 planes delivered in 1943 represent a phenomenal increase over the 6,000 delivered in 1940, the 20,000 in 1941 and the 48,000 in 1942.

In the first six months of 1943 more merchant vessels were delivered than in all of 1942. Month after month thereafter the total climbed, until in December the rate of merchant ship construction was many times higher than the rate of sinkings. In the second half of 1940, only 33 merchant ships slid down American ways. In 1941 the total was 103; in 1942 it reached 727; and the estimated total for 1943 was about 1,750.

Between Jan. and July 1943 100 warships came off the ways, and shortly after the middle of the year Secretary of the Navy Frank Knox estimated that by the end of 1943 the U.S. naval fleet would be double its size at the beginning of the year.

Production of ground ordnance and signal equipment continued to exceed all previous records. Average monthly production in 1943 was about 14 times that of 1941.

Increases in war production were paralleled by increases in war expenditures. The average daily rate of war expenditures, which had jumped from $81,200,000 to $235,600,000 in 1942, progressed from $240,500,000 in Jan. 1943 to $299,800,000 in November.

The immediate task of the War Production board (*q.v.*) after its establishment Jan. 16, 1942, was threefold: (1) to convert the huge U.S. industrial plant from the production of pleasure cars, metal kitchen items and other peacetime goods to the production of goods needed for war; (2) to expand industrial facilities; (3) to increase the supply of raw materials.

By the autumn of 1942, the rapid, straight-line production techniques of the automobile, refrigerator, vacuum cleaner, radio and other consumer durable-goods industries were being applied to the manufacture of guns and tanks, ships and planes. The production of hundreds of other everyday articles had practically been stopped by orders prohibiting the use of copper, steel and other scarce materials, and the manufacturers of these articles had gone into war work. In 1943 conversion was no longer a major problem.

By Jan. 1943, America's government-financed war plant was 61% completed. The industrial facilities program—including construction, machinery and equipment—which had been put in place by the end of 1942 reached a total of approximately $12,294,000,000 and was expected to reach $17,564,000,000 by the end of 1943. Throughout 1943 the rate of facilities construction moved along a planned decline, with the result that more and more of the nation's resources could be thrown into direct production of munitions.

By July 1943 the facilities program was more than 80% completed. At the year's end, except for certain special programs and some special machinery, the United States had all the machine tools and the capital equipment it needed to produce everything necessary to defeat the enemy.

Materials.—A continuing problem after U.S. entry into World War II was that of providing sufficient raw materials. Domestic production of materials had to be increased, available foreign sources had to be developed and strict economy had to be practised in the use of all materials, so that the goals for the production of finished war goods could be met. Though many difficulties remained to be surmounted at the end of 1943, great strides had been made in increasing the materials supply, and many obstacles that had seemed insurmountable in 1942 were hurdled in 1943. For a discussion of critical materials, *see* STRATEGIC MINERAL SUPPLIES; METALLURGY; BUSINESS REVIEW; also the individual articles on metals and minerals important to U.S. war production in 1943, especially ALUMINUM; CHROMITE; COPPER; IRON AND STEEL; MAGNESIUM; MOLYBDENUM; NICKEL; TIN; TUNGSTEN; VANADIUM; and ZINC. *See* also PAPER AND PULP INDUSTRY; PETROLEUM; RUBBER.

Scheduling and Adjusting Production.—To insure a measured, steady flow of raw materials to war plants, WPB devised the controlled materials plan, announced in Nov. 1942 and placed in operation in April 1943. Under this plan, WPB in 1943 divided the available controlled materials—copper, steel and aluminum, in specified forms and shapes—among the "claimant agencies," such as the army, navy, maritime commission and others, charged with procuring the essential military and civilian needs of the United States and the other United Nations. Each claimant agency, in turn, adjusted its program to fit its share of materials and divided it among the manufacturers, who fabricated it into finished products according to prearranged time schedules.

But the plan, though it solved the biggest, if not the toughest, problem of scheduled production—that of material shortages—did not ensure that all the necessary parts, particularly the critical ones, with wide uses in war production, would be available for fabrication into a plane or tank or essential civilian item at the time and place required. For lack of enough bearings, a fan or a compressor, a vital war machine might not be assembled according to schedule.

Scheduling production of hard-to-get parts, or "critical components," as they were commonly called, was WPB's biggest production job in 1943. It was accomplished by means of scheduling procedures established in a general scheduling order issued in February. The order required manufacturers to indicate realistic delivery dates for parts in insufficient supply and assured that

the plants best able to produce particular types of critical parts would produce those parts and leave production of other types to other plants.

These procedures were similar to the scheduling devices of the controlled materials plan, except that specified critical components, instead of raw materials, were channelled to the war plants. The measure of their success was clearly indicated by the steadily rising curve of war output.

Over-all scheduling of production, of major importance from the first, in 1943 became more necessary than ever. Scheduling became the keynote of efficiency, and the only way the United States could produce what was demanded, and in the proper proportions, was to make increasingly better use of plants, materials and manpower already employed in war production.

The slack experienced in 1942 had been pretty well taken up by the end of 1943. Manpower was particularly short. Millions of additional workers were needed to produce aircraft, ships, munitions and other war equipment in accordance with the goals set for 1944.

It was a fairly simple matter, in the beginning, to transfer resources from nonessential to essential uses. By the end of 1943 a more difficult choice—between essential and more essential uses—had to be made. Increasing the production of one weapon of war may mean reducing the output of another.

Adjustments in the production machine had to be more exact than ever before. Because the raw materials used in one type of product were more urgently needed for another type of product, plants in many cases had to be shifted from one type of production to another. When the immediate requirements for one kind of war goods were met, production of those goods was often discontinued or reduced temporarily.

A considerable amount of reconversion had already been effected in 1943. One plant, built to make recoil mechanisms for cannon, was changed over to make struts for aircraft landing gear. Another plant, constructed to make tank armour, shifted to production of engine cylinders. Certain ammunition plants began producing aircraft engine parts and accessories. Other plants, built for the production of aircraft engine accessories, were producing small arms for the army.

Besides adjustments such as these, other adjustments were needed in 1943 to mesh the U.S. war production program into the production programs of the other United Nations, in accordance with over-all military requirements. Co-ordination and integration on an international basis were effected through the Combined Production and Resources board and the Combined Raw Materials board, made up of representatives from the United Kingdom, Canada and the United States, working in close collaboration with the combined chiefs of staff.

The combined boards in 1943 surveyed the over-all demands of the United Nations in relation to the available supply of critical materials and products, such as rubber, coal, steel, copper, hides and leather, wheeled vehicles, internal combustion engines and others. Their recommendations for combined action, designed to achieve maximum utilization of available resources as well as the most economical use of shipping facilities, were then passed on to the production agencies of the nations involved.

For example, a recommendation of the combined boards with respect to effecting increased output of coal in British mines was to be carried out through the offices of WPB in 1944. About one-fourth of the requirements of the British coal-mining mechanization program for 1944 were to be met by U.S. production. (*See* BRITISH-U.S. WAR BOARDS; CANADIAN-U.S. WAR COMMITTEES.)

Conservation of Materials.—Simultaneously with the step-up in demand for raw materials, the importance of enlarging and replenishing the U.S. stockpiles through conservation increased during 1943.

For example, in 1942 a nation-wide fuel conservation campaign had been initiated. In Sept. 1943 WPB in conjunction with other government agencies and private industry found it necessary to launch another nation-wide program, to induce every industrial and commercial plant as well as every private citizen in the United States to conserve not only coal, oil and gas but also electricity, water and communication and transportation facilities.

Even a reasonably economical use of coal for domestic and commercial heating was expected to save more than 20,000,000 tons annually. A 10% reduction in use of electricity would save over 4,000,000 tons of coal or its equivalent and more than 75,000,000 lamp bulbs. A 10% reduction in the use of manufactured gas would save more than 1,500,000 bbl. of fuel oil.

As the materials, facilities and manpower needed for production of shipping containers became increasingly scarce during 1943, re-use of existing containers developed into a "must." Metal was so urgently needed for war purposes that none could be used for containers unless no other material would serve. The consumption of wooden containers was 25% ahead of all available supplies. The production of fibreboard for corrugated containers was running thousands of tons a week behind actual consumption. Narrowmouthed glass jars were 18% oversold, and widemouthed jars 26% oversold. Importation of textiles for bags was difficult, and domestic production facilities were inadequate to meet the increased demand.

To give immediate impetus to the conservation of shipping containers through their re-use by manufacturers, wholesalers and retailers everywhere in the United States, the containers division, WPB, launched its container re-use program in October.

Another new campaign aimed to alleviate the serious shortage of good quality rope and cordage. The Cordage institute developed the campaign in co-operation with WPB, launching it on Oct. 1, 1943, only two months after the idea was originally broached by the war advertising council. The campaign was directed primarily to manufacturers of rope and cordage and through them reached users with the message that their existing supplies of rope had to be carefully handled so that the hard fibre content would "last and last and last." The campaign material was paid for by the industry.

A program to conserve cutting tools was in operation during 1943 and received new impetus from the growing shortage of labour for making replacement tools.

Since the beginning of the war, thousands of tons of critical materials as well as countless man hours had been made available for war production by simplifying and standardizing the designs, models and sizes of industrial products, by substituting less scarce materials for the more scarce, by salvaging materials that prewar U.S.A. threw onto the junk pile and by revising specifications.

Simplification and Standardization.—As in 1942, simplification—the elimination of unessentials from an item or a line of items—and standardization—the restriction of production to certain specified types of items in a given line—were effected in various lines of goods in 1943.

After March 15, 1943, new wood furniture patterns were prohibited, and after July 1 each manufacturer was limited to production of 35% of the patterns he offered in Sept. 1941, or 24 patterns in all, whichever was greater. Simplification enabled the furniture manufacturer to make the most efficient use of still available materials and labour.

Luggage production was limited to 7 standard types, but each manufacturer was permitted to produce these types in as many as 14 different styles.

Similar simplification and standardization orders were issued to cover silver-plated flatware, greeting cards, various types of tools and hardware, blankets, knitwear and other items.

Equipment for the armed forces likewise was simplified and standardized wherever possible, not only to save materials, labour and facilities but also to facilitate replacement of parts. For example, early in 1943 the number of basic air-cooled gasoline-engine models was reduced by 50%, and each basic model produced by a given manufacturer was made to take a single type of carburettor, muffler, air cleaner, spark plug and other parts. A uniform parts-and-maintenance manual was also accepted.

Substitution.—Synthetic rubber, brought into higher production in 1943, was employed for an increasing number of uses as a substitute for natural rubber, notably in tires, in 1943. The camelback for recapping tires was made of a combination of reclaimed rubber and 40% Buna-S and was available in greater quantity and better quality. Buna-S was also standard for tires for motorcycles, bicycles, tractors, wheelbarrows and other implements and truck and bus tires in the smaller sizes.

Ceramics and glass continued to replace metals for such items as cooking utensils and dress accessories. In the early part of 1943, research was begun in connection with ceramic stoves, and by the end of the year a satisfactory ceramic cooking-stove model, weighing less than one-third as much as the 1,085-lb. prewar metal type which it supplanted, had been developed.

Wood and paper continued to be used as substitutes, but the increased demand for these materials, in the face of a declining supply of manpower, caused a scarcity of these in turn, and their use as substitutes was limited. Plastics, formerly regarded as substitutes, became so critical that they could be used only where they could serve a particular purpose better than the material they replaced. Certain other materials, though critical, also came into use as substitutes because they were relatively less scarce than the materials they replaced. Steel, for instance, replaced copper in the new-style penny, carbon steel took the place of stainless steel in kitchen cutlery, and shoe eyelets, formerly of brass, were made of zinc-coated steel.

An important saving was accomplished in packing boxes for calibre .45 ammunition. Formerly lined with terneplate (steel covered with an alloy consisting of approximately 25% tin and 75% lead), they now had a wax-dipped liner. By the elimination of solder, along with terneplate, an additional 7 lb. of tin for each 100,000 rounds was saved.

Facilitation of production through the use of castings, pressings, assemblies and stampings instead of large forgings was a type of substitution which enabled the navy to specify alloys and products that were more easily manufactured, to replace those involving longer and more expensive methods.

Another example of substitution by the navy was that of the use of reclaimed and synthetic instead of crude rubber in the manufacture of self-sealing tanks for planes.

Salvage.—Salvage of waste paper and collection of iron and steel scrap were the most urgent problems of 1943 fostered by the salvage division of WPB. At the same time that military and industrial uses of paper skyrocketed, manpower shortages in the forests kept the production of wood pulp for containers and other products almost 25% below that of 1942. Waste paper salvage was of crucial importance in alleviating the wood-pulp shortage.

New impetus was given to the continuing program for the collection of iron and steel scrap by the inauguration on Oct. 1, 1943, of the "victory scrap bank," a special drive to bring lagging collections to a total of 15,000,000 tons for the last six months of the year.

Collection of household fats, initiated in Aug. 1942, reached a peak of almost 8,500,000 lb. in June 1943 and then declined slightly.

Though by the end of the year the impressive total of 200,000,000 tin cans, or 20,000 tons, was being collected for detinning and other war purposes each month—20 times as many as at the beginning of the program—two out of three tin cans that went into homes were still being lost to the war effort. The salvage of silk and nylon stockings for use in the manufacture of powder bags, parachutes and other military items was discontinued Sept. 30, 1943, after a grand total of more than 50,000,000 pairs had been donated by the women of America in the 11 months during which the campaign was in operation. (*See* also SALVAGE DRIVES, U.S.)

Revision of Specifications.—Government specifications had to be continually revised and new requirements established in order to keep pace with rapidly shifting stockpiles of vital war materials in 1943. Working closely with the army, navy and other interested government departments, WPB's conservation division, by means of its specification projects, tackled the problem of conserving materials in limited supply, finding substitutes for the most critical materials and bringing specifications into line with the changing supply.

The number of government department specifications already revised or under development was well past the 800 mark in Dec. 1943. The materials and products for which federal specifications were completed or being prepared included: brass and bronze castings and ingots, aluminum alloy castings, salt spray corrosion tests, paint colours, rubber, plastics, paper, 55-gal. steel drums for gasoline, brushes and certain types of containers.

Civilian Requirements.—In 1943, for the first time since U.S. entry into the war, the problem of providing civilians with the goods they needed to maintain health and working efficiency began to reach an acute stage with respect to certain categories of items.

Until the middle of 1942, inventories were sufficiently large and the war program left enough resources free to supply aggregate civilian demands at an expanding volume. At the same time, the increased individual incomes obtained from war production and related activities insured that these expanding demands would result in actual purchases.

Later, inventories began falling, while manpower and facilities for civilian production and distribution were seriously reduced. Peak war schedules were placing additional claims on U.S. national resources.

Office of Civilian Requirements.—This office, successor to the Office of Civilian Supply, WPB, in fulfilling its function of maintaining production and distribution of all essential civilian goods in so far as was consistent with demands upon materials, facilities and manpower for war production, was taking various steps to correct this situation.

By directing manufacturers or distributors of such urgently needed items of farm equipment as shovels, forks and the like to set specified quantities of these products aside for farmers, OCR was making it easier for farmers to get the equipment they needed to meet the high food-production goals.

Priority assistance was also given to manufacturers of needed types of baby goods, to replenish the falling supply.

A continuing project of OCR in 1943 was a nation-wide survey, culminating in the questioning of 5,739 households and conducted according to the best modern survey techniques, to determine what shortages in civilian goods were causing actual hardship, what products in short supply were in most acute demand and whether available supplies were being fairly distributed. (*See* also AUTOMOBILE INDUSTRY IN THE WAR; BUDGET, NATIONAL; BUSINESS REVIEW; NATIONAL INCOME AND NATIONAL PRODUCT;

PRIORITIES AND ALLOCATIONS; RATIONING; SALVAGE DRIVES, U.S.; UNITED STATES; WAR LABOR BOARD, NATIONAL; WAR MANPOWER COMMISSION; WAR PRODUCTION BOARD; WORLD WAR II.)

War Production Board. War production in 1943 was approximately double that of the previous twelve months. During the period of this accomplishment the War Production board, headed for the second successive year by Chairman Donald M. Nelson, underwent a number of organizational changes. First and principal was creation of the office of executive vice-chairman. To this vitally important post Nelson appointed Charles E. Wilson, president of General Electric company, who had joined the board in 1942 as production vice-chairman. Wilson, charged with responsibility for conduct of war production programs and operations, appointed a program vice-chairman and an operations vice-chairman. At the end of 1943, these positions were filled, respectively, by J. A. Krug, a top executive in WPB and its predecessor, the Office of Production Management, and Lemuel W. Boulware. Boulware, who joined the board early in 1942, was serving as deputy controller of shipbuilding at the time of this appointment. Krug also became chairman of the requirements committee.

Other new offices established under the executive vice-chairman during the year included those of vice-chairmen for manpower requirements, labour production, metals and minerals, and that of a vice-chairman in charge of field operations, facilities bureau, bureau of planning and statistics, procurement policy division, Office of Production Research and Development and the resources protection committee. Filling the latter position was Donald D. Davis, formerly operations vice-chairman. Davis was also chairman of the facilities committee.

The two new vice-chairmen for labour problems were Clinton S. Golden, Pittsburgh, Pa., working on labour scarcities and surpluses, and Joseph D. Keenan, Chicago, Ill., responsible for labour productivity. Golden went to the board from the position of assistant to President Philip Murray of the United Steelworkers of America (C.I.O.). Keenan was secretary of the Chicago Federation of Labor (A.F. of L.).

In Dec. 1943, Arthur H. Bunker, former chief of the aluminum and magnesium division, became vice-chairman for metals and minerals and as such became directing head of the steel, copper and aluminum divisions, the minerals bureau and the minerals resources co-ordinating division and its related committees. Also reporting directly to Wilson was a new war production drive division, established to stimulate plant productivity through the setting up and operation of labour-management committees.

During the year William L. Batt became vice-chairman for international supply. Batt also was Chairman Nelson's representative on the Combined Production and Resources board and, by appointment by President Roosevelt, American member of the Combined Raw Materials board, of which he served as chairman.

New agencies set up during 1943 and directly responsible to Chairman Nelson were the Office of War Utilities, Smaller War Plants corporation and the Office of Civilian Requirements. The first was headed by J. A. Krug, the second by Albert M. Carter as acting chairman, while Arthur D. Whiteside, president of Dun and Bradstreet, was the vice-chairman heading the office which, as a claimant agency, represented the needs of the civilian population in a war economy.

An important development of the year was the increasing responsibility given the 13 WPB regional offices. Starting with a grant of authority to approve or reject applications for priority assistance in certain limited categories, the decentralization program was extended until, by the end of 1943, within policies laid down in Washington, the regional directors were exercising a considerable degree of discretionary judgment. (*See* also BUSINESS REVIEW; HOUSING; PRIORITIES AND ALLOCATIONS.)

War Relief, U.S. The President's War Relief Control board was established by executive order No. 9205 July 25, 1942 to further, for the duration of World War II and six months thereafter, the productive use of voluntary contributions for the relief of war sufferers in foreign countries, or for the welfare of the personnel of the armed forces and the merchant marine of the United States.

The solicitation and collection of public contributions were controlled by the registration or licensing of agencies authorized to administer foreign war relief and national military welfare programs approved by the board. Approval was based upon these major considerations: the necessity for the specific relief or welfare; whether the purpose to be served was adequately fulfilled or might be adequately fulfilled by existing programs and organizations; whether it could be carried out under existing political, economic and military limitations; the estimated costs and the relationship to accepted budgets; the appropriateness of the suggested means of financing; considerations of foreign policy, including export of commodities and transfer of funds; character and scope of the relief and welfare programs financed by the United States government and the American Red Cross abroad and at home; availability of supplies and shipping; and the protection of normal home charities.

Violation of conditions and regulations, or undue costs of administration, were made grounds for the suspension or revocation of the licence to operate.

The major voluntary agencies registered with the board came together in 1943 as a federation of war philanthropies financed through community war chests. The federation, known as the National War fund, was organized with the co-operation of the President's War Relief Control board. The programs of the member agencies were co-ordinated, after budget hearings, to permit one annual country-wide appeal for funds to support war charities other than those of the American Red Cross.

Registered organizations numbered 126 at the end of 1943, of which 101 were for foreign war relief activities. During the year there was contributed to registered agencies for foreign war relief a total of $47,852,035 in cash, and $12,708,145 as the value of goods in kind. Of the cash received, $42,088,225 was transmitted abroad and goods in kind valued at $9,928,947 were shipped. The chief beneficiaries of these private relief resources were Great Britain, China, the soviet union and Greece. It should be understood that the totals do not include the value of shipments of food, medicines and clothing provided through the operations of lend-lease and the American Red Cross.

In addition to the 101 agencies registered with the board for foreign war relief, there were 25 registered agencies engaged in domestic welfare on behalf of the armed forces and the merchant marine. Their total contributions were not available, but $65,352,000 was included in the National War Fund campaign for 1943 for these services. (*See* also PRISONERS OF WAR; RED CROSS; RELIEF.) (J. E. Ds.)

War Relocation Authority. Established by executive order of the president March 18, 1942, the War Relocation authority was set up primarily to provide for the 110,000 people of Japanese ancestry who were evacuated by military order from the Pacific coast region in the spring and summer of 1942. The agency's prime objective was to relocate as many of these evacuated persons as possible on farms and in cities outside the restricted west coast zone. While

resettlement went forward, WRA maintained the evacuated people in barracks cities known as relocation centres, and provided them with food, shelter, medical care, work opportunities and standard education for the children.

Relocation of the evacuated people out of these centres into normal communities began on a significant scale in the early months of 1943 and continued at an average rate of about 400 departures a week throughout the summer. By the end of 1943, more than 16,000 former residents of the centres had resettled across the country, and during the year 8,500 went out of the centres on seasonal agricultural jobs. A considerable portion of the latter group were expected to locate year-round jobs and apply for indefinite leave from the centres.

Focal areas for relocation were in the Great Lakes states and the intermountain west, with largest numbers in Chicago, Denver, Salt Lake City and Cleveland. Lesser numbers were residing in scores of other communities throughout the intermountain region, the middle west and the east.

Under WRA regulations leave permits were granted, upon application, to any residents of the centres not considered in any way dangerous to the security of the country. Information from federal intelligence agencies and from records developed by WRA were used in determining eligibility for leave. Those evacuees who applied for repatriation or who refused to pledge unqualified loyalty to the United States, or whose past records cast doubt on their loyalty were separated from the others and located at a single centre at Tulelake in northern California, where a series of disorders broke out early in Nov. 1943, and caused officials to call out regular army troops and declare temporary martial law Nov. 13–14. (*See* also ALIENS.) (D. S. MR.)

Warren, Whitney (1864–1943), U.S. architect, was born Jan. 29 in New York city. Designer of railway, business and residential buildings and hotels, Mr. Warren in 1920 was commissioned to restore the Louvain library in Belgium destroyed by the Germans in 1914. His plan to complete the balustrade with a Latin inscription: "Furore Teutonico Diruta: Dono Americano Restituta" (Destroyed by German Fury: Restored by American Generosity) met with a great deal of controversy from pacifist groups. The library was again demolished in the Nazi blitzkrieg in May 1940 and its 700,000 volumes went up in flames. Mr. Warren retired from the architectural firm of Warren and Wetmore in 1933. He died in New York city, Jan. 24. (See *Encyclopædia Britannica.*)

War Savings Stamps: *see* POST OFFICE.

War Shipping Administration. The War Shipping administration was established Feb. 7, 1942, by executive order of President Roosevelt. Broad powers in acquisition, use and operation of ships were given the agency to supervise, for the duration of the war, the operations of all United States merchant vessels.

Organization of the War Shipping administration began with the appointment of Rear Admiral E. S. Land, U.S.N. (retired), chairman of the Maritime commission, as administrator. Many executive positions were filled by officials from the Maritime commission, thus forming an interlocking directorate for the two agencies in dealing with wartime maritime policy.

In conjunction with the British ministry of transport, War Shipping administration assumed control of movements of vessels in the United Nations shipping pool and made allocations of tonnage where needed.

The War Shipping administration also acquired the responsibility of properly and adequately manning ships, making surveys of crew requirements at all ports and forecasting the nation's maritime manpower needs. Besides training merchant marine crews and officers, it recruited many men from private life with marine experience to return to sea duty. (E. S. L.)

Washington. A state in the extreme northwest United States, popularly known as the "Evergreen state," admitted to the union Nov. 11, 1889. Total area, 68,192 sq.mi. of which 66,977 sq.mi. are land; pop. (1940) 1,736,191 (1943 est. —1,848,255); native, 1,525,812; foreign born, 210,379. Capital, Olympia (13,254). According to 1943 estimates the three largest cities had grown perceptibly since 1940; Seattle from 368,302 to 485,000 (est.); Spokane from 122,001 to 154,365 (est.); Tacoma from 109,408 to 142,000 (est.). The urban population in 1940 was 921,969 or 53.1%.

History.—The state legislature in its 28th session responded in 1943 to a popular initiative petition and passed a measure authorizing public utility districts to combine and acquire electric power projects through eminent domain procedures. Opponents of the bill filed a referendum petition. The state supreme court sustained their contention that the emergency clause in the act was not valid and therefore did not militate against a referendum on the bill. The court also declared that children suspended from a school because they did not give the flag salute were not delinquent, providing they were not disrespectful to the national emblem.

State officials in 1943 were: governor, Arthur B. Langlie; lieutenant governor, Victor A. Meyers; secretary of state, Belle Reeves; treasurer, Otto A. Case; attorney-general, Fred E. Lewis, acting, Smith Troy on leave; chief justice of state supreme court, George B. Simpson.

Education.—During the school year 1942–43, average daily attendance in elementary and secondary schools was 265,880; the number of teachers was 11,661. Total current expenditures were $35,183,543.12 (est.) and the cost per pupil in attendance was $132.33 (est.). Salaries of teachers, including superintendents, averaged $1,908.19.

Public Welfare, Charities, Correction.—The total amount spent upon public assistance in the state, including federal direct expenditures and state aid was $40,234,436.45 during the period of Oct. 1942 to Sept. 1943 inclusive. An average number of 96,147 persons received a total of $38,107,122.71 in all forms of assistance. An average number of 62,422 old persons received a total of $19,476,942.51. An average number of 14,551 children received a total of $2,952,401.19. An average number of 921 blind persons received aid totalling $375,778.46. On Sept. 30, 1942 there were nine state charitable institutions, with a total population of 9,508, and four correctional institutions with a total population of 2,080 inmates.

Communication.—In 1940 there were 6,297 mi. of highways in the state and 5,268 mi. of railroad.

Banking and Finance.—The total assessed valuation of all real and personal property subject to tax for 1943 was $1,212,960,741. On April 1, 1943 the state cash balance was $51,997,742.78. The bonded indebtedness on Dec. 1, 1943 was $9,454,000, easily covered by various bond retirement funds. Total tax receipts for the fiscal year ending March 31, 1943 were $147,582,736.07, and disbursements were $127,697,402.34. One hundred and thirty-two banks in the state reported a total capital of $31,228,500; capital surpluses and undivided profits of $62,175,500; deposits of $1,578,638,000; and assets of $1,654,016,700.

Agriculture.—Income from crops in 1942 was $195,812,000; from livestock $129,992,000; from government payments $7,951,000.

Manufacturing.—In 1939, latest year for which complete fig-

Leading Agricultural Products of Washington, 1943 and 1942

Crop	1943 (est.)	1942
Wheat, bu	52,193,000	55,148,000

Oats, bu	9,261,000	10,080,000

ures were available in 1943, the total value of manufactured products was $636,649,809; 101,136 salaried persons and wage earners received a total of $143,412,064. Shipbuilding and plane construction probably equalled or exceeded lumber and sawmill products as the state's leading industries in 1943.

Mineral Production.—Mining statistics were a military secret in 1943 but probably exceeded the 1941 figure of $31,590,023, a post-depression high. Copper and zinc, of which metal a new rich vein was discovered, were exploited to the very limit.

(H. J. De.)

Washington, District of Columbia, national capital of the U.S.A., and 11th largest of U.S. cities, with a population of 663,091 by federal census of 1940. In 1943 the estimated population was 900,000. In the metropolitan area the population increased from 900,000 in 1940 to an estimated 1,300,000 in 1943. The federal government in 1943 owned outright about one-fourth of the 44,320 ac. in the District of Columbia. Private taxable property in the district amounted for the fiscal year 1943–44, to $1,354,348,720—$495,378,491 for land and $858,970,229 for improvements. The federal government's land was valued at $359,803,472 with $336,723,350 for improvements. The district owned lands and improvements to the value of $90,466,248, and property exempt from taxation, such as churches and schools, amounted to $114,110,505. No taxes are paid on federal or district property, but the federal government in 1943–44 made, according to custom, a $6,000,000 lump sum appropriation to supplement revenues from private property, highway and water funds to meet a budget of $56,517,465. The property tax rate of $1.75 per $100 on a full-valuation assessment gave a levy of $23,701,336. The District of Columbia had no bonded indebtedness in 1943, and arrangements had been made to retire a debt of less than $5,000,000 by 1945.

The constitution of the U.S. gave congress the exclusive legislative authority over the district, which is administered by a commission of two citizens appointed by the president and an engineer nominated from the corps of engineers, U.S. army.

Many residents of the District of Columbia vote in the states from which they came, but no franchise is exercised in the district, which belongs to all the people of the U.S. During 1943, proposals were revived to provide for residents of the district who do not vote elsewhere a vote for president of the United States and possibly for some form of representation in congress. Legal opinion was announced to the effect that so-called home-rule would run counter to the provisions of the constitution.

From 1934, when the Alley Dwelling act was passed by congress, to 1943, $865,000 was expended on slum clearance and $15,000,000 for low-cost housing. On the defense program, $3,200,000 was expended before Pearl Harbor and in the following two years $11,000,000 was spent on demountable homes and $3,500,000 on demolishable and temporary structures. The National Capital Housing authority estimated in 1943 that there would be a postwar need for $100,000,000 worth of public housing over a period of 15 or 20 years to supply housing to low-income families.

The National Capital Park and Planning commission during 1943 drafted postwar plans to secure a co-ordinated program of public works, to secure legislative authority for the redevelopment of the blighted and decadent areas, and to formulate a program of planning projects for the Washington region as a whole. The District Recreational department proposed in 1943 a $15,000,000 recreational improvement program on a postwar six-year basis.

Wavell, Archibald Percival, Viscount (1883–), British soldier, born in May, was the son of Maj. Gen. A. G. Wavell. Following his father's career, he enlisted in the Black Watch in 1901 after studying at the royal military college and the staff college and saw action in the Boer War, in India and in World War I. He then served with the Egyptian expeditionary force until 1920. In 1938 he was promoted to lieutenant general. From 1937 to 1938 he commanded the British troops in Palestine and Trans-Jordan, and in 1940 he became commander in chief of the British forces in the middle east. His small force of empire soldiers swept the Italians out of Cyrenaica in Libya, and he supervised the operations in East Africa which recaptured British Somaliland and took Italian Somaliland, Eritrea and Ethiopia from the Italians. He suffered serious reverses at the hands of the Germans, however, in Libya, Greece and Crete, and on July 1, 1941, he was succeeded as middle east commander by Gen. Sir Claude Auchinleck, whose post as commander of the British forces in India Wavell thereupon took over. In August, Wavell directed the British campaign which resulted in the joint British-Russian occupation of Iran. On Jan. 3, 1942, a month after the Japanese attack on Pearl Harbor, Sir Archibald was named supreme commander of allied armies in the far east, but in March of the same year, he was returned to command of his former post, the India-Burma area. On June 19, 1943, he was appointed viceroy of India and on July 1, was elevated to the peerage as Viscount Wavell. A few months after his new appointment, he defended Britain's record in India, declaring on Sept. 23 that while Britain had made mistakes in administration, it had made few blunders of greed and fear. Wavell took office in inauspicious times. He was faced with one of the worst famines in India's history and with general apathy of the population toward the United Nations war effort. Wealth and Income, U. S. Distribution of.

Despite wide interest in this subject and its recognized importance, no completely satisfactory study of the size distribution of income in the United States had been made up to the close of 1943. The most comprehensive study was that issued by the National Resources committee on the distribution and disposition

of income for the year 1935–36.

In 1942, however, the bureaus of labor statistics and home economics conducted small studies of the distribution of income and expenditures for 1941 and the earlier part of 1942 in order to provide more current data. Some of the basic information from these studies is presented in Tables I and II. It will be noted that even for the latest period there was a high degree of inequality in the distribution of income. Families with incomes of $1,500 and less, for example, constituted 47% of all families in 1942, whereas they received only 14% of total income. On the other hand the 6% of all families having incomes of $5,000 and over received 38% of total income.

It is apparent from Table I, however, that the sharp increase in total income that occurred during World War II brought a striking change in the distribution of income that was moving families out of the smallest income classes into the larger income classes. In 1935–36 the largest single group of income recipients was that which received between $500 and $1,000, while in both 1941 and 1942 the largest group was that receiving between $2,000 and $3,000.

Inasmuch as the rise in incomes tended to take families out of the smallest income groups, the families receiving $1,500 or less obtained a much smaller proportion of the aggregate consumer income in 1941 and 1942 than they did in 1935–36. As can be seen in the table, families with $1,500 or less received 38% of aggregate income in 1935–36 but only 14% in the early part of 1942. This does not mean, as is sometimes thought, that the low income families failed to participate in the increase in income but rather that, by participating in the increase in income, they were taken out of the smallest income groups.

The distribution of expenditures by income-size class is shown in Table II for 1941. The outstanding fact in this table is the very high percentage of total income accounted for by food and housing expenditures for the lowest income classes. On the other hand, many other types of expenditure formed a remarkably constant percentage of income from one income class to another with the exception of the group with incomes under $500.

The data on this size-distribution of income were on a family basis; that is, all the income of the various members of a given family was lumped together as one income. For some problems, however, distribution of income arranged on the basis of individual income recipients is most appropriate, notably in connection with tax questions. Such a distribution of income, submitted by the treasury department to congress in connection with the 1943 Revenue act, is shown in Table III. Of course, in this table a much smaller percentage of income recipients are in the group above $5,000 than was the case in Table I, since a family with several income recipients might easily be in the class above $5,000, even though no one of the income recipients was in that class. The table shows the sharp cut made in the high income group by the heavy taxes being imposed during the war. It also brings out how large a proportion of income recipients (almost 90%) had incomes of less than $3,000—even under conditions of wartime prosperity.

State Distribution of Income Payments.—Statistics on the geographic distribution of income in the United States are provided by the department of commerce's annual estimates of income payments to individuals in the various states, as shown in Table IV. Both total and per capita incomes vary substantially from one region of the country to another. By and large, lower levels of income are characteristic of the predominantly agricultural states. It must be kept in mind, however, that these statistics relate to dollar incomes and consequently do not take account of the geographic differences in the cost of living.

The per capita income of $852 for the United States in 1942 was by far the largest ever reached, comparing with $680 in 1929 and $693 in 1941. In 1939 average per capita income was

Note. Figures are rounded and will not necessarily add to totals.

[1]The classification by net income brackets is in accordance with net income as determined by the Current Tax Payment act of 1943.

[2]Includes only the income recipients who would be potential income-tax paying units if there were no exemptions and if the present advantage to filing separate returns were retained. The income of income recipients who are dependents for purposes of the federal individual income tax is included, although the number of such income recipients is excluded.

[3]Income payments are as defined by the department of commerce.

[4]Refers to the personal taxes paid under present law in the calendar year rather than liability for personal taxes incurred in the calendar year. Personal taxes consist of federal, state and local individual income taxes, estate, inheritance and gift taxes, property taxes (excluding taxes on business property and rented houses), taxes and licences on motor vehicles not used in business, miscellaneous personal taxes and nontax payments to government.

only $539.

The precipitous rise in per capita income during the war years tended to bring the poorest states closer to the level of income prevailing in the richer states. For example, in 1939 per capita in the southeast region of $303 was only 43% of the per capita income in the middle east region. By 1942, however, the per capita in the southeast region had risen to 50% of that prevailing in the middle east region.

Source: United States Department of Commerce.

Although all states participated in the wartime income increase, the gains varied from a low of 28% for New Hampshire to 116% for Arkansas. In general, states in the southeast, southwest, northwest and far west regions showed increases in income greater than the national average. The reasons for the better-than-average gains in income were not the same in all regions. In the south, for example, an important factor was the increase in income due to the influx of population arising from the location of army camps in that region. In the far west, on the other hand, there was an unusually sharp increase in income contributed by manufacturing industries, whereas in the northwest the increase in farming income played a dominant role. Throughout the country agricultural income rose more substantially than did income of other types. Furthermore, the increase in agricultural income was not accompanied by an increase in number of persons engaged in that industry, in contrast to the increase in wage and salary income, so that the rise in real prosperity of the agricultural regions was very material.

The changes in the geographic distribution of income during the war period followed to a considerable degree the trends established during the prewar years. Industrialization of the south and the far west was notable. While the trends during the war were accelerated, they had been basically in evidence for many years. The only significant exceptions to the continuance of prewar trends in geographic shifts of income were Colorado, Montana and Wyoming. (*See* also BUDGET, NATIONAL; CENSUS, 1940; NATIONAL INCOME AND NATIONAL PRODUCT.)

Webb, Beatrice Potter

(1858–1943), British Socialist and author, was born Jan. 22 in Cotswold Hills, Gloucester, England. The daughter of a wealthy railway executive, she tired of her aimless social life and early in her youth found new interest in social work. Her investigations into the living conditions of the working classes took her to London, where she made studies of the dock area, of cotton operatives and the sweat shops in the east end. She herself took a job in a tailoring establishment to learn first-hand the conditions of the workers. When the Fabian society came into being in the 1880s, she became identified with the Socialist group and in 1892 married Sidney Webb, one of its leaders. Together they continued their work toward social reform and collaborated extensively on social and economic publications. (*See* SIDNEY WEBB, *Encyclopædia Britannica.*) The two were constantly surrounded by a swarm of secretaries, who gathered facts and statistics and compiled data which the Webbs used in their exhaustive studies. When Mr. Webb received the title of the 1st Baron Passfield in 1929, she refused to use the title, preferring to be known as Mrs. Webb. Her autobiography, *My Apprenticeship,* was published in 1926. She died at her home, Passfield Corner, in Liphook, Hampshire, April 30.

Webster, Leslie Tillotson

(1894–1943), U.S. medical research scientist, was born July 23 in New York city. He received his M.D. from Johns Hopkins medical school in 1919, spent the next year there as assistant in the pathology department and later in 1920 served in a similar capacity with the Rockefeller Institute for Medical Research. He was made a member of the institute in 1934. Dr. Webster, using laboratory mice to determine the mechanism of the spread of diseases, was credited with creating a branch of epidemiology known as "experimental epidemiology." He also carried out extensive research on rabies, devised tests for early diagnosis and for determination of the quantitative potency of anti-rabic vaccines. His book, *Rabies,* was published in 1942. He died in Scarsdale, N.Y., July 12.

Wedgwood, Josiah Clement Wedgwood,

1ST BARON, OF BARLASTON (1872–1943), British M.P., descendant and namesake of the famous potter, was born March 16. He served in the Boer War and World War I and was sent on a mission to Siberia in 1918 with temporary rank of colonel. He first joined the British Labour party ranks after the war, was vice chairman, 1921–24, and was chancellor of the Duchy of Lancaster

in the Ramsay MacDonald government. In parliament he represented Newcastle-under-Lyme, 1906–42, and in the latter year was raised to the peerage as first Baron Wedgwood of Barlaston. An active crusader for many years, he urged the establishment of Palestine as a Jewish homeland with dominion status, and during an unofficial visit to the United States in June 1941 advocated a union of Great Britain and the U.S. as a democratic barrier against the totalitarianism then engulfing Europe. He was the author of *Local Taxation in the Empire* (1928), *History of Parliament, 1439–1509,* and books on Staffordshire history and pottery. He died in London, July 26.

Welles, Sumner (1892–), U.S. undersecretary of state, was born Oct. 14 at New York city and was educated at Groton (Mass.) school and at Harvard. In 1922 he was U.S. commissioner to the Dominican Republic, and in 1924 he was President Coolidge's personal representative in Honduras, then in the throes of revolution. Welles was appointed assistant secretary of state April 6, 1933, and except for a short period as ambassador to Cuba in 1933 held this office until his appointment May 21, 1937, as undersecretary of state. In the spring of 1940 he undertook a "fact-finding mission" to Germany, Italy, France and Great Britain. During 1941 he held innumerable interviews with various European and Asiatic diplomats, with particular attention to the status of unoccupied France in its relationship to Germany.

Welles headed the U.S. delegation to the Pan-American conference held at Rio de Janeiro early in 1942. During the spring of 1943 he was chairman of a state department committee that drafted a document which, with few changes, was adopted as the official agreement of the Moscow conference in October.

Increasing friction between Welles and Secretary of State Cordell Hull and public differences on policy were said to have led to Welles' resignation, announced Sept. 25, 1943, and the appointment of Edward R. Stettinius, Jr., as his successor.

Wellesley College. A women's college in Wellesley, Mass., founded in 1870 by Henry Fowle Durant, Wellesley occupies 400 ac. A four-year liberal arts college, Wellesley is pre-eminently for candidates for the B.A. degree but offers also the degrees of M.A., M.A. in Education, M.S. and a certificate in Hygiene and Physical Education. By the addition of courses and new combinations of courses in the curriculum, students are enabled to prepare for positions immediately concerned with the war and postwar effort. The president of the college, Mildred H. McAfee, continued on leave of absence in 1943 (since Aug. 1942) to serve as director of the Women's Reserve of the U.S. Naval Reserve. In Oct. 1943, the Navy Supply Corps school at Harvard university opened a branch school at Wellesley college, with 400 officers in training.

For statistics of enrolment, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (M. H. McA.)

Wells, Harry Gideon (1875–1943), U.S. pathologist, was born July 21 at New Haven, Conn. A graduate of the Sheffield Scientific school (Yale) in 1895, he held degrees from Lake Forest university and Rush Medical college and received his Ph.D. from the University of Chicago in 1903. An authority on cancer and tuberculosis, Dr. Wells began his life-long association with the department of pathology at the University of Chicago in 1901, was made professor of pathology in 1913 and became professor emeritus in 1940. He was dean in medical work, 1904–14, director of medical research at the Otho S. A. Sprague Memorial institute, Chicago, twice president of the American Association for Cancer Research and at one time headed the Association of Pathology and Bacteriology. Dr. Wells was the author of *Chemical Pathology* (1907), *Chemistry of Tuberculosis* (1923) and *Chemical Aspects of Immunity* (1925, 1929). He died in Chicago, April 26.

Wertheimer, Max (1880–1943), German psychologist and philosopher, was born April 15 in Prague. He held professorships in philosophy and psychology at Berlin university, 1920–29, and at Frankfurt-on-Main university, 1929–33. Shortly after Hitler came to power, he left Germany and went to New York city, where he served as professor of psychology on the graduate faculty of the School of Political and Social Science (The University in Exile). One of the founders of the Gestalt school of psychology and co-originator of a psychological deception test based on an association of words, Dr. Wertheimer was an authority in experimental perception, the psychology of thinking and social psychology. He was the author of *Productive Thinking* and edited and published *Psychologische Forschung* in Berlin from 1921 to 1936. He died at his home in New Rochelle, N.Y., Oct. 12.

West Africa, British: *see* BRITISH WEST AFRICA.

Western Australia. A state of the Australian commonwealth; area 975,920 sq.mi.; pop. (est. Dec. 31, 1941) 467,082. Chief city: Perth (pop. Dec. 31, 1940—including Fremantle) 228,000. Governor: (vacant in 1943); lieutenant governor in 1943: Sir James Mitchell.

History.—The Labour government, under the premiership of J. C. Willcock, remained in office during 1943. Under the federal government's regulations for the planning of production to conform to war requirements and the best utilization of manpower, there was a compulsory reduction by 33⅓% of the area under wheat cultivation. A new factory and chemical works was set up by the state government for the production of potash in sufficient quantity to supply the entire needs of Australia. Before the war imports of potash were 13,000 tons p.a. The state government also undertook the building of a number of 350-ton wooden ships. The gold-mining industry was adversely affected by labour diversions to the armed forces and to war industries; production had fallen by more than 25% since the outbreak of war.

Education.—In 1940: state primary schools 804; average attendance 50,198. State secondary schools 6; average attendance 1,796.

Finance.—Revenue (1941–42), £A11,940,000; expenditure, £A11,938,000; debt outstanding (June 30, 1942), £A97,359,000.

Communication.—Roads (June 30, 1940) 29,722 mi.; railways (Dec. 1942): government, 4,381 mi.; motor vehicles licensed (March 31, 1943): cars 29,229; trucks 20,688; cycles 3,710. Wireless receiving set licences (March 31, 1943) 96,288.

Agriculture and Manufacturing.—Production: wheat (1942–43) 20,700,000 bu.; wool (1941) 74,985,000 lb.; gold (1942) 848,180 fine oz. Industry and labour (1940–41): factories 2,056; employees 22,734; gross value of output £A21,824,974; unemployment (trade union returns) (March 1943) 1.6%.

(W. D. MA.)

West Indies. An archipelago between South America and Florida, embracing the Greater Antilles (Cuba, Hispaniola, Puerto Rico, Jamaica, and adjacent small islands), the Lesser Antilles chain of small islands between Puerto Rico and the South American mainland, and some other, more distant islands, including Curaçao and Aruba. The archipelago has a total land area of around 99,000 sq.mi. The population (estimated roughly as nearly 13,000,000 at the end of 1943) is 75%

white and 25% Negroid in Cuba and Puerto Rico, 80% to 99% Negro and mulatto elsewhere, except in Trinidad, where 40% is East Indian. Languages: Spanish, English, French and Netherlandish. Religion: generally Roman Catholic. Politically, the area is divided into three republics, six British, one Netherlands, and two French colonies, and two United States dependencies. The United States has naval and military bases under lease in a number of the islands.

History.—Politically, the main event was the shift in political status of the French colonies from Vichy allegiance to a quasi-adherence to the French Committee of Liberation (*see* FRENCH COLONIAL EMPIRE: *French Possessions in America*). With this shift the entire archipelago was, for the first time in its history, at war against a common enemy. It was still a combat area, but the intensity of the submarine warfare which had marked 1942 was notably relaxed. Commerce and trade were less hampered and on a sounder basis. Nevertheless, war strain was still felt, with some of the islands, as Trinidad, a centre of war production and other activity, flourishing, and Jamaica still stunned from her inability freely to ship her produce.

Trade and Production.—Normally trade is mainly with the United States and Canada and, in the European colonies, with their respective metropolises. During 1943, however, this trade was distorted by war factors. War goods were being produced at capacity, nonwar production was in the doldrums. Sugar is the dominant export crop in most of the islands. Cacao, bananas (in Jamaica), cotton, citrus fruits and spices are likewise important. Except in Trinidad and Curaçao, and to a degree in Cuba, agriculture is the sole economic basis. Petroleum and asphalt are important in Trinidad, and some metals are found in Cuba and Hispaniola. Curaçao is a leading world oil-refining centre.

Communication.—External communication is by sea and air. The leading islands are directly connected with the Pan American Airways world network. The British West Indian Airways and K.L.M. (Royal Netherlands Airways) both extended their insular services during 1943, and the latter announced plans for inclusion of St. Martin as a regular port of call in 1944. (*See* also CUBA; CURAÇAO; DOMINICAN REPUBLIC; FRENCH COLONIAL EMPIRE; HAITI; HISPANIC AMERICA AND WORLD WAR II; PUERTO RICO; VIRGIN ISLANDS; WEST INDIES, BRITISH.)

BIBLIOGRAPHY.—*Canada-West Indies Magazine* (Montreal, monthly); *Crown Colonist* (London, monthly); *West Indies Year Book for 1943* (London, New York, 1943).

West Indies, British.

The several British islands in the West Indies have an area aggregating 8,240 sq.mi. Their total population was estimated at more than 2,300,000 at the end of 1943. Except for Jamaica, where a census was taken during 1943 (with results only partially available), there had been no census after 1931, and in some colonies none after 1921. Racially the population ranges from 75% to 99% Negro and mulatto except in Trinidad. There it is 40% East Indian and 1% Chinese. The chief cities are the colonial capitals (*see* table on page 760), but only Kingston, Port-of-Spain, and to an extent Bridgetown are important beyond the limits of their respective colonies.

Politically, the islands are administered separately or in groups as British crown colonies (*see* table). After 1940 the island colonies, with British Guiana and British Honduras, had a common comptroller for development and welfare, with whom were associated some other officials with special duties. Each colony has a governor or other chief executive (in the Leeward Islands a "president" subordinated to the governor of the group) and lesser officials appointed by the crown. (For names of governors, *see* BRITISH EMPIRE.) Barbados has the third oldest representative assembly in the British empire. Trinidad and Jamaica are in process of reorganizing their political structure on a broader, more representative basis, with elected majorities in the legislative assemblies. The smaller colonies usually have appointed majorities. The trend throughout, however, is toward an eventual federation, possibly including British Guiana and British Honduras, with greater local self-government.

The United States, under an agreement effected March 27, 1941 (supplanting a previous provisional one of Sept. 3, 1940), maintains several military, naval and air bases under 99-year lease. These are in Jamaica, Trinidad, Antigua and St. Lucia.

History.—With the lessening menace of axis submarines in West Indian waters, shipping shortage was not so acutely felt as in 1942. Trinidad, centre of petroleum, defense activity and air transport, suffered from a manpower shortage which adversely affected harvesting. Heavy pay rolls from United States defense building continued to swell savings-banks deposits. Living costs were 89% over 1935, and rationing and price control were necessary on many commodities.

Jamaica, on the other hand, was faced with an unemployment problem. An imperial subsidy of £500,000 a year was continued for the banana industry, whose export trade was around 6% of 1938 levels. Jamaican foreign trade was reportedly generally improved during the first half of 1943. Relief projects employed 12,000 persons. In mid-year 9,435 Jamaican agricultural labourers went to the United States under contract. Before the end of the year their remittances home had exceeded £100,000. Meanwhile, living costs were 60% greater than in 1939 despite £218,000 in subsidies, with a further £500,000 allocated for the year ending Sept. 30, 1944.

The West Indian colonies continued to be the principal recipients of colonial development and welfare loans and grants during 1943, being allotted over £2,500,000 of a £4,500,000 total. These included projects for road construction in the Leewards, rural health, a food storage plant in Grenada and numerous others.

Politically, interest centred in the long-drawn-out question of a new constitution for Jamaica. Adult suffrage, local government reform and popular control of the assembly were agreed upon but the exact form of the constitution was undetermined at the close of 1943.

Education.—In 1943 there were approximately 1,378 elementary schools, with an estimated 329,355 enrolment, as well as secondary schools. Jamaica, with 667 elementary schools, had 164,000 enrolment. Higher education is provided at Codrington college, near Bridgetown, Barbados, and at the Imperial College of Tropical Agriculture, St. Augustine, Trinidad. The latter, supported by imperial subsidy and grants from tropical British West African and West Indian colonies, is outstanding.

Finance.—The pound sterling is legally standard except in Trinidad, where the Trinidad dollar is exchangeable at 4*s.* 2*d.* (normally equivalent to the U.S. dollar; 1943 value: 83.4 cents U.S.). The Trinidad or "West Indian" dollar is the most widely used currency in the British West Indies. Trinidad government and bank notes circulate freely through the islands and are legal tender in Grenada, St. Lucia and the Leeward colonies. The Jamaica government and Leewards and Barbados banks issue dollar notes. The normal subsidiary currency is British; only in Jamaica is there a local coinage.

Trade and Communication.—In general 1941 statistics were the latest available with any degree of completeness. During 1943 British West Indian external trade was generally recovering from the sharp disruptions experienced in earlier years, particularly in 1942, but had by no means returned to normal. Trinidad and Tobago, with heavy demands for its oil and other war goods, continued to have a heavily swollen trade. Even there agricultural

Area and Population Estimates, British West Indies

Colony	Area (sq. mi.)	Pop. (latest est.)	Capital (with est. pop.)
Barbados	166	197,956	Bridgetown (70,500)
Jamaica and dependencies			
Jamaica	4,450	1,250,000	Kingston (80,000)
Cayman Islands	104	6,850	Georgetown (1,400)
Turks and Caicos	169	6,500	Grand Turk (1,600)
Leeward Islands			
Antigua (including Barbuda, 62 sq.mi. and Redonda)	171	39,036	St. John's (10,000)
Montserrat	32	13,332	Plymouth (2,000)
St. Kitts-Nevis (St. Christopher, 68 sq.mi.; Nevis, 50 sq. mi.; Anguilla, 34 sq.mi.)	152	38,848	Basseterre (8,000)
Virgin Islands (British)	67	6,720	Road Town (400)
Trinidad and Tobago (Tobago, 116 sq.mi., pop. 31,100)	1,980	506,316	Port of Spain (97,532)
Windward Islands			
Dominica	304	53,202	Roseau (8,000)
Grenada (including Carriacou, 13 sq.mi., pop. 9,358)	133	90,586	St. George's (6,500)
St. Lucia	233	71,232	Castries (9,000)
St. Vincent (including the Lesser Grenadines)	150	61,447	Kingstown (3,900)

export suffered from shortage of shipping space, a factor common to all the islands. Jamaica, normally depending heavily on its space-consuming banana and other bulky agricultural exportation, continued to be hardest hit.

In the five-year prewar period 1934–38, exports for all the British West Indies averaged $64,154,000 value, imports $76,015,000 value, with Trinidad and Tobago accounting for $33,891,000 and $42,924,000 respectively, or well over half, although their population is less than a quarter of the whole. In 1941 external trade, based on incomplete figures, with estimates for the balance, totalled (in Trin. dollars): exports, $47,295,284 and $57,485,563 value respectively. The sharp rise in value represented heavy increase in unit values rather than in volume, which generally declined.

Prewar external trade was dominated by Great Britain, Canada, and the United States, with Great Britain usually leading as a supplier and the United States as a purchaser. Under war conditions both the United States and Canadian proportions tended to increase notably, at British expense. Until 1939 foodstuffs approximated 22% of all import values, textiles, other manufactures and petroleum most of the balance. The principal exports were: sugar and derivatives 32%, petroleum (entirely from Trinidad) 31%, bananas (almost entirely from Jamaica) 17%, with cacao 4½%, spices 2½% and citrous products 2½%. Sugar products made up 90% of Barbadian exports and more than half those of St. Lucia and the Leeward Islands. Wartime emphasis on production for domestic consumption has strongly influenced export production.

External and internal communication is by water and by air. Railways are of consequence only on the largest islands. Trinidad, Antigua and Jamaica are regular calls on the Pan American Airways service. Trinidad itself is one of the leading air transport junctions in the American tropics. During 1943 the K.L.M. (Royal Netherlands Airways) expanded its West Indian service to connect Trinidad and Jamaica directly with Miami, Curaçao and Venezuelan points.

The most important system from the islands' standpoint, however, is the British West Indian Airways, whose service to Tobago, Barbados and Jamaica was extended in 1943 to include most of the more important British Leeward and Windward islands and Miami. During the year, 50% of the B.W.I.A. shares was acquired by the Trinidad government for sale by popular subscription or to such British West Indian colonial governments as might be interested.

Water transportation is inadequate in normal times and has been very seriously affected by war conditions. Interisland maritime communication is by small steamer, motorboat and sail.

Only Jamaica (214½ mi.) and Trinidad (123 mi.) have any railway lines of consequence. Antigua has two small sugar lines (48 mi.), used mainly for freight, and St. Kitts a similar 36-mi. railway.

Except in the two largest islands, highways are scantily developed. Jamaica has the best road network, with 2,458 mi. of parochial roads, suitable for light motor traffic, and 2,301 mi. of cart and bridle roads.

Agriculture.—Nearly all the islands are heavy sugar producers. Barbados, Antigua, St. Kitts and Nevis depend primarily on sugar. In 1942 a total of 432,497 tons of sugar was produced in six colonies (Jamaica 155,262 tons, Barbados 109,042 tons, Trinidad 104,359 tons), of which 50,887 tons was consumed locally. Production in St. Vincent averages around 1,200 tons. A widely varying proportion of sugar cane is converted into molasses and rum. Jamaica is especially important for rum and annually exported about 900,000 gal. in prewar years. Exports declined to 442,003 gal. in 1941 and 415,469 gal. in 1942, but production was understood to have remained normal, with large quantities stored for postwar shipment. In Trinidad sugar-growing suffered a sharp decline, largely because of labour shortage and wartime shipping difficulties. Against 154,218 tons in 1937 and a "normal" of 140,000 tons, it was estimated at 70,000 tons or less in 1943 in the face of ideal weather conditions.

More than 97% of banana acreage, or 72,909 ac. in 1942, is in Jamaica, normally the world's largest banana exporter. In 1938, 23,811,337 stems were exported, but war difficulties reduced the total to 5,588,555 in 1941 and 1,347,324 in 1942. To sustain the industry, an imperial subsidy is given. St. Vincent, St. Lucia, Grenada and Dominica also produce bananas. Cacao is grown especially in Trinidad and Tobago (210,000 ac.) and in Grenada (20,500 ac.) and St. Lucia (4,250 ac.). Coco-nut acreage aggregates in excess of 105,000 ac., half of it in Trinidad and Tobago. Jamaica, however, is the heaviest exporter (1938: 33,415,379 nuts; 1941: 17,134,950 nuts), followed by St. Vincent, St. Lucia and Trinidad. Cotton is important, with some 22,000 ac. planted in 1941, 18,066 ac. in sea-island cotton. St. Vincent, St. Kitts-Nevis, Grenada, Montserrat and Antigua are the leading cotton islands.

Citrus fruits, especially oranges, limes and grapefruit, are grown in most of the colonies. More than half of Dominica's export values are made up by citrous fruit. Jamaica formerly exported oranges and grapefruit extensively, largely to Great Britain, but war conditions compelled a shift to orange pulp. The most important West Indian citrous product is the lime. Dominica, St. Lucia, Trinidad and Montserrat together account for most of the world's lime-juice production.

Arrowroot accounts for half to two-thirds of St. Vincent's export values. This land dominates world production (1941 exports: 11,224,002 lb., valued at £142,992). Spice production is especially important in Grenada, where nutmeg (1940 value: £79,596) and mace (£39,602 value) make up half of export values. Jamaica is the sole source of pimento ("allspice"), with a 1941 export of 3,246,994 lb. (value £151,662), and is an important producer of ginger.

Jamaica's "Blue mountain" coffee is regarded as one of the world's finest. Other varieties, however, are of low quality. In 1941, 18,000 bags (of 132 lb.) were exported. Trinidad (1941: 10,780 bags) produces some coffee.

Mineral Production.—Except in Trinidad, where petroleum and asphalt all but dominate economic life, and in Barbados, where some small petroleum deposits are known to exist, the British West Indies lack mineral resources. No official release is given petroleum-production data in Trinidad. During 1943, however, the industry was reported to be working at full capacity.

Fishing.—Commercial fishing is carried on in all the islands, although frequently on a part-time basis only. The Barbados

government, however, allocated £2,250 in 1943 to aid the industry through loans. Previous loans on a smaller scale had raised the number of commercial fishing boats from 358 to 404.

Manufacturing.—Except for petroleum refining in Trinidad and sugar processing there is little manufacturing. Under war stress, however, government policies have been to encourage local manufacturing, such as cassava milling, wherever possible.

West Virginia. A state in the Appalachian mountain region in the eastern part of the United States. West Virginia was formed from Virginia during the Civil War and admitted to the union June 20, 1863. Area, 24,282 sq.mi. (including 150 sq.mi. of water); population (1940) 1,901,974, of which 1,742,320 were white (41,782 foreign born). Its total urban population was 534,292. Its capital is Charleston (pop. 67,914). Its other chief cities are Huntington (78,836) and Wheeling (61,099).

History.—The chief state officers in 1941–42 were: governor, Mansfield M. Neely; secretary of state, William S. O'Brien; treasurer, R. E. Talbott; auditor, Edgar B. Sims; attorney-general, Clarence W. Meadows. All except the governor were re-elected in Nov. 1940.

Education.—The pupil enrolment (net) in the 4,589 state elementary schools for 1942–43 was 292,608. In the 383 state high schools it was (net) 134,509. The number of teachers was 10,519 in the elementary schools and 5,312 in the high schools. The total state appropriation for elementary and secondary education in 1942–43 was $15,225,000.

The state supports seven teacher-training colleges which in 1942–43 had a total student enrolment of 3,251 and a total instructional membership of 273. It also supports West Virginia university.

Public Welfare, Charities, Correction.—For the year ending July 1, 1943 the total expenditure for old-age assistance was $4,553,337; for the blind, $258,431; for dependent children, $3,942,600. Including the cost of administration, the total cost of public assistance was $9,619,376. The total general relief fund was $3,264,488.

Communication.—In 1942–43 the state had about 4,171 mi. of steam railway (about 6,654 mi. including all sidings), 116.8 mi. of electric railway and an extensive system of improved highways (approximately 16,890 mi., of which more than 10,396 mi. were hard-surfaced). The total mileage of air lines in the state was 750 (450 miles passenger-carrying). The total number of telephones was 199,543 (excluding 3,185 of local unconnected lines).

Banking and Finance.—On June 30, 1943, the total deposits of the 103 state banks and trust companies were $234,274,849. The total deposits of the 77 national banks in the state were $288,633,589. Resources of 22 federal savings and loan associations were $20,547,507. Resources of 37 state building and loan associations were $10,992,139.

State receipts for 1942–43 were $134,203,048; disbursements, $130,399,804; balance, June 30, 1943, $28,193,961. On July 1, 1943, the total state funded indebtedness was $73,963,000. Total state debt, gross, $71,053,000 (net, $65,788,050).

Principal Agricultural Products of West Virginia, 1943 and 1942

	1943 (est.)	1942
Corn, bu.	13,761,000	14,042,000
Wheat, bu.	1,053,000	1,457,000
Oats, bu.	1,722,000	1,848,000
Buckwheat, bu.	216,000	209,000
Hay (Tame), tons	964,000	946,000
Apples, bu.	2,178,000	4,686,000
Potatoes (Irish), bu.	2,850,000	3,808,000
Barley, bu.	209,000	312,000

Agriculture.—Total cash income from farm crops and livestock in 1942 was $64,698,000; income from government payments was $2,595,000. The number of farms by the census of 1940 was 99,282 (acreage 8,908,803), valued at $269,827,285.

Manufacturing.—In 1940, the state had 3,188 reporting industrial establishments, which employed 230,726 persons and paid $396,884,878.99 in wages. These plants had a total production of about $898,722,285.80. The chief industries were steel, glass, chemicals, petroleum refining, stone, potteries and porcelain, cement, lumbering, woodworking and flour.

Mineral Production.—In 1942 oil production was 3,430,000 bbl.; natural gas production was 240,000,000,000 cu.ft.; coal production was 156,742,598 short tons. Total coke production (both bee hive and by-product) was estimated at 3,017,881 in 1943.

Wheat. The 1943 wheat crop of the United States was estimated by the U.S. department of agriculture at 836,298,000 bu., which is 14% less than the 1942 crop of 974,176,000 bu. and 13% greater than the ten-year average, 1932–41. The yield per acre averaged 16.5 bu. which had been exceeded only twice since 1918. The total acreage harvested in 1943 was 50,554,000 ac., slightly more than in 1942 but 4,000,000 ac. less than the ten-year average. Winter wheat production was 529,606,000 bu. with an average yield of 15.6 bu. per acre from 33,952,000 ac. Durum wheat was estimated at 36,204,000 bu. from an acreage about the same as in 1942. All other spring wheat amounted to 276,488,000 bu., a new high record. The acreage 14,472,000 was 24% greater than in 1942 due to the change in government policy in early 1943 when acreage restrictions on wheat were removed.

The great surplus of wheat in the United States which reached a record total stocks of 632,000,000 bu. in 1942 began to disappear rapidly in 1943. Although stocks were still second only to the high record of 1942, in 1943 at 618,000,000 bu. the increased use for feed and alcohol was expected to bring them down to a normal level of about 250,000,000 bu. by July 1944. The unexpected uses which developed in 1942 and 1943 were the demand for wheat for stock feed and for the manufacture of alcohol for rubber and powder. Early in 1943 the policy of the government to limit acreage was suddenly removed and by the middle of the year a 26% increase in acreage for the 1943 crop was proposed. Thus within a little more than a year a burdensome surplus became a very useful reserve supply. The total supply at the beginning of the crop year July 1, 1943 amounted to about 1,453,000,000 bu. compared with 1,613,000,000 bu. in 1942 and 1,328,000,000 bu. in 1941. The total disappearance for all uses, food, feed, industrial uses, etc., was 1,203,000,000 bu. compared with 995,000,000 bu. in 1942 and 696,000,000 bu. in 1941. The estimated amount used for food was above average amounting to 537,000,000 bu. compared with an average of about 480,000,000 bu. for 1933–43. The amount used for feed in 1943 was estimated to be 427,000,000 bu. compared with only 109,000,000 bu. in 1940, and industrial uses took 239,000,000 bu. in 1943 compared with about 100,000,000 bu. average in the prewar periods.

Wheat prices advanced late in 1943 to the highest levels in 15 years. They did not reach the levels of the World War I period however since there was a scarcity of wheat at that time. Loan rates to farmers for 1943 wheat were based on $1.23 per bu., wheat represented 85% of parity at the beginning of the year. Previous years' loan rates were: 1942, $1.14; 1941, 98 cents; 1940, 65.5 cents; and 1939, 64 cents. In November the stabiliza-

Table I.—*U.S. Production of Wheat by States, 1943 and 1942*

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.

tion director authorized a flour subsidy to enable millers to pay parity prices for wheat and at the same time sell flour at ceiling prices. The price of wheat in the principal exporting countries was greatly out of line due to transportation restrictions ranging in November as follows: United States, $1.68 per bu.; Canadian, $1.28; Argentine 81.3 cents; and Australian, 78.2 cents.

World Wheat Production.—The world wheat crop in 1943 was estimated by the U.S. department of agriculture at about 5% smaller than in 1942, not including U.S.S.R. and China. The reductions in Canada and the U.S. were offset by increases in Europe, Argentina, India and Turkey. The Canadian wheat crop was about 294,000,000 bu., much below the 557,000,000 bu. crop of 1942 though near the prewar average of 309,000,000 bu. per year. Mexico produced only 14,000,000 bu. compared with 16,000,000 bu. in 1942. Europe as a whole, 30 countries, produced about 1,540,000,000 bu. which was near to the ten-year average, 1932–41. The axis countries increased acreage and were favoured with good growing conditions. Droughts somewhat reduced yields in Portugal, Spain and southern France. Prospects in Argentina indicated a record crop while Australia had reduced prospects at the end of 1943. In all countries the governments proposed increases in acreage in 1944 to meet an anticipated increased demand as hostilities cease. World exports of wheat and flour were reduced to less than 400,000,000 bu. in 1943 compared with 638,000,000 bu. in 1938–39, the last prewar year. The total stocks in the four large exporting countries, United States, Canada, Argentina and Australia, were expected to exceed 1,200,000,000 bu. in 1944 which would be ample to meet all expected demand. Wickard, Claude Raymond (1893–), U.S. secretary of agriculture, was born near Delphi, Ind., on Feb. 28. After his graduation from Purdue university in 1915 he took over management of a farm near his birthplace. In 1933 he was appointed to the staff of the Agricultural Adjustment administration as assistant chief of the corn-hog division. On Feb. 1, 1940, he was appointed under-secretary of agriculture, and on Aug. 19, after the resignation of Henry A. Wallace, President Roosevelt nominated him secretary of agriculture. In March 1941, Wickard took charge of the production and distribution of food to Britain and her allies under provision of the lend-lease act. He pressed the "food for freedom" program with vigour, stressing the need of increased production for lend-lease aid to Britain. On Dec. 6, 1942, President Roosevelt made Wickard war food administrator. On March 25, 1943, however, the president named Chester C. Davis to the position, stipulating that he report to Wickard. The arrangement did not work. Davis resigned three months later; Marvin Jones succeeded him. An advisory committee, named by Wickard to study the tangled situation, pointed to the "maze of committees, agencies, directives, cross-purposes, jealousies, etc." No basic organizational changes were made. On Oct. 29, the president named Wickard "neutral chairman" of the United Nations' war food board.

Widener, Joseph Early (1872–1943), U.S. turfman and art collector, was born Aug. 19 in Philadelphia, and attended the University of Pennsylvania and Harvard. From his father, P. A. B. Widener, he inherited an immense fortune and a priceless art collection. The younger Widener, who also acquired his father's interest in art, added to the collection many paintings of the old masters, tapestry, sculpture, rare porcelains, jewels and crystals. In 1942, he presented the entire collection, variously estimated as worth between $15,000,000 and $50,000,000, to the National Gallery of Art in Washington. Widener was also possessor of three famed racing stables. He was principal owner of the Belmont Park race track and the Hialeah Park race track. Widener died in Elkins Park, Pa., Oct. 26.

Wigmore, John Henry (1863–1943), U.S. educator, was born March 4 in San Francisco. He took his law degree from Harvard in 1887, practised law for two years and then accepted an invitation to join the law faculty at Keio university, Tokyo. Dr. Wigmore later returned to the United States and from 1893 until his retirement in 1929, was associated with Northwestern University's Law school. He began as professor of law and was dean from 1901 to 1929. Dr. Wigmore won international honours for his contribution to international jurisprudence. He founded and was a former president of the American Institute of Criminal Law and Criminology, served on numerous committees and commissions, was a member of the Illinois Commission on Uniform State Laws and published the Modern Criminal Science series, 1910–15. He was also the author of *Treatise on Evidence* (10 vols.), 1904–05, 1923 and 1940. During World War I, he helped frame the National Draft law and later served on the staff of the judge advocate general. In 1930, his name was mentioned for a seat on the Permanent Court of International Justice. Dr. Wigmore died in Chicago, April 20.

Wild Life Conservation. Wild life conservation in the United States in 1943 was characterized by a wartime curtailment of many normal activities, an interruption of long-time programs, and the direction or redirection toward war objectives of nearly all the operations and programs that were continued or undertaken. There was, however, some attention paid to the development of postwar programs that would help meet anticipated economic and social objectives of the nation and at the same time provide for a better preservation and wiser utilization of wild life resources. There

were also evidences of a continuing public interest in wild life and its conservation, and conservationists—including administrators of public programs—continued to advocate, with encouraging responses, the principles that guided their peacetime programs. Some tendencies toward exploitation were combated, but conservationists were in general disposed to consider the year in retrospect as one of encouraging accomplishments. The conservation "movement" had remained mobilized, and its agencies for action had continued to function. The effects of war had not been so severe as had been feared. And, with hopes for the future, this result was attributed in part to the fact that the fears had been faced with vigilance and with determination to overcome their causes.

The Eighth North American Wild Life Conference—the 1943 meeting in a series that had established itself as the outstanding forum for wild life conservationists—was held in Denver, Colo., Feb. 15 to 17, with 424 registered in attendance—85 more than had met in Toronto in 1942. Sponsored by the American Wildlife Institute, the conference, according to J. Paul Miller, secretary of the institute, "helped to maintain an active interest in the conservation of our natural resources at a time when there was a very decided tendency to consider wild life and related problems of minor significance." Demands for ammunition to be used by hunters were co-ordinated at the conference, contributing to the later government action making limited supplies so available. As at earlier annual conferences many and various aspects of wild life conservation were discussed both in technical and general sessions, yet the demands for ammunition and the pointed emphasis in connection with them on increases in wild life populations and on the food values of game received greatest attention by the public.

These questions became the issues in one of the year's characteristic discussions among conservationists. Regarding the reports of wild life abundance and even in local areas overabundance, *Nature Magazine,* published by the American Nature association, declared, for example: "Recent years have seen a generally successful program of building up stocks of some wild life species while continuing the shooting of most species. In the case of only a few species, and then only locally, have we had too much wild life. Less hunting and wise hunting for the duration will unquestionably speed the recovery of many reduced species. In any cases of overabundance, the surplus can be removed in a properly supervised fashion."

Emphasizing the food values of wild life was criticized as weakening "the lock on the door that has been closed on the commercialization of game by conservationists and all good sportsmen," and such emphasis was opposed by some conservationists by minimizing the importance of this food supply. Referring to the federal estimate that "during the 1942–43 season, hunters took 255,404,000 lb. of usable meat for home consumption," the director of the National Audubon society, for example, pointed out in *Audubon Magazine* that "any such poundage of meat as 255,000,000 is but an inconsequential drop in the bucket by comparison with the poundage of meats available from domestic livestock."

The issues relating to the large numbers of wild life in local areas—particularly big game on federal public lands—were debated with special reference to a bill introduced in congress by Senator Pat McCarran of Nevada to extend federal control over wild life. The bill would have made it possible for administrators of federal lands to advise state officials to reduce game numbers in specific areas, or to effect the reductions themselves and dispose of the meat. Fearing possibilities for commercializing game, many conservation groups opposed the bill, a number of public hearings were held, and early in December Senator McCarran announced a withdrawal of his own support of the bill, declaring that its major purposes had been accomplished in focusing attention on the problems involved and bringing about co-operative federal-state action to meet the needs for reducing excessive populations.

The general wartime food situation did, however, give added importance to the table value of game, and the hunting limitations imposed by difficulties in transportation and relaxation made wild life increases seem more conspicuous. These increases were considerable. Waterfowl numbers, which in 1934 had been below 30,000,000, were estimated in the spring of 1943 to have increased to between 115,000,000 and 120,000,000, and there followed a favourable breeding season. Big-game animals, numbering about 6,748,000 at the close of 1941, according to the latest estimates compiled by the fish and wildlife service, were also increasing. The numbers of upland game birds were likewise believed to have been augmented, partly as a result of the federal aid in wild life restoration program, which though reduced in scope by war conditions continued to function.

Legal regulations of hunting were little changed. The migratory-bird hunting regulations—the only federal rules applied throughout the country—did lengthen the shooting day by allowing hunting to begin a half-hour before sunrise, but the 70-day seasons on waterfowl were continued and only slight adjustments were made in other provisions. No general conspicuous trends were noted in the state regulations of other game hunting. Widespread efforts were made to salvage for war use the fat, tallow, feathers and hides of game.

The extent of hunting in the United States was indicated by the fish and wildlife service's estimate that in 1942 the take of game birds and mammals was more than 141,000,000. This estimate included 614,000 deer, 34,000 elk, 9,000 antelope, and smaller numbers of other big game species. The bag of upland game, including rabbits, squirrels, raccoons, opossums and woodchucks was estimated at more than 71,000,000 and that of upland game birds—quail, pheasants, grouse, and the like—at more than 41,000,000. The take of waterfowl—mostly ducks—was 16,700,000, and of other migratory game birds, 11,518,000, according to these estimates.

No estimates were available at the close of the year regarding the number of hunters in 1943, the latest compilations being those for the seasons of 1941–42, when 8,532,354 hunting licenses were issued—607,532 more than in the preceding year. In the comparable period 8,423,218 fishing licenses were reported, many of these being issued to sportsmen who also purchased hunting licenses.

Fishing not only for sport but for food was promoted during the year, with attention to the needs for conservation, by the continued encouragement of "farm fish ponds," 3,000 of these having been built and stocked during the year ended June 30, 1943, by the fish and wildlife service in co-operation with the soil conservation service and at least an equal number already in existence having been stocked with sunfish, crappies, catfish and other pondfish, despite the closing of 12 federal fish hatcheries since Pearl Harbor.

In 1942, requisitioning of fishing boats by the navy and the army, shortage of materials for new boats, enlistment of fishermen in the navy and merchant marine, and shortages of rope, twine and fish-net materials resulted in a decline of more than 1,000,000,000 lb. in the yield from United States commercial fisheries—from a 5,000,000,000-lb. catch in 1941. The Office of the Co-ordinator of Fisheries was established to cope with these problems, and in Dec. 1943, the fish and wildlife service reported: "The commercial fisheries have shown a steady comeback in production from the low point which resulted from the

first impact of war on the industry."

BIBLIOGRAPHY.—Among the most encouraging indications of continued public interest in wild life conservation was the year's output by book publishers. *Wildlife Refuges,* by Dr. Ira N. Gabrielson, director of the fish and wildlife service, the first book-length discussion on this subject, provided not only a history and an authoritative explanation of policies but also described the refuge systems of North America and assembled statistical information. *The Ducks, Geese and Swans of North America,* by Francis H. Kortright, with illustrations by T. M. Shortt (300 in color), published by the American Wildlife institute, was received as the best single volume on its subject. *The Mammals of Eastern United States* by William J. Hamilton, Jr., published by the Comstock Publishing company, provided a reading and reference work comparable with regional bird books, and *Meeting the Mammals,* by Victor H. Cahalane (Macmillan), with excellent illustrations by Walter A. Weber, dealt with national park areas west of the Mississippi. *The American Land: Its History and Its Uses,* by William R. Van Dersal (Oxford University press), synthesized a wealth of information about agricultural and other rural and wild land uses into a volume useful, interesting, inspiring and provocative. *Extinct and Vanishing Mammals of the Western Hemisphere with the Marine Species of All the Oceans,* an authoritative 620-page treatise by Glover M. Allen, dealing not only with extermination but also with possibilities for saving species now threatened, was published by the American Committee for International Wild Life Protection.

The principal source for current and other information on wild life in the United States was the fish and wildlife service (both a research and an administrative agency), United States department of the interior, Merchandise Mart, Chicago, Ill., which had available lists of federal publications and compilations, including a newly revised list of national, international and state officials and organizations. Among private organizations were the American Nature association, 1214 16th st., Washington, D.C.; the American Wildlife institute, Investment building, Washington, D.C., sponsor of co-operative research projects, special investigations, the annual continental wild life conferences, and monographs; the Izaak Walton League of America, Inc., 2801 South Halsted st., Chicago, Ill., concerned with conservation in general but particularly active in promoting improved streams and waters; and the National Audubon society, 1006 Fifth ave., New York, N.Y., sponsor of nature education programs, publications, an annual Christmas bird census, and sanctuaries. Scientific periodicals published during the year included the *Journal of Wildlife Management,* the *Journal of Mammalogy,* and *The Auk: A Quarterly Journal of Ornithology.* (H. Z.)

Wiley, Henry Ariosto (1867–1943), U.S. naval officer, was born Jan. 31 in Troy, Ala. A graduate of Annapolis Naval academy, 1888, he saw service in the Spanish-American War and prior to World War I had command of various battleships. He was attached to the Sixth Battle squadron of the British Grand fleet with temporary rank of rear admiral, 1918, and after the war, was commander of destroyers with the U.S. Pacific fleet, 1919–20. He was made a vice admiral, 1923–25, and was later commander of the United States fleet with rank of admiral, 1927–29. Although he retired in Sept. 1929, he was called back to serve on the Maritime commission, 1936–40, and later headed the Navy Board for Production Awards. He was the author of an autobiography, *An Admiral from Texas* (1934). He died in Palm Beach, Fla., May 20.

Wilhelmina (WILHELMINA HELENA PAULINE MARIA OF ORANGE-NASSAU) (1880–), queen of the Netherlands, daughter of William III, king of the Netherlands, and Queen Emma, was born Aug. 31, 1880. She succeeded to the throne in 1890, under the regency of her mother, and was enthroned in 1898. She married Henry, duke of Mecklenburg-Schwerin (d. 1934), in 1901, and in 1909 Princess Juliana, heiress to the throne, was born.

When Germany invaded the Netherlands May 10, 1940, the royal family with members of the government sought refuge in London. Princess Juliana, who in 1937 had married Prince Bernhard Leopold of Lippe-Biesterfeld, left subsequently for Canada with her two daughters, while Prince Bernhard remained in England with the queen. On May 13, 1940, Queen Wilhelmina proclaimed that the seat of government of the Netherlands had been transferred to London.

During 1943 Queen Wilhelmina continued to maintain contact with the occupied Netherlands by broadcasting and by receiving personally all those who escaped. In August she appointed a recent arrival from the Netherlands, J. A. W. Burger, as minister without portfolio, to direct plans for the return of the government. In May, Queen Wilhelmina visited Canada and inspected Dutch troops stationed there. She also visited the United States and spent a week-end at the residence of President Roosevelt. In August she opened Netherlands house in London as a meeting place for British and Dutch people, run under the joint auspices of the British council and the Dutch government. She was presented on Oct. 15 with the degree of doctor of law, *honoris causa,* at the university of Oxford. (G. J. R.)

Willkie, Wendell Lewis (1892–), U.S. attorney, business executive and politician, was born Feb. 18 in Elwood, Ind. After being graduated from the University of Indiana with an A.B. degree in 1913, he taught history in the high school at Coffeyville, Kan. In 1916 he received his law degree from the University of Indiana and joined his father's law firm in Elwood. During World War I he was a captain in the 325th field artillery in France. In 1929 he joined the legal staff of Commonwealth and Southern, a large utilities holding company. Four years later he was president of the company.

His nomination for the presidency by the Republican convention June 28, 1940, was described as a political "miracle." He was defeated by a substantial margin in the election of Nov. 5, 1940, although he received 22,333,801 votes.

In the late summer of 1942, Willkie made a world tour as special representative of President Roosevelt, visiting Churchill, Stalin and Chiang Kai-shek. His book, "One World," based on this trip, was published in April 1943, and immediately climbed to the top of the best-seller lists. His attitude on foreign policy, expressed shortly after his tour, was objectionable to many Republicans and threatened to turn the party against him. He was late in 1943 one of the leading candidates for the 1944 Republican nomination for the presidency.

Wilson, Charles Edward (1886–), U.S. industrialist, was born Nov. 18 in New York city. After a meagre grade school education, he went to work when he was only 12 years old as a shipping clerk with the General Electric company. He worked his way up through the ranks until he became president of the organization on Jan. 1, 1940. Wilson was selected by Chairman Donald Nelson for the post of vice-chairman of the War Production board in full charge of production, Sept. 17, 1942. Soon a policy dispute developed between Wilson and Ferdinand Eberstadt, vice-chairman in charge of materials. On Feb. 16, 1943, Chairman Donald M. Nelson removed Eberstadt, transferring his duties to Wilson, who thereupon became executive vice-chairman. On Nov. 12, 1943, shortly after Nelson's return from a European tour, Wilson, believing the production battle to be substantially won, resigned to return to the General Electric company. Nelson accepted his resignation, but Byrnes and Roosevelt declined to do so. Wilson stayed on with WPB. Bernard Baruch commented: "The agencies that wound up the U.S. economy for war should unwind it."

Wilson, Sir Henry Maitland (1881–), British army officer, was educated at Eton and received a commission in the Rifle brigade in 1900. Before he was 20 he was on active service in South Africa. During World War I he fought in France and Belgium, serving both with his regiment and on the staff. After the war, he held appointments at the Royal Military college, Sandhurst, and the Staff college, Camberley. In 1938 he was promoted lieutenant-general and was sent to command Britain's army of the Nile in 1939. There, under General Wavell, he directed the advance which, covering 450 mi. in 57 days, swept the Italian forces from Cyrenaica. After this campaign General Wilson was made G.O.C.-in-C. and military

governor of Cyrenaica. A few weeks later he was leading the United Kingdom and Empire troops under the orders of General Papagos in Greece. On a front of 60-70 mi. in eastern Greece he was faced by overwhelming German forces which, having broken through the Greek troops on his flank, seriously threatened to surround his little army. By skilful leadership he was able to extricate much of the greater part of his force in accordance with the expressed wishes of the Greek government. After this, in June–July 1941, in a campaign lasting only five weeks, he led the Allied forces which thwarted Vichy's support for a projected Nazi *coup d'etat* in Syria. In Aug. 1942 he was appointed the first commander-in-chief, Persia-Iraq. In Feb. 1943 he returned to Egypt to become commander-in-chief, middle east, in succession to General Alexander.

Winant, John Gilbert (1889–), U.S. diplomat, was born Feb. 23 in New York city. He attended Princeton university and in 1912 became a teacher of English and assistant rector at St. Paul's school. In 1917 he entered the United States air service, becoming captain of the 8th observation squadron in France. After the war he was elected to the New Hampshire legislature, serving in both the house and the senate between 1917 and 1923. In 1925 he was elected for the first of his three terms as governor of New Hampshire. From 1935 to 1941 he was assistant director, then director, of the International Labour office. He resigned from this post to accept Pres. Roosevelt's appointment as ambassador to Great Britain, Feb. 6, 1941. In Dec. 1942 Winant arrived in Washington for a series of conferences, remaining through March, when he took part in the meetings between Pres. Roosevelt and Anthony Eden. In October he signed, in London, a mutual lend-lease agreement between the U.S., Britain, Canada and the U.S.S.R.

Windward Islands: *see* WEST INDIES, BRITISH.

Wines. In spite of the world war which raged in most of the wine growing countries of Europe, the gathering of grapes and making of wine continued in 1943. Official figures were impossible to obtain from any of the European countries except Spain and Portugal, but from unofficial but reliable sources it was learned that the 1943 vintage was most satisfactory in so far as quantity is concerned and, in general, very satisfactory in quality in Austria, Hungary and France. No information of the German vintage was available, but from Italy it was learned that the vintage took place in the liberated territory, in many instances even while the towns adjacent to vineyards were under bombardment. It was not known whether or not it was possible to make wines in the central and northern parts of Italy (still under German domination in 1943) which normally produce the major portion of the Italian crop.

Because of unusually fine weather, the vineyards in the Bordeaux district of France were free from disease in spite of the lack of sulphate of copper with which the vines are usually sprayed. Unofficial reports indicated that the vintage was 50% greater in 1943 than in 1942, and that the quality was outstandingly fine. No reports were received from the burgundy or champagne districts, but it was known that the vineyards in the burgundy district were not short of labour and that the vintage took place at the usual time.

In Spain the weather during the vintage was favourable, but excessive heat in July and August caused considerable damage to the vineyards and greatly reduced the crops in the Jerez, Puerto and Sanlucar districts. Just as in the U.S., there was also a greater consumption of grapes for eating purposes in Spain in 1943 than in previous years, and in the southern part of Spain, therefore, the total output of wines was about 60% of normal. The wine was of exceedingly good quality, the grapes having had a high sugar content and the alcoholic strength in consequence was higher than usual. In the central and northern parts of Spain the vintage was, like the Bordeaux vintage, above the average in quantity and in good quality. In Malaga on the south coast, and in Tarragona on the east coast, there was extremely good weather during the vintage, and there was better than a normal crop both in quantity and quality.

In Portugal the weather was, up to the end of July, most favourable resulting in a prolific budding of the vines. However, extreme heat in August and early September made an early vintage necessary and while the grapes had an excessive amount of sugar, the quantity produced was not as great as had been expected. The final result was a normal vintage in quantity, and extremely good quality. The government office in control of vintage authorized the production in 1943 of 50,000 pipes of port wine, the balance of the wine being fermented out for use as table wine.

In Algeria and Tunisia the yield was less than 50% of the average, the quality on the whole was inferior, and there was a great scarcity of white wines. The whole vintage in Algeria was blocked at the wineries by government order on the ground that the wines would be required for export to France. The lack of sufficient sulphur over a period of years seriously endangered the future of the Algerian vineyards.

In Australia the production was approximately 20% above normal with the quality good. The demand for Australian wines, particularly in Great Britain, was large but lack of shipping facilities prevented the growers from taking full advantage of the improved markets for their wines. Statistics from South Africa were not available.

In the western hemisphere there was an increase in production both in Chile and in Argentina. In Argentina the grape crush was the largest that it had ever been, with a resulting production of 10,661,756 hectolitres, or approximately 50% more than in 1942. Of this production (285,635,000 gal.) approximately 90% were table wines, quality being generally better than in 1942. In Chile, the vintage was considerably larger than in 1942, the production amounting to 2,710,200 hectolitres, equivalent to 72,633,360 gal. The quality was somewhat better than in 1942.

In the United States, the official figures were not released by the close of 1943, but estimates were, that the production was 25% to 30% heavier than in 1942. In California alone, which furnishes approximately 90% of the production of the United States, approximately 775,000 tons were crushed in 1943 as against 600,000 tons in 1942, producing from 75,000,000 to 80,000,000 gal. against 54,000,000 gal. in 1942. The grape crop was the largest in history, approximately 2,600,000 tons of all varieties of grapes, making the 1943 grape crop in California worth approximately $159,557,000. The figure for the first time made grapes the most valuable of all fruit crops in California. Quality was excellent.

In other states, qualities were also excellent, but production considerably below the average, and considerably below that of 1942. The 1943 consumption was estimated at between 80,000,000 and 90,000,000 gal. as against 112,000,000 gal. in 1942. (*See* also LIQUORS, ALCOHOLIC.) (O. J. W.)

Wisconsin. One of the north-central states, Wisconsin, popularly called the "Badger state," entered the union in 1848. Area, 56,154 sq.mi., of which 54,715 sq.mi. are land. The federal census of 1940 gave its population as 3,137,587, an increase of 6.8% over 1930, but the estimated civilian population on March 1, 1943 was 2,956,860, a decrease from 1940 of

5.7%. The urban population in 1940 was 1,679,144 and the rural, 1,458,443. Only 24,835 were non-white. Foreign-born whites numbered 288,774. Capital, Madison (pop. 1940, 67,447). The largest city, Milwaukee, had a population of 587,472, and other large cities are Racine (67,195), Kenosha (48,765), Green Bay (46-235), La Crosse (42,707) and Sheboygan (40,638).

History.—The legislature, urged by the acting governor to put Wisconsin on a war footing and to set aside the money pouring in from the income tax for postwar construction and rehabilitation of war veterans, passed 566 acts in a session of 8 months during 1943. Though legislature and acting governor were both Republican, 21 of his 36 vetoes were overridden, one more than the total number overridden in the entire previous history of the state, and the legislature insisted upon reconvening on Jan. 12, 1944.

Yet much of the acting governor's program was obtained. The 60% emergency surtax on incomes was not reenacted, but its yield for 1942 ($6,300,000) was set up as a postwar rehabilitation trust fund to provide medical, educational and economic rehabilitation for returning war veterans. A state trunk highway fund, estimated to contain $17,450,000 by the end of the 1943–45 biennium, was created for the purposes of postwar construction. The Wisconsin state council of defense was reorganized, and R. S. Kingsley was replaced as its chief by John Cudahy, who, on his death, was succeeded by G. R. Howitt. The state Civil War debt of $1,183,700 was retired. Unemployment insurance contribution rates as well as payments were increased, as were workmen's compensation payments. State aid to high schools was raised from $1,385,000 to $3,500,000 yearly. State civil service employees were voted a cost-of-living bonus, a pension-retirement plan, and a regulated system of annual increases. A controversial bill requiring all attorneys to be members of the state bar of Wisconsin was passed over a veto and upheld by the supreme court.

The state officers in 1943 were all Republican: W. S. Goodland, acting governor; F. R. Zimmerman, secretary of state; J. M. Smith, treasurer; J. E. Martin, attorney general; and John Callahan, superintendent of public instruction. The chief justice of the supreme court was M. B. Rosenberry.

Education.—There were 6,879 elementary schools, 462 secondary schools and 9 teachers' colleges in 1941–42. The enrolment was 361,599 in elementary schools and 158,248 in secondary schools. There were 15,312 elementary school teachers and 5,924 secondary school teachers.

Public Welfare, Charities, Correction.—The number of cases receiving public assistance as of June 1943 was as follows: general relief 8,669; old age assistance 50,495; aid to dependent children 8,034; aid to blind 1,728—a total of 59,478 households. Expenditures for public assistance in the year ending June 30, 1943, were as follows: general relief $4,791,307; WPA $5,537,673; old-age assistance $15,544,138; aid to dependent children $5,049,708; aid to the blind $539,470; and administration of the last three items, $938,630—a total of $32,400,926. Unemployment benefit payments in 1942 were $4,119,562 as against $2,927,466 in 1941. The contributions for 1942 were $18,857,125; for 1941, $13,509,273. Wisconsin's 17 charitable, penal and allied institutions were operated in the year ending June 30, 1942 at a cost of $3,998,357 (less fees, repairs, etc.). The average daily population for June 1943 was 20,254.

Communication.—The number of miles of highways as of Jan. 1, 1943, was 84,937 (towns), 2,392 (villages) and 5,899 (cities). The total was 93,228 mi. The expenditure on highways during July 1942–June 1943 was $28,689,086. The total railway mileage on Jan. 1, 1942, was 6,617. The number of airports was 58. On Jan. 1, 1943, there were 612,048 telephones.

Banking and Finance.—At the end of 1942 there were 466 state and 98 national banks. The number of credit unions was 595. The deposits in state banks totalled $671,643,860; the assets were $737,528,685. National banks had deposits of $779,289,000 and assets of $839,466,000. The credit unions listed assets of $13,875,599. There were 120 building and loan associations with assets of $113,861,795.

The state receipts during the fiscal year ending June 30, 1943, were $141,028,304. The disbursements were $129,122,687. The state had no outstanding indebtedness in 1943. The state budget for state departments (excluding state aid to local units) for the biennium 1943–45 was $72,701,405, but appropriations of $9,108,595 were made in addition to the Executive Budget act.

Agriculture.—The total acreage harvested in 1942 was 9,009,000. The gross farm income was estimated at $615,171,000, consisting of $67,426,000 from crops and $547,745,000 from livestock and its products, including $289,376,000 from milk. The total was an increase of 31% over 1941 and was 17% above the previous high year (1919). This increase was partially caused by prices, which were 166% of the 1910–14 average, but production of farm products was the highest ever achieved in Wisconsin. The land used in producing cash crops was small compared with the land used for feed crops, a result of the state's great dairy industry.

Table I.—*Leading Agricultural Products of Wisconsin, 1943 and 1942*

Crop	1943 (est.)	1942
Corn (bu.)	109,968,000	103,544,000
Oats (bu.)	102,180,000	100,577,000
Canning peas (lb.)	257,080,000	260,480,000
Tobacco (lb.)	28,230,000	29,200,000
All tame hay (tons)	7,025,000	7,513,000
All clover and timothy (tons)	4,585,000	4,291,000
Alfalfa (tons)	2,132,000	2,859,000

Manufacturing.—The total value of Wisconsin manufactured products in 1939 was $1,604,507,356. The wages paid were $251,946,993. The number of wage earners was 200,897 (average for the year). Wisconsin, with an extremely diversified industry, ranked first in the manufacture of cheese, milk products, malt and canned peas in 1939.

Between June 1940 and Sept. 1943, Wisconsin manufacturers received $3,507,019,000 in major war supply and facility contracts. In 1942 the estimated average number of wage earners in Wisconsin manufacturing establishments was 312,700 and the estimated weekly payrolls, $11,928,000.

Table II.—*Value of Mineral Products of Wisconsin, 1941 and 1940*

Mineral	1941	1940
Stone	$5,666,120	$5,030,263
Iron ore	3,998,287	3,290,389
Sand and gravel	3,398,039	2,304,107

Mineral Production.—In 1940, the last year for complete figures as of 1943, the total value of mineral production was $13,554,000 compared with $12,704,942 in 1939. (E. P. A.)

Wisconsin, University of.

An institution of higher education at Madison, Wis. More than 1,600 students received degrees at Wisconsin's June 1943 commencement, the 90th in the university's 93-year history.

Up to Nov. 1943, the university had trained 7,520 young men and women for the U.S. armed forces. Still in training at the university were 1,000 sailors and 250 WAVES in radio code and communications; 140 naval aviation cadets; 450 naval engineering students; 1,000 soldiers under the army specialized training program; 175 army and navy medical students; 100 officers in

the Civil Affairs Training school; and 16 WACS being trained in physiotherapy. The university also continued as the centre of the Institute of Correspondence study for both the army and navy, with more than 70,000 registrations received from soldiers and sailors in all parts of the world by Nov. 1943.

Under the federal engineering, science, management war training program, the university continued its operation of 500 classes, enrolling more than 10,000 students in 966 Wisconsin businesses and industries in 37 cities of the state for special training in war industries to speed production.

For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (R. Fs.)

Withholding Tax: *see* TAXATION.

WLB: *see* WAR LABOR BOARD, NATIONAL.

Woman's Christian Temperance Union, National.

During 1943 the Department of Work for Soldiers and Sailors, which had been carried on in peace as well as wartime, continued to be augmented. The W.C.T.U. had by 1943 sent to the Red Cross as one of its contributions more than $32,000 to purchase ambulances, mobile blood bank units, mobile canteens, station wagons and clubmobiles. A "Safety School on Wheels," aptly renamed a "Physical Fitness Clinic," toured the camps for its third season during the year, bringing entertainment and helpful drills and information to the service men.

The two specific aims of the W.C.T.U., protection of the home and abolition of the liquor traffic were actively carried on. Juvenile delinquency, women drinking, support of and extension of education continued to receive special attention.

In 1943, 48,324 new members enrolled, and there was a total of 728 new organizations. The national officers for 1943–44 were: president, Mrs. Ida B. Wise Smith, Evanston, Ill.; vice-president, Mrs. D. Leigh Colvin, New York city; corresponding secretary, Miss Lily Grace Matheson, Evanston, Ill.; treasurer, Mrs. Margaret C. Munns, Evanston, Ill.; recording secretary, Mrs. Nelle G. Burger, Springfield, Mo. (I. B. W. S.)

Women's Airforce Service Pilots.

Women's Airforce Service Pilots (WASP), civilian pilots with the United States army air forces, began operations and training under the army air forces in the fall of 1942 with a nucleus of about 50 pilots. There were approximately 1,000 in 1943.

WASP operations were at first limited to the ferrying of light liaison and training craft from factory to airfields within the United States. The first ferrying squadron was known as the WAFS (Women's Auxiliary Ferrying Service). Although the greater number in 1943 still flew the lighter craft, the WASP also ferried all types of U.S. military planes in domestic use, within the United States and Canada. They were also engaged in other noncombat operations, such as target-towing, courier duty, tracking and testing.

WASP training in 1943 was concentrated at Avenger field, Sweetwater, Texas. Approximately 100 were enrolled each month as the same number were graduated and assigned to operations under various commands of the air forces.

Recruits in 1943 had 35 hours' flying time and were between the ages of 18½ and 34.

Miss Jacqueline Cochran was director of women pilots on the army air forces in 1943.

The WASP in 1943 were on civil service status; trainees received $150 per month base pay; the graduates, assigned to operations, $250. In Nov. 1943, the official uniform of the WASP was designated as a jacket and skirt of blue gabardine, a beret of the same material and a white cotton shirt with black tie. (H. TA.)

Women's Army Corps.

The Women's Army corps (originally known as the Women's Army Auxiliary corps) was created by act of congress in public law No. 554, dated May 14, 1942.

Members of the corps in 1943 performed noncombatant duties of an administrative nature in zones of operation as well as in the United States. Nomenclature for grades originally differed from that of the army, but equivalent pay was provided after the corps had been in existence six months by a pay equalization bill enacted by congress and signed by the president on Oct. 26, 1942. Mrs. Oveta Culp Hobby continued as the corps director in 1943.

Public law No. 110 was passed by congress and signed by the president on July 1, 1943, making the WAAC the Women's Army corps (WAC), and on July 5, 1943, Director Hobby was sworn in to the army of the United States with the rank of colonel. With this new legislation members of the WAC became eligible for government insurance rates, free mailing privileges, overseas pay, dependency allotments, and other army privileges. Though still a noncombatant organization, the new status made it possible for WAC officers to take over operational and staff jobs in the army.

At the end of 1943 Wacs were doing 155 specific army jobs with general classifications including medical, personnel, science, photography, languages, drafting, communications, mechanics, radio, clerical, textiles, food, supply and many others.

Grades and pay scale for members of the WAC, like those of the men in the army, are as follows:

WAC Officers

Grade	*Monthly base pay*	*Grade*	*Monthly base pay*
Colonel (Director)	$333.33	Captain	$200.00
Lt. Colonel	291.67	1st Lieutenant	166.67
Major	250.00	2nd Lieutenant	150.00

WAC Enlisted Women

Grade	*Monthly base pay*	*Grade*	*Monthly base pay*
Master Sergeant	$138.00	Corporal	$66.00
Tech. Sergeant	114.00	Private 1st Class	54.00
Staff Sergeant	96.00	Private	50.00
Sergeant	78.00		

In 1943, as was true from the beginning of the WAC training program, all members took basic training corresponding to that given male army trainees, with the exception of those courses dealing with weapons and military tactics. Enlisted members received specialist training in army administration, motor transport, bakers and cooks schools, communications, medical, surgical and dental technicians schools, army finance, and other courses of study. Officers came up from the ranks of enlisted women and were given an intensive officer candidate course before they were commissioned. Courses in various army officer specialist schools such as the Adjutant General's school, the Ordnance school, Special Services school and many others were opened to WAC officers also.

Limited at first to 25,000, the corps was increased by executive order to 150,000 on Nov. 20, 1942, to meet the demands by various branches of the service for WAC personnel.

On Aug. 4, 1943, another executive order authorized the strength of the Women's Army corps not to exceed 200,000 members.

Women's Auxiliary Ferrying Service: *see* WOMEN'S AIRFORCE SERVICE PILOTS.

Women's Clubs, General Federation of.

The General Federation of Women's Clubs in 1943 sponsored a campaign to place 20,000 student nurses in training. Individual clubs provided many students recruited with gift scholarships of approximately $250. In the year the scholarship fund totalled over $200,000. Selling war bonds to provide a fleet of bombers —composed of one from every state federation and others from district federations and clubs, each bearing the name of the group making it possible—was another 1943 objective. The bomber campaign fund totalled over $60,000,000.

Following a visit to state conventions throughout the U.S., Mrs. John L. Whitehurst, federation president, inaugurated a nation-wide campaign to reduce juvenile delinquency through co-operation of law-enforcement and welfare agencies, and the provision of worth-while spare-time activities for youth. Other important programs of the year included salvage drives; conservation and rationing programs; nutrition classes; nurses' aide, first-aid and home nursing courses; gardening and canning; recruitment of labour for farms and industry; recruitment of WACS, WAVES, SPARS, WAFS and marines; extension of Pan-American scholarships; and a study of peace and postwar planning.

In July and August, the federation president spent five and a half weeks in England, as the guest of the British government, studying war conditions, social problems and women's activities.

The legislative program included a concerted effort for renewal of the Reciprocal Trade Agreements act, for which the federation had been on record since 1938. One hundred leaders of the organization met in Swampscott, Mass., in June, to report war service activities, plan further projects and discuss peace and postwar planning. In 1943 the federation comprised 16,500 clubs in the United States and 30 foreign countries, with a total membership of more than 2,500,000 women. Headquarters are maintained at 1734 N street, Northwest, Washington, D.C.

(S. A. W.)

Women's Reserve of the Navy.

Members of the women's reserve of the United States naval reserve, popularly known as WAVES, were serving during 1943 in every bureau of the navy department and at shore stations in every naval district within the continental limits of the United States. Established by act of congress in July 1942, the women's reserve had grown to a membership of 47,600 by the end of 1943, and the goal for the end of Dec. 1944 was set at 92,400 women. Training facilities were increased during 1943 to meet the enlarged demands of the naval service.

Since Feb. 1943, recruit training had been concentrated at the Naval Training school, The Bronx, New York. After six weeks there, the enlisted women were assigned directly to duty stations or to one of 17 other navy schools for specialized preparation for jobs including those of storekeepers, yeomen, radiomen, mail clerks, key punch operators, and cooks and bakers, etc. A large number of women were also prepared to serve in billets in naval aviation as parachute riggers, aerographer's mates, control tower operators, aviation machinist's mates and aviation free gunnery instructors. WAVES of the hospital corps were on duty or in training in the offices, laboratories and wards of naval hospitals throughout the U.S.

All officers received their introduction to navy life at the Naval Reserve Midshipmen's school at Northampton, Mass. After two months of indoctrination, they were commissioned and were either ordered immediately to duty stations or to other schools. Specialized officer training was given in such fields as aerological engineering, radio, ordnance, communications, supply, air navigation instruction and the Japanese language.

CLASS OF WAVES AND MARINES receiving instruction in control tower operation at Gordon field, Ga., in 1943

Each class of officer candidates after June 1943 included a number of qualified enlisted women who were recommended for officer training upon completion of six months of service in an enlisted status. Already women who were seamen upon first assuming their duties had qualified for third class petty officer ratings and petty officers had advanced within the classes of their own specialties.

By virtue of an act of congress approved Nov. 9, 1943, officers and enlisted personnel of the women's reserve became entitled to all allowances or benefits available to navy men, with the exception of those allowed to or for a spouse. The same legislation removed the limitations which had been previously placed on rank and provided for one captain in the women's reserve. In accordance with the latter provision of the bill, the director of the women's reserve, Mildred H. McAfee, was promoted to the rank of captain.

Applicants for the women's reserve in 1943 had to be citizens of the United States with a minimum of two years of high school education and able to meet physical requirements and make a satisfactory score in an aptitude test. Wives of commissioned officers in the rank of ensign or above in the navy and women with children under 18 years of age were not acceptable in 1943. At the time of enlistment, officer candidates had to be between the ages of 20 to 49 inclusive, and enlisted women between the ages of 20 to 35 inclusive. In addition, officer candidates had to hold a college degree or have had two years of college with at least two years of acceptable business or professional experience; also two years of mathematics in high school or college.

(M. H. McA.)

Women's Reserve of the United States Coast Guard Reserve: *see* COAST GUARD, U.S.

Wood, Sir Kingsley

(1881–1943), British statesman, son of a Wesleyan minister, was admitted as a solicitor in 1903, entered public life as a London county councillor for Woolwich in 1911 and sat in parliament as Conservative member for Woolwich West after 1918. Between 1919 and 1929 he was parliamentary private secretary to various minis-

ters of health; from Sept. to Nov. 1931 he was parliamentary secretary to the Board of Education in the national government. In Nov. 1931, he became postmaster-general and during his tenure effected many reforms which put the post office on a profit-making basis for the first time in many years. When Stanley Baldwin became prime minister in June 1935, Sir Kingsley was transferred to the ministry of health. He retained that office until 1938, when he succeeded Lord Swinton as minister for air. His policies and leadership in the air ministry were harshly attacked by both government and opposition leaders, and he was shifted to the post of chancellor of the exchequer in May 1940, where he was given the difficult task of financing Britain's war expenditures. A few hours before his death he was at work finishing details for an announcement to be made to parliament the following afternoon on a pay-as-you-go tax plan. Sir Kingsley, who had been knighted in 1918, died in London, Sept. 21.

Wool. The quantity of wool shorn in the United States in 1943 was estimated at 376,822,000 lb. This quantity was 15,500,000 lb. or about 4% smaller than the record production in 1942, but about 11,000,000 lb. or 3% above the ten-year (1932–41) average. The decrease in production from 1942 was a result of the smaller number of sheep shorn, as the average weight of wool per sheep shorn was practically the same in 1943 as in 1942. The estimated number of sheep shorn was 47,674,000 compared with 49,784,000 in 1942 and the ten-year average of 45,691,000. The average weight of wool per sheep was 7.90 lb.

The consumption of greasy shorn wool for the first nine months of 1943 amounted to 863,938,000 lb. Of the 445,000,000 lb. of scoured wool consumed during this period, the National Association of Wool Manufacturers reported that 37% was of domestic origin and 63% imported. Production of wool cloth for the first three-quarters of 1943 was 10% less than that manufactured during the corresponding period in 1942; the consumption of apparel wool during those months rose 7% above last year's totals for the same period.

The Australian 1942–43 wool clip represented the fourth seasonal output handled under the arrangement whereby the United Kingdom government acquired the whole of the Australian product, other than the requirements of local manufacturers, for the duration of the war and one full wool year thereafter. The greasy wool appraised by members of the National Council of Wool Selling Brokers of Australia amounted to 3,294,323 bales, totalling 1,047,060,000 lb. The Argentine 1942–43 wool production amounted to 517,000,000 lb., the largest on record.

To assure the effective distribution of wool for the fulfillment of war and civilian requirements in the United States, the War Food administration, on April 17, 1943, issued an order requiring that domestic grown wool which had not been sold prior to April 25 must, with certain exceptions, be sold to and purchased only by the Commodity Credit corporation. The order applied to both shorn and pulled domestic wool, the wool being purchased through handlers on the basis of ceiling prices, less handling costs. It then would be sold directly to manufacturers at ceiling prices. The wool was appraised by committees composed of three members appointed by and working under the director of food distribution. Appraisals were made on the basis of grade, shrinkage, length of staple and other factors affecting the value. Up to Dec. 11, 234,000,000 lb. of wool had been appraised.

In addition to the purchase of approximately 250,000,000 lb. of domestic grown wool, an additional amount of foreign grown wool was purchased by the government. This stockpile consisted of 290,000,000 lb. of Australian; 6,000,000 lb. of Argentinean; 32,000,000 lb. of Uruguayan, 20,000,000 lb. still remaining in Uruguay at the end of 1943. This total of 328,000,000 lb. of foreign wool did not include an estimated amount of 525,000,000 lb. of Australian, New Zealand and South African wools owned by Great Britain and stored in the United States which, if necessary, could have been used for domestic consumption. Sizable quantities of the British stockpile of wool were transshipped to England.

On Dec. 15, 1943, an announcement was made by the War Production board for proposals for orderly withdrawals from the government-owned stockpile of wool acquired through the Defense Supplies corporation. Reasons for considering such withdrawals were to the effect that the shipping situation had improved to such an extent that potential obstacles to continued importation of wool from the primary sources of supply had been largely overcome and that it was essential that storage space in the U.S. utilized for the wool stockpile be freed for use in storing urgently needed commodities of strategic importance. Also, it was pointed out that by making this stockpiled wool on a "spot" basis it was anticipated that part of the shipping space used for the importation of wool could be shifted to other products, as well as ease the strain on port and railway facilities. (*See* also SHEEP; TEXTILE INDUSTRY.) (C. M. AN.)

Woollcott, Alexander (1887–1943), U.S. author, critic and actor, was born Jan. 19 in Phalanx, N.J. After graduating from Hamilton college, New York, 1909, he joined the staff of the New York *Times* as a cub reporter. Five years later, he succeeded to the post of dramatic critic and subsequently he worked on nearly every newspaper in New York. In 1929, he branched out into the radio field as "Town Crier" of the air and established a nationwide reputation as raconteur, gossip, conversationalist, wit and man-about-town. As a literary critic, he wielded tremendous influence on the nation's book-buying public. Mr. Woollcott also played in the title role of *The Man Who Came to Dinner,* 1940, a play in which he himself was lampooned. He was the author of *Mrs. Fiske—Her Views on Acting* (1917), *Two Gentlemen and a Lady* (1928), *While Rome Burns* (1934) and publisher of two anthologies, *The Woollcott Reader* (1935) and *Woollcott's Second Reader* (1937). He was stricken with a heart attack while participating in a radio forum in New York city, Jan. 23, and died a few hours later.

Words and Meanings, New. English is the language of which it may least be said that it ever stands still. In wartime, with nearly all the English-speaking peoples engaged in the conflict, its growth is vastly accelerated. Most of the added terms, or new meanings of old terms, quickly fade as their usefulness dies out; others remain, but have little more than historic value; a few become active members of the community of words. The following were selected out of the many that were born, or gained popularity, from 1940 to 1943, because they seemed to offer the greatest promise of survival, or because they were most typical of the period.

The names of coiners, as far as they were ascertained, appear in italics. Dates, unless otherwise specified, are those of the initial appearance of the term or new meaning; a preceding hyphen (-1939) means that the term or meaning is at least as old as the date given.

activate. To bring into active existence, as "to activate an air corps squadron"; to put into practise, get busy on, as "to activate a reconversion program." (Orig. military, -1941.)

aeropolitics. Political and economic development as influencing, and as influenced by, the development and application of aviation. (*Burnet Hershey,* Feb. 28, 1943.)

bazooka. A firearm, consisting of a metal tube slightly over 50 inches long and under 3 inches in diameter, with a shoulder stock, front and rear grips, sights, electric battery to set off the charge, and trigger, designed to launch rocket projectiles. It is operated by two men, one holding and firing the gun, the other loading. (*Major Zeb Hastings,* 1942, after the musical instrument invented by Bob Burns, 1905.)

block-buster. The 4,000-lb. bomb dropped by British Lancaster planes beginning in March 1942; a similar heavy bomb. (1942.)

brief. To give formal instructions, regarding a scheduled military operation, to those about to engage in it. (-1940.)

brownout. A voluntary, partial dimout. (Australia, 1942; U.S., 1943.)

cargoliner. A transport plane carrying freight exclusively. (1943.)

chin turret. A gun turret mounted beneath the nose of bombers. (1943.)

co-belligerent, *adj.* Fighting together (with another power) without a formal alliance, as "co-belligerent Italy." *n.* A country so fighting. (-1813.)

commando. A unit of British soldiers trained in close-range fighting for raids on enemy territory; loosely, a member of such a unit, or of a similar unit of another nationality. (*Winston Churchill*, Oct. 10, 1941, from Portuguese or Spanish **comando** adopted as name for defense units of Boer Republic.) Compare **ranger.**

enrich. To supply with added food value, esp. with vitamins and minerals. A government standard (promulgated May 1941; July 3, 1943) exists for enriched flour. (*Frank L. Gunderson*, summer 1940, from *Quaker Oats Co.*, 1932.) **enrichment.**

expediter, expeditor. An official charged with keeping uninterrupted the flow of materials or of routine work in industry and government. Some expediters are agents of the U.S. army and navy; others are in direct employ within industries and government bureaus such as the War Production Board. (*General Electric Co., c.* 1925)

extend. To make a scarce or expensive food go farther by preparing in combination with a cheaper or more plentiful food, as "to extend meat with cereal." (-1934 as "to adulterate.") **extender.**

featherbedding. The limiting of work or output in order to spread jobs and thus prevent unemployment. **featherbed rules.** Union regulations to accomplish featherbedding.

feather merchant. A slacker. (After comic-strip characters of *Billy De Beck*, 1937, from earlier senses.)

GI, GI Joe, *n.* An American soldier. *GI* is to the army as a whole what *doughboy* is to the infantry. (Short for **GI soldier,** -1941.) *adj.* Pertaining to the army services, or ministering to its needs, as "GI food," "a GI dance." (General issue.)

glide-bomb. To bomb, from an aeroplane, by descending at an angle of less than 65° from the horizontal when releasing bombs. Steeper dives are called *dive-bombing.* (-1940.)

globaloney. Nonsense about matters affecting the world as a whole. (**Global baloney.** *Rep. Clare Luce*, Feb. 9, 1943.)

handie-talkie, *military.* A portable two-way radio telephone weighing about five lb. (-1942.) Compare **walkie-talkie.**

homeostasis. The tendency of living organisms to maintain a relatively stable condition by means of mechanisms which compensate for disturbing factors. (*Walter B. Cannon*, 1926.) A similar function elsewhere, as in the social organism. (-1941.)

incentive pay. Wages paid in accordance with various "incentive plans" or "systems" which reward increased production; in particular, a piece-work or modified piece-work system. (-1907.)

longram, *telegraphy.* A deferred day message with a minimum charge for 100 words. (**Long telegram.** Dec. 1942; service effective Feb. 1, 1943.)

mission. The objective of an operational flight, esp. where bombing is involved; the flight itself. (-1942.)

mock-up. A model of an aircraft, constructed of inexpensive material and usually full-size, for the purpose of prearranging or studying details of construction and use. (-1938.) A similar model of other items of military equipment. (-1942.) A model in general. (1943.)

newsmap. A map issued periodically with current events depicted on it, and with accompanying text and illustrations. (**News Map** *of the Week*, a copyrighted periodical. 1938.)

pathfinder. A flare capable of illuminating the ground for bombing purposes, even through fog, when dropped by attacking planes. Called also *TI* (target-indicator). (Nov. 1943.)

pattern-bomb. To bomb, from a number of aircraft, in such a way that the relative position of the craft determines the "pattern" of the bombs when they strike, so as to cover the target in a desired manner.

pesticide. An agent for controlling farm or garden pests of whatever sort. The Canadian Fertilizers and Pesticides administrator was commissioned Jan. 20, 1942. (*Grant S. Peart*, Sept. 18, 1940.)

pin-up girl. A girl with whose picture men, esp. soldiers, like to decorate their quarters. (-1941.)

probable. A supposed casualty, esp. referring to military craft, as "there were ten destroyed and five probables."

ranger. A member of a battalion of American soldiers, formed Dec. 1941, trained in close-range fighting for raids on enemy territory. (1942.) Compare **commando.**

restore. To bring back a food to the original nutritive value of its ingredients. (1939.)

scuttlebutt, *naval slang.* Gossip; a rumour. (-1938. **Scuttle-butt** story, -1901; scuttle butt, drinking fountain on board ship, -1843.)

Seabees (*gen. plural*). The U.S. navy construction battalions, comprising welders, carpenters, mechanics, and other personnel skilled in building and supplementary trades, trained to fight as well as work in the field. (1942.)

shuttle, *combining form.* Involving vehicles, esp. aircraft, making repeated trips between fixed points, as "shuttle bombing," "shuttle raid," "shuttle plane." *v.* To move a vehicle or by a vehicle in such trips. (-1941, from **shuttle** train, -1891.)

snafu, *military slang.* In a mess, haywire. (**Situation normal: all fouled up.**)

sortie. An operational flight by one military aircraft. Each return to base for replenishment is counted as the end of one sortie.

stretch, stretcher. *See* **extend.**

suntans. Summer uniform worn by American soldiers.

TI. *See* **pathfinder.**

trainasium. A conglomerate structure of metal bars, resembling a large bird-cage, used to develop muscular co-ordination in military students. (**Training gymnasium.** -1942.)

triphibian. Adapted to or using the three elements, land, water and air, as "a triphibian assault." (**Tri+amphibian.** *Winston Churchill*, Aug. 31, 1943.)

triphibious. *See* **triphibian.** (**Tri+amphibious.** *Leslie Hore-Belisha*, 1941.)

underground, *n.* An outlawed political or military movement or organization operating in secret; such organizations collectively, as "the European underground will strike against naziism"; underground fortifications, materials or equipment protected under ground against attack. *adv.* Into hiding, into the underground, as "the patriots had to go underground." **undergrounder.** A member of the underground.

upgrade. To raise (the name or number of a quality) without improving the quality itself, as "cheaper meats were illegally upgraded." (-1941.)

walkie-talkie, walkee-talkee, walky-talky, *military.* A two-way radio telephone small enough to be transported on horseback; a smaller set carried on the back of one man. (-1940.) Compare **handie-talkie.**

wolf. A determined would-be seducer, a man "on the make." (-1937, esp. 1942, from an older underworld sense.) (D. L. Br)

I.—INTRODUCTION

In 1943, the industrial and military might of the United States, the amazing power of the Red army and the destructive force of the R.A.F. began to pay dividends which surpassed all expectations and started the turning of the tide of World War II. American men and materials flowed to all theatres of war in great convoys and were instrumental in enabling Allied forces to take the offensive. The Red army not only engaged the bulk of the wehrmacht on the eastern front, but destroyed its offensive power as well. In turn, the R.A.F., taking vengeance for the battle of Britain, crippled the reich's war industry and played havoc with German civilian morale. In the Pacific, the burden of the war against the Japanese was carried by American naval, air and land forces and the attack on Truk in Feb. 1944 indicated that an assault on Japan proper was in the making. As the year 1943 ended, the axis powers, failing in their physical attempts to halt the growing military power of the Allies, turned on their propaganda machine in full force in a supreme effort to sow dissension among the United States, Great Britain and the soviet union.

Theirs was the desperate hope that the "Big Three" would become divided over political issues and slacken in their joint war effort. The Allies, however, were determined to push political controversy into a back seat until the axis was defeated. At conferences in Washington, Cairo and Tehran, they agreed on concerted action to destroy the military power of Germany and Japan.

II.—AIR WAR OVER EUROPE

1. Introduction.—In 1943 the Allied air offensive was producing terror and devastation in Germany. Blockbusters fell in mounting numbers on Hitler's Festung Europa, demolishing entire cities, razing war plants, destroying rail centres and breaching dams. Thousands of homeless civilians were evacuated from the stricken industrial areas. Civilian morale was seriously undermined and popular resentment against the nazi regime became so widespread that the gestapo was compelled to employ its customary brutal measures to silence the growing undercurrent of defeatism. Air power, first applied by the nazis to batter civilian populations into submission became, in 1943, a Frankenstein that turned against its inventors and threatened to destroy them.

From the strategical point of view the Allied air offensive was eminently successful. The destruction of war plants robbed the nazi armies in Russia and Italy of vital supplies. The luftwaffe, compelled to maintain larger forces at home to counter the Allied air blows, weakened its formations in Russia and Italy.

In early 1943 the royal air force was still the principal offensive weapon of the Allied air command and was used primarily as an area-bombing force. The huge formations of British bombers that

THE FOCKE-WULF plane plant at Marienburg, East Prussia, after bombing by U.S. Flying Fortresses Oct. 9, 1943. British Air Chief Marshal Sir Charles Portal called this raid "the most perfect example of the accurate distribution of bombs"

raided the reich at night would concentrate over a given industrial city and saturate it with several thousands of tons of bombs in the shortest possible time. The U.S. 8th air force, then only one-seventh the size of the R.A.F., had the task of making high-level precision attacks on specific nazi targets. The U.S. bombers sacrificed bomb-load capacity for heavier armour and greater fire-power needed to ward off the enemy fighter planes. The success of the precision attacks inclined Allied leaders to the view that a joint air offensive to destroy the economic fabric of the reich was entirely feasible and they gave approval to a round-the-clock aerial offensive over the reich.

This new offensive was well under way in 1943. By the spring, the combined Allied air force based in England was raining an ever-increasing tonnage of explosives over reich industrial and military objectives. Flights of 700 or more planes sweeping across the channel were nearly a daily—or nightly—occurrence. The bomb-loads increased substantially and the area of damage was widened. Britain itself was producing more planes than the reich and in the 20-month period from Jan. 1942 to Sept. 1943, the U.S. alone produced 110,000 aircraft. Furthermore, under its building program for 1944, American factories were scheduled to turn out more than 150,000 planes, the greater part of which were destined for the European theatre of operations. By the end of the year, it appeared that the once-mighty luftwaffe was hopelessly outnumbered and was facing extinction, since one of the major objectives of the Allied strategy was destruction of the German air force.

2. The Ruhr Valley Raids.—One of the chief targets of the Allied bomber squadrons was the Ruhr valley, industrial arsenal of the reich, which was hit with terrific force. In the month of June alone, the R.A.F. dropped 15,000 tons of bombs on Germany, mostly over the Ruhr. Of the Ruhr cities having populations of 100,000 or more, all but one had been bombed at least once, some scores of times, by the summer of 1943. More than 1,000 acres of Duesseldorf were devastated in a single raid on June 11, 1943. The giant Krupp munitions works in Essen were paralyzed by repeated Allied aerial blows and in the city proper, more than 4,000 acres had been laid waste. Cologne, the first city to feel the destructive weight of the 1,000-plane raid, had been blasted more than 120 times by the end of the year. Half of the city of Wuppertal had been levelled to the ground, Dortmund was in ruins and the commercial centre of Duisburg was demolished. Bombs also rained with monotonous regularity on Stuttgart, Muelheim, Krefeld, Bochum and Oberhausen.

In order to kill "20 birds with one stone," R.A.F. planes flew deep into the reich, May 16, and dropped dynamite-charged mines on the Moehne and Eder dams, two of the biggest in Germany. The great river walls were breached by the explosives and millions of tons of water spilled into the upper Ruhr and Weser valleys. The cities of Dortmund, Wuppertal, Soest, Kassel and Gelsenkirchen were inundated. Swedish travellers reported that nearly all war work in the Ruhr had been brought to a standstill by the floods and that the raid on the dams was 20 times more destructive than an ordinary air attack.

3. Long-Distance Raids.—The Allied raids were not confined exclusively to the Ruhr. Industrial and military establishments throughout axis Europe were battered by Allied planes. Long-distance bombers struck at objectives as far distant as Trondhjem in Norway and Crete in the Mediterranean. Industrial cities in Italy were heavily bombed by formations based in England and North Africa while Russian air fleets from bases to the east struck furiously at East Prussian targets. One of the spectacular raids of the European air war was a bold attack staged by a formation of 177 U.S. Liberator bombers, based in North Africa, against the oil refineries at Ploesti, Rumania. The Ploesti raid on Aug. 1, 1943, one of the longest round-trip flights of the year, was costly. Fifty-three of the bombers were lost and 400 men were casualties. But the results were satisfactory. Although the bombers spent only 60 seconds over the target, they crippled five of the refineries. One source estimated that it would take the Germans at least several months to repair the damage.

4. The Destruction of Hamburg.—The great summer air offensive was climaxed by the raids on Hamburg which started July 24. The greatest port and second city of the reich, Hamburg was bombed eight times in six days by R.A.F. and American formations. At least 8,000 tons of explosives and incendiaries struck the city in those 144 hours. Flames from the burning buildings shot thousands of feet into the air lighting up the heavens above Hamburg like a blazing canopy. The once-flourishing city of 1,692,000 lit up like tinder under the impact of the Allied bombs. Fires swept through street after street. Some quarters of the city were entirely wiped out; hardly a district escaped punishment. The cascading explosives smashed docks, cranes, harbour installations and submarine pens. Oil refineries, factories, gas works and telephone exchanges were also destroyed. Casualties were estimated at 14,000 killed and more than 400,000 people were reported left homeless. The nazi raids on Coventry —England's most heavily-bombed city—were trivial compared with the Allied blows on Hamburg. In their heaviest raid on Coventry 400 German planes dropped 450 tons in nine hours—a rate of almost a ton a minute. In the eighth and biggest raid on Hamburg, the R.A.F. dropped 2,250 long tons in 45 minutes—a rate of more than 50 tons a minute. A close examination of reconnaissance photographs subsequently revealed that about 77% of the city was destroyed. About 5,000 to 6,000 acres were totally devastated. The raids on Hamburg were a convincing demonstration of faultless co-operation between the day and night arms of the combined Allied air force. While the R.A.F. sledge-hammered

the city by night, saturating wide areas, the U.S.A.A.F. followed up with pinpoint attacks on vital targets left unscathed by the British bombers. Speedy plywood Mosquito bombers filled the intervals with "psychological" attacks intended to wear down civilian morale and to keep the defenders off balance.

5. The Battle of Berlin.—The methodical destruction of Hamburg was a portent of things to come. It signified that the combined Allied air forces intended to obliterate Berlin by overwhelming mass aerial bombings. An Allied announcement to this effect led the nazi authorities to evacuate all residents, except workers in essential war industries and civilian activities, from Berlin. The capital of the reich and the greatest manufacturing centre on the continent, Berlin had been raided over 60 times up to the late summer of 1943. In August the R.A.F. struck Berlin twice, Aug. 23 and Aug. 31. In each raid 1,500 tons of bombs were dropped on the city. Although this figure was about twice the tonnage loosed over Berlin in any previous raid, these blows were merely skirmishes in which the R.A.F. was testing its own sinews and the strength of enemy defenses. In the first raid the British lost 58 bombers, the heaviest R.A.F. loss in a single raid in 1943. In the second, the nazis gave evidence that they were fully determined to protect the capital. The luftwaffe had sent up 500 night fighters to meet the onrushing R.A.F. raiders. The German interceptor craft, many of which were fitted with searchlights in their noses, dropped white flares in geometrical patterns so that the British had to cross the lighted lanes, revealing themselves for attack. Although the British planes broke through the luftwaffe air defense, their losses were again high, and 47 bombers were missing. On Sept. 3, the British air command shifted its tactics to meet the strong nazi air defense. Instead of using the slower Halifaxes and Stirlings, they employed the speedier Lancaster bombers, which flashed across Berlin in 20 minutes, dropping their entire bomb load of 1,120 tons in that interval, and then streaked back to their home bases. Casualties in this raid were halved and only 22 bombers were lost over Berlin as well as in operations over the Rhineland and France and channel patrols.

The capital was then spared heavy raids until Nov. 18, when the battle of Berlin began in earnest. On that day, a great R.A.F. armada bombed both Berlin and Ludwigshafen-Mannheim with over 2,500 tons of bombs. Four days later the R.A.F. formations opened a new bombing cycle. Starting Nov. 22 the R.A.F. pounded the capital on five consecutive nights, loosing some 5,000 tons of explosives in all over the city. Two of the attacks were staged by R.A.F. Mosquitoes; the other three were full-dress raids. The R.A.F. mixed incendiary with explosive bombs to cause the greatest damage possible. Blockbusters were used to collapse walls, pierce water mains, snap electric power cables and break windows thus creating a draft to fan the flames. Then thousands of incendiaries were poured over the city. Once fires were started, more explosives were tumbled over Berlin to create enough blast and vacuum to spread the fire over unburned areas. A large section of the city lay in ruins. The centre of town was the worst hit. Three rail stations were reported destroyed. The foreign office on Wilhelmstrasse was burned to the ground and the German air ministry, as well as the British, French and U.S. embassies were demolished. The industrial areas suffered heavily, many Berliners were bombed out and thousands of homeless left the city.

In the 77-day period, starting Dec. 1, 1943, and ending Feb. 15, 1944, the R.A.F. cascaded more than 13,000 tons of bombs over the capital in 11 raids. This brought the total weight of explosives dropped from the beginning of the battle of Berlin, Nov. 18, 1943, to more than 28,000 tons. The R.A.F. bombing of Feb. 15, 1944, was one of the heaviest aerial attacks in history. On that date, an estimated 1,000 British bombers smothered Berlin with more than 2,800 tons of bombs in a fiery 30-minute attack. Returning fliers said the capital was a solid wall of flames and that smoke columns plumed four miles into the air. By March 1, 1944, it was reported that Berlin was a dying city. Almost every utility from the Templehof aerodrome to the transit service was destroyed or severely damaged. Reich government offices were moved out and reports from neutral countries said that more than 50% of the city's dwellings had been demolished.

6. The Luftwaffe on the Defensive.—By the winter of 1943–44, the luftwaffe was waging a desperate but losing battle for survival. Hitler, compelled to withdraw many planes from Russia to protect the home front, frantically switched his bomber plants to production of fighter planes. But these last-minute measures were unavailing. The German fighter command suffered heavy losses and was unable to check the Allied air fleets, which in the month of July alone, dropped 26,000 tons of explosives on targets in Germany. As the luftwaffe was both quantitatively and qualitatively inferior to Allied air forces, it had no choice but to fight a defensive delaying action. Nevertheless, it was still an efficient and dangerous instrument for destruction and carried a deadly sting. German fighter squadrons generally took a substantial toll of attacking bombers and allied losses of 20 to 40 bombers on daylight raids were not uncommon. Accurate anti-aircraft fire was also responsible for bringing down many Allied warplanes.

Called on to develop defensive measures to counterbalance the topheavy Allied air superiority, the Germans speeded up fighter craft production in late 1943. At the same time, however, the number of German aircraft shot down by Allied formations also increased. In Oct. 1943 U.S. bombers alone destroyed a total of 784 planes during seven operational days that month, while all German planes shot down by the combined Allied air forces based in England during October numbered 1,079. Nazi aircraft losses in the Mediterranean and Russian theatres of war are not included in this figure. Although German aircraft plants substantially augmented the output of combat planes, it was doubtful whether they could produce enough planes to balance these losses.

Among the other defensive measures introduced by the Germans to overcome their deficiency in numbers was a radio-controlled rocket-propelled glider bomb. First reported in action in the Italian campaign by Allied officers, the new rocket bomb was towed by mother craft at high altitudes and then released toward the target. Steered by remote control radio, this spectacular missile was reported very deadly in effect.

7. The Growth of U.S. Air Forces.—The phenomenal growth of the U.S. bomber squadrons based in England was one of the amazing and brilliant accomplishments of the U.S. war effort in 1943. When the Allied military command decided to try out the efficacy of the yet untested precision daylight raid over French targets in the summer of 1942, the U.S. 8th air force had 12 Flying Fortresses available for the experiment. On Aug. 17 of that year these dozen bombers flew 50 mi. into France, dropped 18 tons of bombs on Rouen's freight yards, and returned without the loss of a single plane. The crucial experiment was a success and a good section of the American aircraft industry was geared to the production of thousands of bombers to increase the size of the U.S. 8th air force and make it a mighty offensive weapon. Exactly a year later, on Aug. 17, 1943, a U.S. aerial task force, this time totalling more than 350 Fortresses, penetrated deep into Germany, and divided into three sections. Two of the flying columns dropped 424 tons of bombs on Schweinfurt, damaging an important roller-bearing works, and battled their way back to Britain through dense flak and clouds of nazi interceptor planes. The third column continued on to Regensburg, paralyzed the big Messerschmitt factory with a bomb load of 298 tons,

and shuttled straight across to North Africa. More than 800 American heavy bombers were in the aerial armada that struck Frankfurt-on-Main on Jan. 29, 1944, with 1,800 tons of explosives —the heaviest raid to that date carried out by the U.S. 8th air force. With the Frankfurt raid, the U.S. air forces in England had come of age and had reached parity with the royal air force.

During its first full year of operation, the U.S. 8th air force had carried out 124 attacks. Its targets were U-boat operating bases, building and repair yards. It also attacked luftwaffe airfields, installations and nazi plane factories as well as industrial plants and transport and shipping facilities. The weight and variety of the U.S. heavy bomber attacks grew steadily and the luftwaffe was compelled to double, in western Europe, the number of fighter craft whose specific job was to ward off the big daylight raiders.

The luftwaffe, nevertheless, did succeed in inflicting heavy losses on some formations. In the Regensburg-Schweinfurt raid, 60 Fortresses were lost with 581 crew members, of whom 346 were alive although prisoners in Germany. During the triple raid on Brunswick, Oschersleben and Halberstadt on Jan. 11, 1944, 60 bombers of the U.S. 8th air force, manned by an estimated 595 men, were shot down. The U.S. air command contended that the loss of the bombers in both raids was more than compensated by the destruction of vital German industrial plants.

By the winter of 1943–44, the U.S. 8th air force, employed solely on strategical missions, was joined by the U.S. 9th air force. A tactical air weapon, the 9th consisted mostly of medium bombers and fighters designed to soften coastal defenses for the scheduled invasion of western Europe.

8. Statistics.—The following figures graphically illustrate the scope and intensity of the Allied air bombardment of the reich during the last three months of 1943:

	Short tons
Tonnage of bombs dropped:	
By the R.A.F.	44,240
By the U.S.A.A.F.	28,227
Total	72,467
Number of Operations:	
Night Bombing (R.A.F.)	56
Day Bombing (R.A.F.)	41
Day Bombing (U.S.A.A.F.)	36
Total	133
Plane Losses:	
R.A.F.	672
U.S.A.A.F.	489
Total	1,161

The following table shows the tonnage of bombs dropped annually on Germany by the R.A.F. since July 1940. The first figure is for the last six months of 1940 only:

	Short tons		Short tons
1940	5,880	1942	41,440
1941	25,760	1943	152,448

RUSSIAN TROOPS IN KHARKOV after its first capture by Red army troops Feb. 16, 1943. The city was retaken by the Germans a month later, but occupied again by the Russians Aug. 23

III.—THE RUSSIAN FRONT

1. Introduction.—In 1943 the myth of invincibility that once cloaked the German wehrmacht had been ground into the dust of the Russian steppes, and with it was laid to rest Adolf Hitler's grandiose schemes for converting vast sections of the soviet union into nazi lebensraum. Like the armies of Napoleon 130 years before, the nazi forces were retreating from Russia. Allowed no rest by the constantly attacking Russians, they were battered and bled white and were falling back toward the Baltic states, Poland and Rumania. But unlike the ragged French troops that broke and ran in headlong flight during Napoleon's retreat from Moscow in 1812, the Germans retreated in order and literally had to be uprooted by the advancing Russians. Discipline was still strong among the nazi troops and their morale was firm. Yet, barring a miracle, it was evident at the beginning of 1944 that the defeat of the wehrmacht in Russia was inevitable and only a matter of time.

Many military observers contended that Hitler's gross underestimation of the strength of the Red army was the greatest single factor contributing to the downfall of nazi armies in Russia. Others argued that Hitler and the German general staff were well aware of Russia's growing military power and that the nazi invasion of June 1941 represented a desperate gamble to destroy it. Time will be required to settle this academic controversy, but the successes of the Red army, the military talents of its leaders and its apparently inexhaustible reservoirs of manpower and matériel were established contemporary facts in 1943. While no little credit for the Russian successes in 1943 was due the Allies who shipped substantial quantities of planes, tanks, guns and motorized equipment to the soviet union, the Russian victories were, for the greatest part, self-earned. They accepted hardships and sacrifices cheerfully and showed astonishing fighting spirit. In 1944 the Red army was the most powerful fighting force in Europe and it was amply stocked with matériel turned out by the transplanted factories in the Urals.

2. The Winter Campaign, 1942–43.—The turn of the tide in the Russian campaign occurred at Stalingrad. There the Germans lost the strategical initiative, never to regain it throughout 1943. They had bludgeoned their way into the city in the autumn of 1942, and after terrific fighting they captured most of it. But they failed to dislodge the Russians from the bunker-fortified Mamai Kurgan hill, a high bluff that rises up from the Volga. This strategic hill controlled the west bank of the Volga and the Russians clung to it tenaciously, compelling the nazis to consume manpower and matériel in their futile efforts to capture the bluff. While the Germans were absorbed in their gigantic effort to oust the Russians from Mamai Kurgan, six soviet armies held in reserve launched a lightning manoeuvre to encircle the attacking force. Overnight, the positions of the opposing forces had changed; the trappers became the trapped. The nazis, apparently, did not realize the peril of their situation and made no effort to withdraw. By Dec. 1, the German 6th army, commanded by Marshal von Paulus, was encircled and completely cut off from other nazi units to the west. In order to prevent the wehrmacht from massing enough strength to break through the ring forged around Stalingrad and rescue the 6th army, the Russians launched another offensive 400 mi. to the northwest against the strong nazi belt of fortifications in the Kursk-Kharkov area. While this drive was proceeding, the Russian forces surrounding Stalingrad slowly twisted the garrote about the German 6th army, whose full strength was estimated at 22 divisions, or about 330,000 men. By Jan. 1, 1943, the 6th army's position was hopeless. Wishing

to avoid needless slaughter, the Russians urged von Paulus to surrender. But he refused and the soviet armies continued the grim task of systematic annihilation. On Jan. 26 a Russian breakthrough split the German defending army into two groups. One group, with the 6th army's commander, von Paulus, surrendered on Feb. 1. The second gave up the following morning. Thus ended the battle of Stalingrad, one of the bloodiest in history. Some sources believed that von Paulus could have broken out of the Stalingrad trap during the first week of the Russian offensive. High German officers captured in the ruined city declared that they never received the order to do so from von Paulus. The German commander himself was silent on this question. There were reports, however, that Hitler for some "intuitive" reason ordered von Paulus to stay and battle on.

The final victory at Stalingrad proved the wisdom of the Russian course, followed in the early stages of the Don battle, to avoid direct contact with the superior nazi plane-tank combat team. The Russians adroitly manoeuvred away from frontal assaults and carefully husbanded men and material for future battles. Other salient features of the Stalingrad battle were the courage and doggedness of Russian troops, the proper timing of the Russian counteroffensive that caught the Germans off guard and the superiority of Russian artillery which blunted the sharp point of the German panzers. One Russian general said that the Germans at Stalingrad committed no tactical mistakes, but added that they made a "strategical mistake" in putting Hitler at the command of the wehrmacht.

Important though Stalingrad was, it represented merely one phase of the Russian winter offensive of 1942–43. The major Russian objectives were to reconquer lost territory, to break the main German line by destroying its anchor positions and to destroy the wehrmacht. In order to accomplish its aims, the Russians launched five offensives: (1) the drive on Stalingrad, Nov. 19, 1942; (2) the attack on the German pocket in the Rzhev-Vyazma sector, opened Nov. 28–29, 1942; (3) the smash against the Kharkov-Kursk line, started on Dec. 15, 1942; (4) the Caucasus offensive opened Jan. 4, 1943, and (5) the drive to lift the siege of Leningrad, launched Jan. 11, 1943.

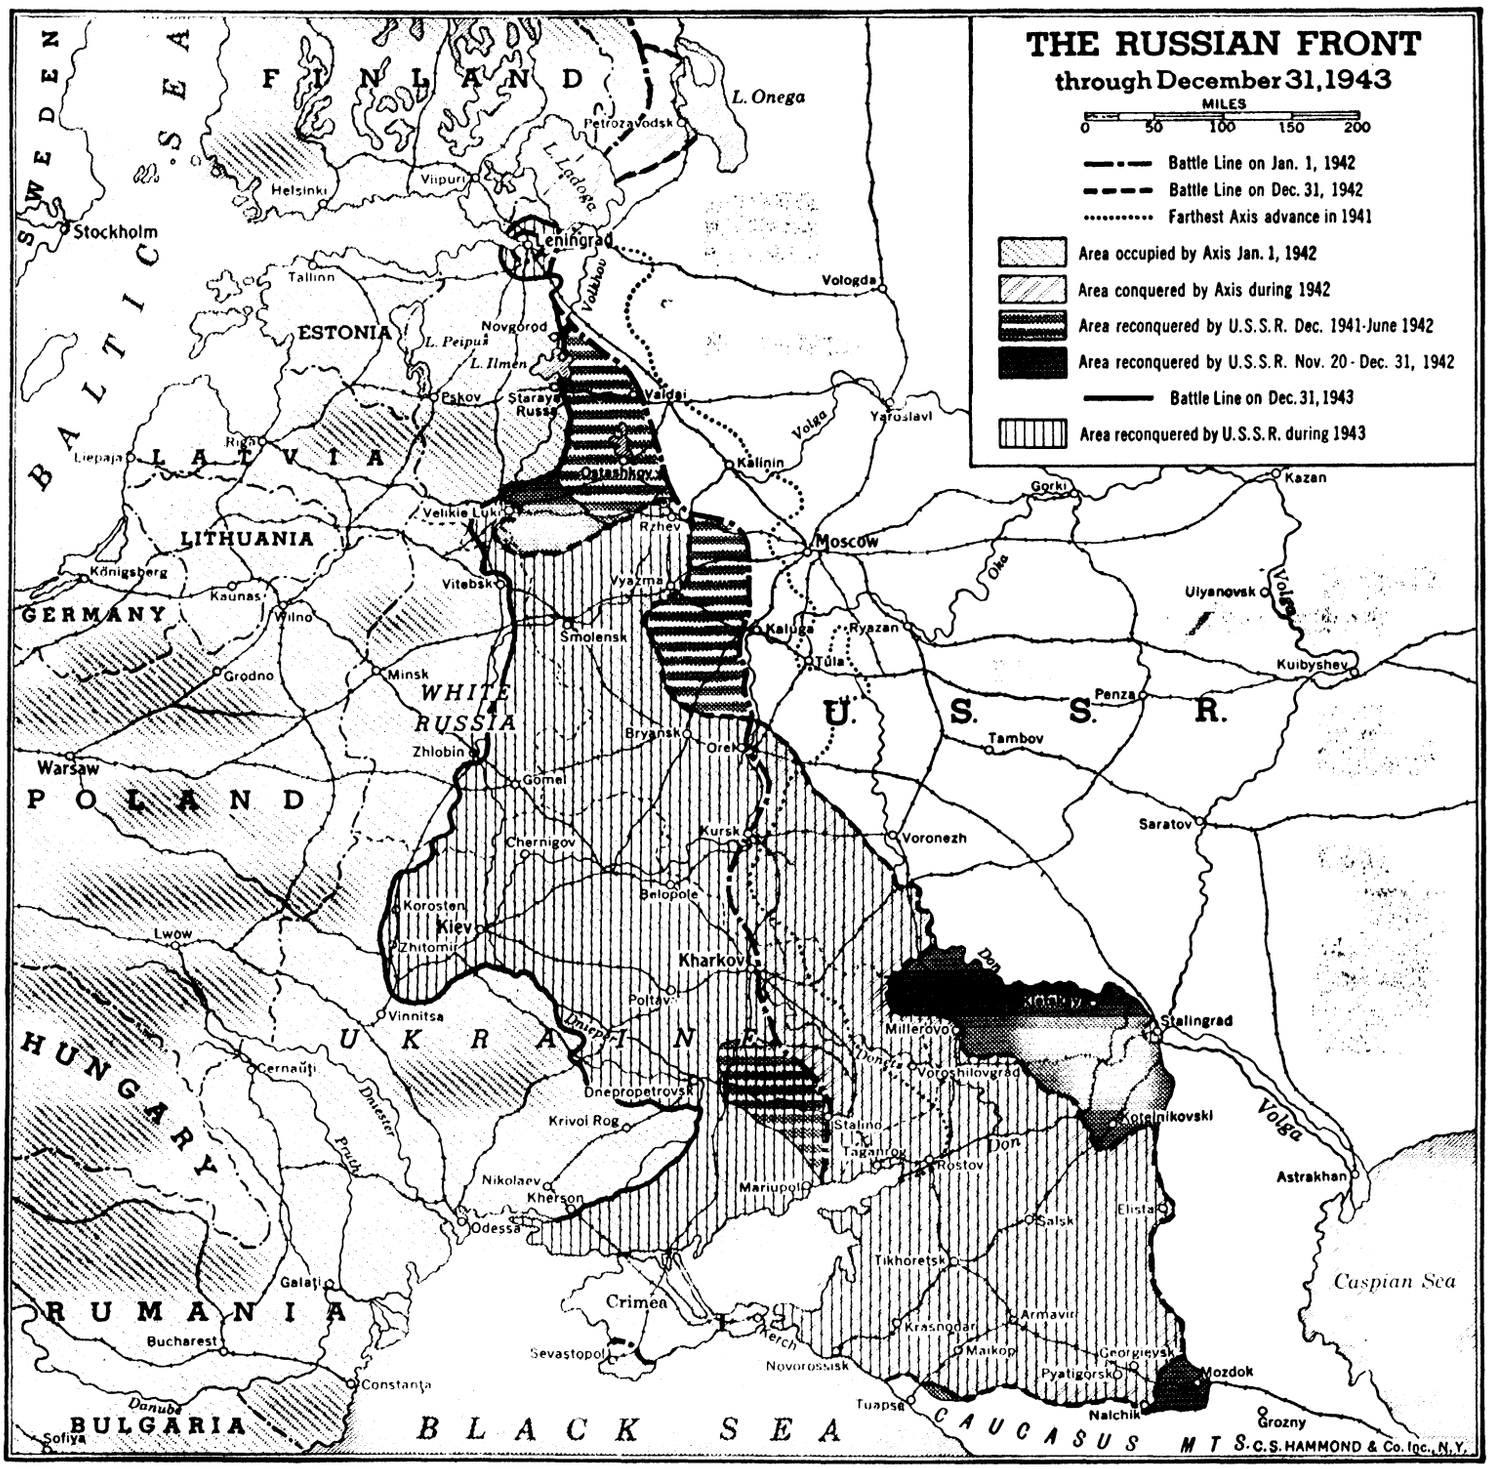
All five offensives were successful. The Germans, their tank forces chopped to pieces by Russian "blitz-grinding" tactics, fell back on all fronts to shorten their lines and tighten their defenses. On the northern front, three Russian columns struck hard at German fortifications controlling Leningrad, forced a breakthrough and carved out a broad corridor 9 mi. wide and 6 mi. deep. This corridor enabled the Russians to establish a land route by which to supply Leningrad with food and substantially eased the German siege.

Below Leningrad three Russian spearheads cut the Rzhev-Smolensk railway, annihilated an estimated 75,000 Germans in Velikie Luki, and captured the town by Jan. 2, 1943. The fall of Velikie Luki weakened the German hold on the Rzhev-Vyazma pocket and the Russians, maintaining systematic pressure on this key area, captured Rzhev, March 3, and Vyazma, a strong nazi "hedgehog" fortification, March 12.

Below Moscow, on the broad sector running from Orel through Kursk and Belgorod and south to Kharkov, initial Russian operations were successful. The defenses of the great German base at Kursk collapsed under a savage artillery bombardment and Kursk was captured, Feb. 8. The following day Belgorod was taken by the Russians, and on Feb. 16, Kharkov was reoccupied.

To the south, soviet units recaptured Rostov, the fourth time this city had changed hands since the start of the war.

In the Kharkov-Belgorod area, however, the Russians had outraced their lines of supply and the Germans struck back with surprising speed in March. The soviet armies in this sector retreated 80 mi. to protect their overextended communications and evacuated Kharkov by March 14, and Belgorod a week later.



Far south in the Caucasus another Red army offensive was meeting with success. Russian divisions were attacking with vigour the flanks of the thin nazi spearheads wedged into the Caucasus. The Germans fell far short of their original objective —the capture of the Baku oilfields—and were stalled 400 mi. short of their goal when the soviets opened their counteroffensive Jan. 4, 1943. The Russian plan was to isolate enemy forces in the Caucasus by cutting off their land escapes at Rostov and their waterway link with the Kerch peninsula. But rather than risk another Stalingrad entrapment, the Germans quickly folded back their lines and withdrew to the north. Five weeks after the start of their drive the Russians had retaken Mozdok, Georgievsk, Mineralne Vodi and other key cities in the Caucasus and had rewon most of the German footholds on the eastern shores of the sea of Azov. The nazis, however, still retained a bridgehead on the Kuban delta. Presumably they hoped to resume the Caucasus drive in the summer.

By April 1943 the five Russian drives had halted. The armies of both sides were obviously fatigued and required rest and replacements by fresh divisions. Spring thaws made the Russian roads impassable and both the Red army and the wehrmacht used this period of enforced inactivity to prepare for the summer campaigns.

During their second winter offensive, which lasted from mid-Nov. 1942 until the end of March 1943, the Russians had dealt a paralyzing blow to the nazi military machine. German casualties were huge. A Moscow statement said 850,000 nazis were killed and 350,000 more were taken prisoner during the four-month campaign. In addition to leaving thousands of dead on the battlefields of Russia, the nazis also abandoned an enormous quantity of war material and relinquished their grip on 185,000 sq.mi. of soviet territory. Of equal importance to the losses in men and material inflicted on the wehrmacht were the strategical gains of the Red army. The powerful German hedgehog line had been pierced at several points and the Russians were in a favourable position to launch flanking operations against the remaining German anchors.

3. The Summer Campaign, 1943.—Between April and July 5, 1943, land operations were restricted to local forays and exploratory sorties. Seasonal rains had softened the broad battle areas stretching from Leningrad to Novorossiisk into fields of oozing mud. In May, when the spring sun hardened airfields, the luftwaffe went out on strategical missions to disrupt and dislocate Russian communications deep in the rear. But the German bomber formations were met in mid-air by swarms of Russian fighter planes and scores of the nazi craft were destroyed before they ever reached their targets. At the same time Russian bombers proceeded on similar missions back of the German lines and had more success in carrying out their missions. This surprising reversal in the balance of air power on the eastern front was a bad omen for nazi plans for a new summer offensive. The luftwaffe had undergone a serious decline in power while inversely, the Russian air force had grown in strength until it was more than a match for its opposite number. The gradual weakening of German air power in Russia was due to: (1) the steady bombing of reich aircraft factories by Allied planes based in England, and (2) the diversion of German air-power to the Mediterranean and the European war theatres. At the same time the Red air force was strengthened by Allied aid—the U.S. alone had shipped 6,500 planes to the soviet union by the fall of 1943 —and the enormously increased output of Russian factories.

By the end of June both armies were preparing for a new test of strength. The Germans had an estimated 240 to 260 divisions

in Russia but the failure of the luftwaffe to gain ascendency over the Red air force crippled the efficacy of the strongest German offensive weapon—the plane-tank team. Although the wehrmacht was still a force to be reckoned with, it had suffered serious reverses over the winter and the morale of the individual soldier had been damaged. On the other hand, the Russian army was strong and ready, numbered between 250 and 275 divisions. Red army reserves were apparently limitless.

The third German bid to knock out the Red army was launched July 5, 1943. The wehrmacht attacked on the Orel-Belgorod front in areas where both armies had been concentrating troops for weeks. Hitler's commanders, hurling large forces of armour at the Russians, succeeded in denting soviet lines in the first week of battle. The wehrmacht command again used tanks to spearhead its drive with infantry following up. But the Russians, instead of leaving their positions, let the panzers pass through. Soviet infantry then emerged from its trenches, repulsed the German foot-soldiers with heavy losses while batteries of rapid-fire guns chopped up the tanks in the rear. The German drive was stopped after a week of fighting. Employing their enormously superior fire-power, the Russians then mounted a powerful offensive of their own which was preceded by one of the heaviest artillery barrages in history. The bombardment opened before dawn on July 12 and was concentrated on a sector near Orel about 20 mi. long and 4 mi. deep. The Russians massed great numbers of guns—more than 10 times as many gun barrels per mile of front as had been used at Verdun during World War I—and literally burned out the stricken German sector. Then big Russian tanks protected by planes plunged over the charred ground. Lacking the firepower to halt the Russian tank assault, the nazis fell back. They could not stem the irresistible soviet surge over the flat country toward Orel and on Aug. 5 both Orel and Belgorod were

captured by the Red army.

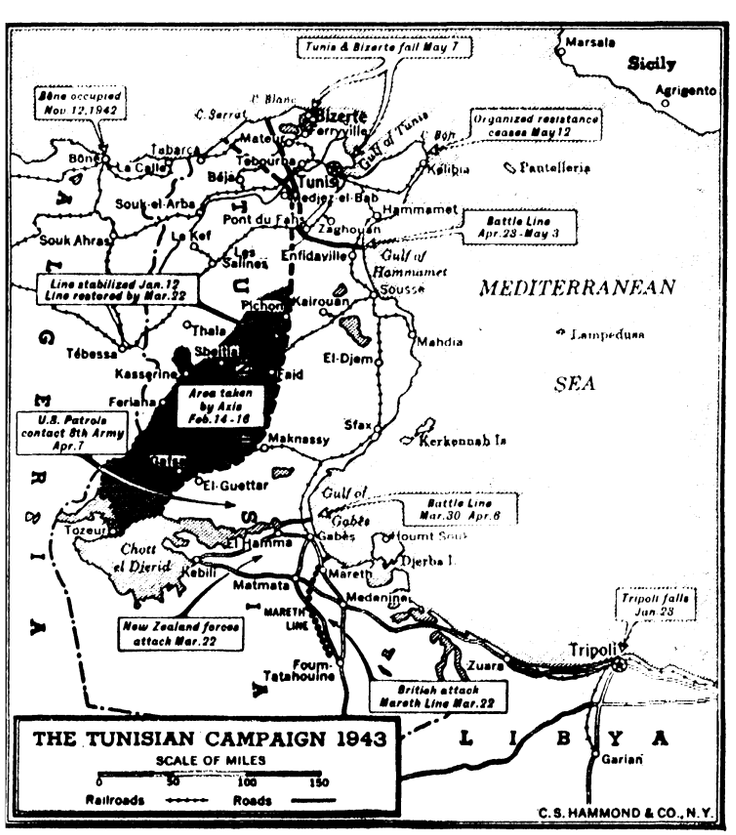
The fall of Orel endangered the entire German line below Smolensk. The soviet force then split into three columns. One sped toward Bryansk, another moved on Smolensk and a third oward Kharkov. All three columns pressed forward rapidly. The Germans retreated, albeit slowly and stubbornly. On Aug. 23, 1943, the Russians recaptured Kharkov, loosening another bolt in the collapsing nazi "hedgehogs" and hammered new spearheads into nazi defenses west of the city. This manoeuvre was designed to wrest the entire Donets basin from German control.

Having won three decisive battles—at the Kursk salient and at Orel and Kharkov—the Red army moved quickly westward in the hope of cracking the German defenses along the Dnieper river before the winter frosts set in. The key points of the German "Dnieper line" were, running north to south, Smolensk, Kiev and Dnepropetrovsk. But two nazi strongpoints stood in the path of the Russian push toward the Dnieper. To the north was Bryansk, a rail centre guarding the approaches to Smolensk and Kiev. To the south was Taganrog, a defense outpost wedged deep into Russian lines below Rostov. The Red army launched savage attacks on both of these key bastions. Taganrog was the first to fall. The Russians broke into the city Aug. 30 and wiped out the German garrison of 40,000 men in the Taganrog area in subsequent operations. A fortnight later, Sept. 17, the Russians took Bryansk. The soviet troops then stepped up their drive to the Dnieper. At the same time they launched a blistering attack on the German bridgehead on the Kuban delta, recapturing the naval base of Novorossiysk on Sept. 16. By this time the Red army offensive along the 700-mi. front from Smolensk to the axis bridgehead in the Caucasus gathered momentum. Shaken by the terrific force of the Russian blows, the Germans retreated steadily, giving up one vantage point after another. By Sept. 25 the nazis were compelled to evacuate Smolensk and retired to the west bank of the Dnieper. At the same time Russian forces were storming their way into the suburbs of Kiev and to the south were advancing on the Dnieper bend.

By Oct. 5 the Russians had made impressive gains due to their successful exploitation of German weak spots. Russian attacks would ripple up and down the German line until a lesion was found; then the attackers would hit that spot with a terrific hammer-blow. Lacking adequate reserves the wehrmacht could not cope with these tactics. The main nazi problem was to conserve manpower and to keep their armies intact. Although they had been badly mauled during the retreat to the Dnieper, the Germans had nevertheless conducted an orderly and skilful retirement. One factor was of negative help to the Germans. In retreating westward, they relinquished territory and shortened their lines. This shrinkage enabled them to release some forces used for policing occupied areas to fill gaps in the depleted ranks of the combat troops. During the first three months of their summer offensive, the Russians had reoccupied another 90,000 sq.mi. of territory. They recovered the Donets basin and its coal reserves, large sections of the fertile Ukraine and had put the oil of the Caucasus far beyond the German grasp.

4. The Winter Campaign, 1943–44.—The Russian winter offensive of 1943–44 was a continuation of the summer drive. The wehrmacht, weakened by heavy casualties, did not have sufficient strength to halt the soviet advances and to dig in behind a winter line. By contrast, the Red army was stronger than ever, had an abundance of arms and reserves and was able to continue its drive without stopping. On Oct. 5, the Russian line extended from Leningrad to Velikie Luki, then south to Gomel, whence it followed the configuration of the Dnieper to Zaporozhe. From Zaporozhe the line swung straight south to the German-held base at Melitopol and thence to the sea of Azov. At this time, the Red army had five major offensives operating: (1) in the Nevel area above Smolensk, the Russians were striking toward the Baltic states, (2) in the Smolensk area, soviet troops were edging their way along the route toward Minsk in White Russia, (3) in the Kiev area, the Russians were preparing to cross the Dnieper, capture the key base of Kiev and traverse the gateway to Poland, (4) in the Ukraine, Red army units were battering at the German defenses on the west bank of the Dnieper, aiming at Dnepropetrovsk and (5) on the northern banks of the sea of Azov, soviet armies were pounding at German lines defending Zaporozhe and Melitopol.

In Oct. 1943 the Russians crossed the Dnieper at several places, thus hurdling a major obstacle in their campaign to drive the nazis out of soviet lands. In the southern Ukraine, they sealed off the last land escape for German forces in the Crimea by taking Perekop, and to the north they crowned their offensive triumphs with the capture of Kiev, Nov. 6. The reconquest of Kiev collapsed the German middle Dnieper defenses and put the Russians at the gate of an invasion route into central Europe via a land corridor between the Pripet marshes on the north and the Carpathian mountains on the south. Exploiting the advantage gained at Kiev, the Russian armies fanned out to the west and captured Zhitomir, Nov. 13. At this juncture, the Germans lashed back with a strong counterattack, chopping away at the overextended Russian communications and compelled Gen. Vatutin's 1st Ukrainian army to relinquish Zhitomir and fall back toward Kiev. The nazis pressed their attack and on Nov. 30, they recaptured nearby Korosten. In order to ease their direct frontal pressure at the western gates of Kiev, the Russians countered with fierce blows around the periphery of the Kiev bulge, capturing several strongholds in this area. This manoeuvre compelled the nazis to halt their drive at Kiev and shift troops to the threatened areas to stave off potential Russian break-throughs. Gen. Vatutin's forces in the Kiev sector, reinforced with great masses of artillery, then loosed a terrific bombardment of the German positions. Nazi tank phalanxes that attempted to force Russian lines in the Kiev area were tossed in the air by the scorching barrage and by Dec. 27 Vatutin's forces had resumed the offensive. They recaptured Zhitomir, Dec. 31, and by Feb. 10, 1944, they had penetrated prewar Poland. Meanwhile, to the north, a similar concentrated artillery barrage had crushed the German fortifications around Leningrad. Three Russian armies then opened a concerted offensive in Jan. 1944. The northern column completely cleared the Leningrad area and had crossed into Estonia. The central column swept around Lake Ilmen, capturing Staraya Russa and the southern column was driving toward the borders of Latvia. On the southern Ukraine front, the Russians had more difficulty in their attacks on the strong German defenses within the Dnieper bend. A German counteroffensive, started in mid-January, was launched against Russian positions north of Vinnitsa in an effort to relieve pressure on this outpost guarding the vital Odessa-Lwow railway. Instead of fighting this offensive, the Russians decided to attack elsewhere and in a surprise manoeuvre encircled 10 German divisions in the Korsun area. The Germans could not break this trap and lost more than 80,000 men in this miniature Stalingrad, which was liquidated by Feb. 17, 1944.



It was difficult to estimate the casualties of the Russian campaign; each side tended to exaggerate the other's losses and to minimize their own. In June 1943 a Russian communiqué stated that German casualties from the start of the war totalled 6,400,000 killed and captured as against 4,200,000 Russians killed or wounded. A subsequent German statement that the Russians had lost 20,000,000 in dead, wounded and missing was dismissed as propaganda. The Russian figures corresponded roughly to an

estimate made by the British ministry of economic warfare, Oct. 15, 1943, which put German losses at 4,000,000 in dead alone. Nine-tenths of the nazi casualties, according to this estimate, were sustained on Russian battlefields. This was twice the number of Germans killed in World War I. In the summer and fall offensives, the nazis claimed that Russian casualties were 1,300,000 dead, 1,570,000 wounded and 130,000 prisoners. The Russians said German losses in this same period were 900,000 dead, 1,702,000 wounded and 98,000 captured.

IV.—THE MEDITERRANEAN CAMPAIGN

1. The Tunisian Campaign.—In Jan. 1943 the Allied offensive in North Africa, which had gotten off to a running start two months before when Anglo-American forces landed in Morocco and Algeria, appeared none too promising. In Tunisia, axis armies, capitalizing on the slowness of the Allied units in taking the field, had established excellent defense positions. In Libya, the British 8th army was engaged in a vain chase of Marshal Rommel's Afrika Korps. The shrewd "desert fox" kept one step ahead of his pursuers and managed to keep his armies intact while falling back to the fortified Mareth line.

At first glance, the advantages appeared to lie with the axis. While the Allies were still floundering about in the early stages of the campaign, Hitler had rushed all the men and material he could spare to his African beachhead. By mid-January, the Germans had posted in their Tunisian garrisons a well trained army of seasoned troops. Combined with Rommel's Afrika Korps the German-Italian armies numbered about 200,000 men, most of whom were veteran nazi combat troops. The striking power of the axis force was built about three crack German armoured divisions supported by a luftwaffe fleet of about 1,000 planes based in airfields in Tunisia, Sicily and Italy. The Allied armies that originally landed in French North Africa numbered about 150,000 men, and were subsequently expanded by fresh reinforcements. Another force of between 100,000 and 150,000 troops, drawn from the French armies in Africa, was also available for Allied operations, but lacked equipment. Although figures on the size of the Allied air arm were not disclosed, it was believed that the Anglo-American air forces far outnumbered the luftwaffe squadrons in this Mediterranean war theatre. In mechanized equipment too, the Allies had the edge, but with the exception of Gen. Bernard L. Montgomery's 8th army in Libya, the American and British tank crews in western Tunisia did not measure up to the Germans in experience and skill.

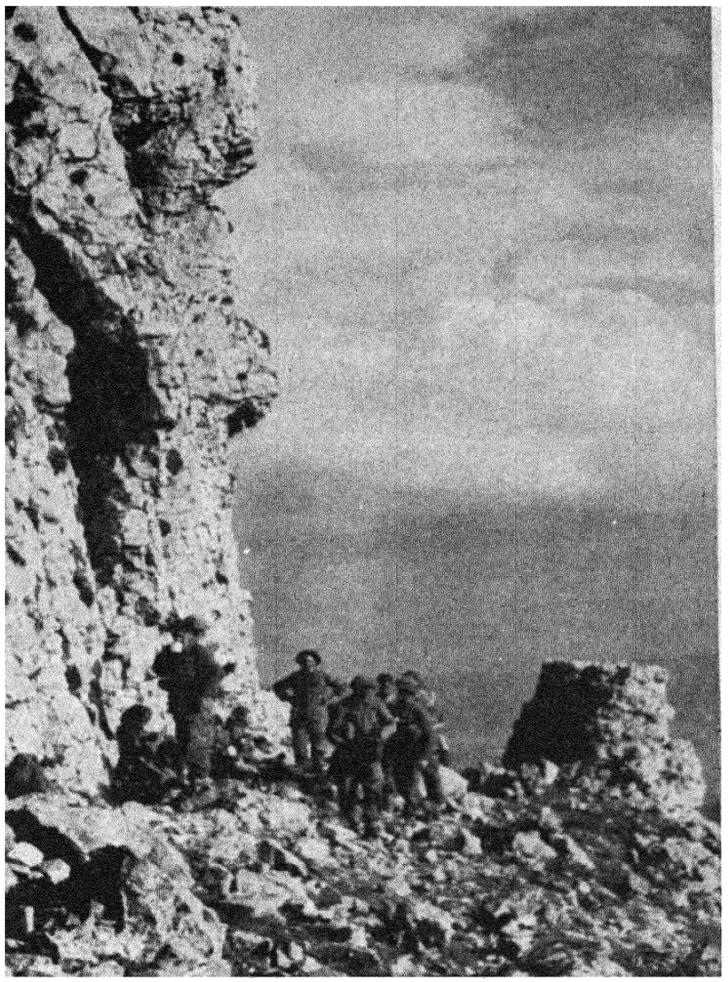
While the Germans possessed better defense positions and shorter supply routes, these tactical advantages were offset by the superior strategical position of the Allied armies. The Anglo-American-French troops under Gen. Dwight D. Eisenhower, then Allied commander of the Mediterranean war zone, had ample room for manoeuvre; whereas, the axis forces were crowded into a narrow corridor in Tunisia. The Germans dared not risk a major offensive to the west while the British 8th army threatened to bolt through their backdoor in the east.

As the year 1943 opened, the Allied and axis armies in Tunisia were sparring for position. Gen. Eisenhower's troops were deployed along a line running in a north-south direction from a coastal point 25 mi. west of Bizerte to the Djerid salt marsh on the south. The British 1st army, composed of American and British troops, held the northern flank, extending from the Tunisian coast to Mateur. The southern flank, held by the newly organized U.S. 5th army and French forces, ran from Mateur to the Djerid salt marshes.

During the first 15 days of January, operations in western Tunisia were hampered by the seasonal rains, which turned battlefields into knee-deep quagmires. In the Libyan theatre of war, the British 8th army pursued Rommel's armies in Tripolitania. By the middle of January, the 8th army was within 100 mi. of Tripoli, but its advance, though swift, was not all smooth sailing as Rommel had studded the path of his retreat with skilfully concealed minetraps which had to be cleared. On Jan. 23, 1943, Rommel evacuated the port of Tripoli, retreated into Tunisia and took up positions behind the Mareth line. A miniature Maginot defense system built by the French before the outbreak of World War II, the Mareth line was originally intended to prevent an Italian attack against Tunisia. Rommel's abandonment of Tripoli and retreat from Libya was a deliberate strategic manoeuvre. Rather than remain in the Libyan-Tripolitania sands where he risked certain defeat at the hands of a superior British force, he decided to fall back and join forces with the armies of Gen. Jurgen von Arnim in western Tunisia. He was thus able to concentrate his forces effectively to prevent the Allies from driving a wedge between the two axis armies in Tunisia.

As Rommel's troops were retreating toward the safety of sheltered positions behind the Mareth line, the axis forces took the offensive on the western Tunisian front. On Jan. 18, a strong German armoured force, spear-headed by Mark IV and Mark VI tanks attacked the French units west of Pont du Fahs. The French holding this strategic area buckled under the heavy tank assault. Allied armoured units rushed to their rescue, and the German panzers fell back. South of Ousseltia, the nazis launched another attack against the poorly equipped French detachments holding Faid, an important road pass. Again, Allied armour extricated the French from possible extermination.

Meanwhile, a third Allied armoured command, an American combat unit, smashed at Sened station, about 110 mi. south of Faid pass. Despite a furious dive-bomber attack and accurate enemy shell-fire, the Americans succeeded in taking Sened, Feb. 1, and drove within 6 mi. of the German stronghold at Maknassy.



Although the American forces had made tactical gains, they had spread themselves perilously thin over a 200-mi. battlefront extending from Medjez-el-Bab on the north to Gafsa on the south. The U.S. troops halted abruptly to remedy this situation

but before they could consolidate their positions, the Germans launched an all-out lightning drive against them, Feb. 14. Spearheaded by the big Mark VI tanks, which were fitted with 88-mm. guns, the German panzer divisions crashed through the lowlands between Faid pass and Sidi Bou Zid, virtually destroyed two U.S. armoured units and overran Allied artillery positions. Badly crippled by this surprise blow, the American forces withdrew rapidly, and evacuated Gafsa. The axis armour, following up its initial advantage, smashed boldly against the centre of the line and on Feb. 20, swept through Kasserine pass, one of the four vital mountain roads leading to the Algerian border. German mechanized columns then split in two and raced toward Algeria. This time, however, Allied armour lay in wait until the overconfident panzer crews sped to exposed ground near Thala, 25 mi. above Kasserine. Then Allied tanks, protected by air and land bombardments, launched a vicious counterattack which brought the panzers up short. This combined assault proved too much for the bewildered panzer divisions which turned tail and scooted back toward Sbeitla and Kasserine. Allied tanks gave chase and on Feb. 25, the Americans reoccupied Kasserine Gap without firing a shot. The Afrika Korps, badly mauled by these unexpected counterblows, retreated to the Sbeitla-Feriana line and the fighting subsided.

The Germans had failed in their objective—capture of Tébessa (in Algeria)—but they had inflicted a severe defeat on the Americans. The Allies lost more than 100 tanks in the Kasserine battle and their casualties were four times as large as those of the enemy. The Allies also learned several valuable lessons at Kasserine: (1) that the German dive-bomber was a formidable weapon against unseasoned forces, but was ineffective against veteran troops; (2) that armoured divisions were more effective when concentrated into sizable striking forces than when used in small and dispersed groups; and (3) that liberal sprinklings of avenues of retreat with mines and booby-traps can slow an attacking force. The application of overwhelming air power at precisely the right moment was an important factor in helping the Allies turn back the Germans at Kasserine pass. The success of the synchronized plane-tank-infantry attack in this battle set the pattern for subsequent Allied operations in Tunisia. By March of 1943 the Allied air force in the Mediterranean was united under a single command and then redivided, according to functional tasks, into tactical and strategic air forces.

By mid-March the Allies had recovered from the near-disaster of Kasserine pass and were gathering for an all-out offensive push to drive the axis out of Tunisia. The British 1st army and the U.S. 5th army (later reorganized as the 2nd American corps), which had gained in experience, and the British 8th, backbone of Allied power in Africa, were now functioning smoothly, jabbing and thrusting in alternation at the axis lines. On the northern front, the British 1st army troops were engaged in see-saw battles with the German regulars for control of the strategic hills commanding the approaches to Bizerte. On the central Tunisian front, American forces, employing the now familiar tactic of a relentless advance by infantry and tanks supported by destructive blows from the air, recaptured Gafsa on March 17 after a swift 30-mi. drive. Nearby El-Guettar and Sened fell in rapid succession and unable to weather the terrific land-and-air pounding, the axis armies fell back. While the British and Americans hammered the Germans in central Tunisia, Gen. Montgomery's 8th army breached the first of the three German defense positions in the Mareth line.

Meanwhile, the Allies poured relays of bombers over the axis lines. German airfields were plowed up and the luftwaffe's planes were destroyed, either in the air or on the ground, in such numbers that their replacement became virtually impossible. Furthermore, the luftwaffe was drained by the enormous losses entailed in the Russian campaign and the Allied bombing of plane plants in Germany. The British 8th army then launched an all-out offensive against the Mareth line, March 20. After nine days and nights of furious fighting, the 8th army troops pierced the Mareth defenses and marched into the port of Gabes, March 30. Meanwhile, Gen. von Arnim, who succeeded Rommel as commander of the axis armies in Tunisia, beat a hasty retreat via the coast road to avoid being pinned back against the Gulf of Gabes.

LONG STOP HILL (Djebel el Ahmera), a key to the approaches of Tunis, was captured by the Allies after a bitter three-day battle, April 23–26, 1943

After the Mareth battle the Allies launched a general offensive all along the mountainous Tunisian front. By April 5 they were hammering six wedges into the axis lines. On the north, Moroccan goumiers, who had captured Sedjenane and Cap Serrat, were pressing back axis units toward Mateur, an important road junction. Some 50 mi. to the south of Sedjenane a French force was slashing through German positions at Bou Arada in a drive for Pont-du-Fahs. In the Fondouk area, 100 mi. below Mateur, an American force was waging a savage battle to win heights commanding Kairouan. South of Fondouk another U.S. force cut through enemy columns near the Shott el Fedjedi. On April 7 this force effected a junction with the British 8th army which in turn was aided by a Fighting French unit that had made a 1,500-mi. trek from the Lake Chad area to join the Allied forces. The Allies then tightened their noose about the enemy forces who were being slowly strangled in the Tunisian "coffin corner." The Allies took Pichon, Fondouk and Sfax in rapid succession. By April 11 American troops stormed through Faid pass. The following day the 8th army captured Sousse. The axis line was shriveled to a mere 120 mi. in length and the Germans were fighting with their backs to the sea.

Von Arnim had hoped to make a stand at the port of Enfidaville on the coast, but the British 8th army units overran his

U.S. AMPHIBIOUS TRUCK plowing through a path cleared in a mine field on a beach near Gela, Sicily, July 10, 1943, shortly after the initial American landing forces had established a beachhead there to launch the invasion of the island. At the left is a jeep which has been destroyed by a Teller mine

positions and occupied the city by April 21. His troops were also driven from Long Stop hill, a vital defense on the road to Tunis, by the British and were fighting a losing battle against French units driving toward Pont-du-Fahs.

By the end of April the Tunisian battle was nearing its close. Thirteen miles west of Mateur, American troops cleared Djebel Tahent—Hill 609—by May 2, after an epic battle. Mateur itself fell to the Americans, May 3, and Bizerte was within range of Allied guns.

As the Allied armies were poised for the final kill Allied bombers and fighters made 2,500 sorties on May 6 over Tunisia and Sicily, pounding the reeling axis forces and supply lines. Stunned by the impact of the bombs and exploding shells fired at them by massed Allied artillery, the Germans staggered in retreat toward the sea. The following day, May 7, British, American and French forces smashed through the German lines. American troops captured Bizerte and grimy bare-waisted British Tommies marched into Tunis. The remnants of the axis forces fled toward Cap Bon with British armoured divisions in hot pursuit. Further axis resistance was both futile and impossible. On May 12 Gen. von Arnim surrendered and the battle for Africa had ended. Besides von Arnim, 16 other generals were taken prisoner and more than 200,000 axis troops, the majority of them Germans, were captured by the Allies.

2. Pantelleria and Sicily.—After driving the axis out of Tunisia, the Allied high command prepared to invade southern Europe via Italy, the weak link in Hitler's chain of fortifications girdling the continent. Three considerations governed the Allied decision to attack by way of Italy rather than western Europe. One was the flaccid morale of the Italian people. A second was the necessity of clearing the Mediterranean, which would shorten the distance of convoy shipments to the Allied bases in Africa. A third was the fact that German supply lines to the Italian boot were long and extenuated; in contrast nazi communications to possible invasion points in western France, Holland and Belgium were short and easily negotiated.

In order to invade Italy, the Allies first had to eject axis forces from the Mediterranean islands of Pantelleria, Lampedusa, Linosa and Sicily. As long as these outposts remained in axis control, Allied shipping in the Mediterranean was unsafe.

The reduction of Pantelleria was the first step in the Allied strategy of clearing the Mediterranean. This rockbound isle, 45 mi. square, was studded with heavy coastal guns, underground barracks and hangars, and was garrisoned by a force of more than 11,000 Italian troops. Strategically, Pantelleria was a stopper in the Mediterranean narrows and its role was to prevent passage of Allied shipping.

On May 20, 1943, the Allies started an aerial attack on Pantelleria. For 20 days and nights streams of bombers shuttled over Pantelleria dropping a tremendous weight of explosives on the island. In the last 13 days of the attack some 8,000 tons of bombs hit Pantelleria. On June 10, the heaviest day of the bombardment, Pantelleria was rocked by 1,500 tons of bombs. The Italian garrison found the air blitz unendurable and it surrendered on June 11. The following day Lampedusa gave up and the tiny force holding Linosa capitulated on June 13.

While some military theorists regarded the knockout of Pantelleria as proof that air power by itself could win a decision in war, others pointed out that special conditions enabled air power to win a victory in this battle. They maintained that the island fell because it was possible to isolate it completely from supporting mainland bases. These sources emphasized that Malta in three years of war had taken many times the weight of bombs dropped on the Italian outpost; but it survived because its supply lines were never severed.

The conquest of Pantelleria advanced the Allies toward their next objective—invasion of Sicily. Nearly 200 times the size of Pantelleria, Sicily had excellent ferry connections with the mainland and was dotted by 18 or 20 airfields. In addition, three or four more airfields on the toe of Italy were within easy fighter range of Sicily.

After Sicilian airfields, ports and railways had been thoroughly saturated by Allied bombings, an armada of 2,500 vessels, including warships, set out for the southern shores of Sicily. Covered by an intense sea-and-air barrage laid over axis defenses on the island, thousands of American, British and Canadian troops swarmed onto the southern shores of Sicily before dawn, July 10, 1943.

Gen. Eisenhower, who was in command of the Sicilian operations, divided his invasion forces into two armies, each numbering about 100,000 men. One, the 8th army, which included Canadian as well as British forces, led by Gen. Montgomery, landed on the southeast tip of Sicily; the other, the American 7th army, led by Gen. George S. Patton, Jr., landed at the southern shore. While the landings were successful, they were not unopposed and the Americans wading ashore at Gela, a small Sicilian port, had to battle hard against fierce German tank attacks which nearly drove them from several of their beachheads.

By July 12 the Allied forces had solidly established several bridgeheads on the island. The American 7th army controlled 70 mi. of the south coast. The British had won a 30-mi. stretch of the east shore and Canadian marines had won a foothold in between. The Allied forces then drove forward. The U.S. armies split up; two columns sped inland to the north, a third raced along the southern coast. The Italians offered little resistance to the spirited drive of the American troops, who by July 22 had captured Palermo, capital of Sicily, and had cut off the Italian forces on the western half of the island from German armies on the eastern half.

Although the British had captured Syracuse and Augusta by July 15, their drive in eastern Sicily was slowed by stubborn nazi resistance. The coast road to Catania, a port at the base of Mt. Etna, was narrow and it became clear that the Germans could hold it against a frontal assault. In order to dislodge them from these strong, natural positions, other British forces, as well as Canadian and U.S. troops released by the quick mop-up in western Sicily, started a drive to flank the German lines west of Mt. Etna. Allied progress was slow, as the Germans bitterly contested every foot of ground and littered the path of their retreat with countless minefields. They repelled several British attempts to break through the Catania bottleneck, but withdrew when Canadian troops, driving around the western slopes of Mt. Etna, threatened to snap off their communications with the Messina ferry to the north. The nazis retired from Catania on Aug. 5, and quickened their withdrawal toward Messina, the port closest to the Italian mainland and their most convenient escape exit.

Meanwhile, American, British, Canadian and French troops, as well as Moroccan Goums, launched a combined offensive toward Messina. Axis rearguard troops fought resolutely, but by Aug. 12, they were crowded into a narrow and untenable strip in the northeast corner of the island. Unable to halt the fierce Allied drive, the Germans evacuated what troops they could from Messina to the Italian mainland and on Aug. 17, U.S. forces captured Messina, thus ending the campaign of Sicily.

Although the Allies had conquered Sicily in the comparatively short space of 39 days, they suffered heavy casualties. The British lost 11,835 dead, wounded and missing, while American casualties were 7,400 and Canadian losses 2,388. Axis casualties were estimated at 30,000 killed and wounded and 130,000 captured. The entire axis force at the start of the campaign consisted of 10 Italian and 4 German divisions totalling between 150,000 and 200,000 men. But from the very beginning of the invasion the Italians showed little heart for fighting and the entire burden of the defense of the island fell on the German forces, who were eventually outnumbered four or five to one.

3. Invasion of Italy.—While the Sicilian operation was merely an outpost battle in the Mediterranean, it enabled the Allies to establish an advanced base of operations for the attack on Italy. The basic objective in Allied plans was to knock Italy out of the war, thereby reducing the nazi foothold in the Mediterranean. Their secondary aims were to secure land bases for eventual operations against southern France and the Balkans and to establish advanced airfields from which to extend the Allied air offensive against the industrial vitals of Germany.

Heavy and increasingly destructive air raids over strategic and tactical targets in Italy preceded the actual land operations. Even before the Sicilian campaign had ended Allied bombers were hammering harbours and communications, destroying luftwaffe airfields and smashing Italian railways, upon which the Germans relied to speed men and material to any threatened point.

By mid-July 1943 the air blows on Italy rose in true Wagnerian crescendo. Bombers of the Allied strategic air force were reported to have reduced the cities of Genoa, Venice, Trieste, Leghorn, Naples, Taranto, Bari, Brindisi, Milan, Turin, Bologna and Florence to rubble. Meanwhile the tactical air force swarmed over the boot of Italy, wrecking ammunition dumps, setting fire to oil depots, smashing railway rolling stock and freight yards and bombing and strafing axis troop concentrations. This gigantic softening-up process came to a head on July 19, when 500 American planes attacked Rome—the first raid on the Italian capital since the war began. The attacking craft, carefully avoiding cultural and religious monuments, blasted a specific target—the city's railway marshalling yards. Rome, as the seat of fascism and a rail centre, was a legitimate target for air attack.

The Italian people, who had not expected that air warfare would be brought to their soil when Mussolini had cast his lot with Hitler in June 1940, were now appalled by the widespread destruction caused by Allied bombings. They clamoured so insistently for peace that the fascist regime was no longer master of the situation and Mussolini was ousted from power, July 25, 1943. Meanwhile Gen. Eisenhower offered peace terms to Mar-

U.S. 5TH ARMY TROOPS halting momentarily in Naples while a labour corps clears away debris of bomb wreckage

shal Pietro Badoglio, the duce's successor, and the Allies temporarily suspended their air offensive while the new Italian government pondered the offer. Badoglio, however, was not able to persuade his German allies to leave Italy—a basic condition of Eisenhower's terms—and on July 31 the Allies warned that they would resume their bombings.

As a result, an estimated 3,000,000 Italian people fled from the urban centres to havens in the countryside. On Aug. 13 Rome was raided again and 500 tons of bombs were dropped on the city's two railroad yards. After this aerial attack, Badoglio declared Rome an open city, but Allied authorities rejected this unilateral declaration, demanding investigation by neutral authorities to determine whether Rome had been demilitarized. The Italians failed to heed the Allied demand.

Thenceforth, the Allied bombers concentrated on destruction of railways and aerodromes in the Italian boot. By Aug. 24 the railway system in southern Italy was virtually paralyzed and the enemy airfields were so thoroughly plowed up by bomb craters that the luftwaffe was compelled to fall back to bases in central Italy. Although the main blows against rail communications were in southern and central Italy, rail targets in the north were not immune from attack. On Sept. 3 a formation of U.S. bombers crippled rail traffic from the Brenner pass into Italy by bombing the line at Bolzano, Trento and Bologna. This attack was the finishing touch to Allied pre-invasion air blows against Italy's railway communications. On this same day the invasion began. Units of the British 8th army, containing Canadian as well as British troops, crossed the 2-mi.-wide water-gap separating the Sicilian port of Messina from the Italian mainland, established a beachhead in Calabria and occupied the towns of Reggio di Calabria and San Giovanni a few hours after landing.

The British 8th army met no resistance from the Italians—who surrendered in droves—as on the same day Marshal Badoglio had agreed to Allied terms to cease fighting. Five days later, on Sept. 8, Badoglio accepted Gen. Eisenhower's terms for unconditional surrender, under which the Italians agreed to give up their fleet, and Italy dropped out of the war as an axis partner. Reacting energetically to halt the deterioration of its military position in Italy, the German command poured thousands of reinforcements into the peninsula and on Sept. 10 German forces under Field Marshal Albert Kesselring occupied Rome after a battle of a few hours. In northern Italy, Field Marshal Rommel re-emerged on the scene of Mediterranean warfare. He seized the principal cities, rapidly subdued what little resistance the Italians offered and soon brought all strategic points under nazi control. At the same time the Germans announced that Kesselring had been put in command of their forces in central Italy and that Rommel, the "desert fox" of African fame, had been placed in charge of nazi armies in northern Italy.

While the alert German reaction to the armistice announcement saved the day for Hitler in central and northern Italy, the greater part of the Italian fleet escaped and surrendered to the British at Malta and Gibraltar. By Sept. 15 some 100 Italian warships, including five battleships, were in Allied hands. Although the Allies could not hope to use the Italian fleet against the Germans for some time, its surrender freed a large portion of Allied naval forces in the Mediterranean for duty elsewhere.

On Sept. 9, 24 hours after Italy's capitulation, units of the Allied 5th army landed on a beachhead below Salerno. The Allied strategy was to lure the Germans into rushing troops to meet the British 8th army in the south of Italy. Once this was accomplished, the Allies planned a landing to the north and a consequent quick dash across the waist of Italy to the Adriatic to cut off the German divisions in the south. In order not to alarm the Germans, announcement of the armistice was withheld until Sept. 8. The Germans, however, suspected a trap and refused to be drawn into it.

The landing on the Salerno beachhead was preceded by a naval barrage of considerable intensity. Both American and British troops, of the Allied 5th army, led by Lt. Gen. Mark Wayne Clark, quickly clambered up the beach at 3:30 A.M. on Sept 9, only to find that the Germans were thoroughly prepared for their arrival. The first Allied troops to go ashore were cut to pieces by deadly patterned fire from concealed batteries of 88-mm. cannon and machine guns. Those that reached dry land were driven back by big German Tiger tanks and the beach became littered with Allied dead and dying and wrecked equipment. The Allied forces returned that night and established a bridgehead under a protective barrage from warships off shore while additional troops and supplies were landed the next morning. By Sept. 14 the British and American troops were established on a 25-mi.-wide strip of beach extending from Salerno to Agropoli on the south. Their position was by no means secure and they battled with their backs to the sea. While American and British warships kept up an incessant bombardment of the German lines above the beaches, all types of Allied aircraft were summoned to help the battered Allied troops on the beachhead below. They raked the German lines from end to end, rooting out the 88's camouflaged in the forests, spraying death on concealed machine-gun emplacements and accurately bombing enemy trucks and railway rolling stock.

This scorching assault from the air combined with a vicious shelling of German lines above the beaches by Allied warships and the stubborn refusal of the 5th army troops to yield their positions, turned the tide of the Salerno battle. By Sept. 15, after 150 hours of continuous fighting, the Germans started to withdraw from the Salerno salient. The following day the 5th army took the offensive, driving the Germans from the wide pocket between the Sele and Calore rivers. By Sept. 18 the British 8th army, which had been sweeping up the Adriatic coast turned part of its columns inland, effected a junction with the bruised 5th army and all Allied holdings in Italy were welded into a single front.

The Salerno battle was a Pyrrhic victory for the Allies at best. The casualties entailed—the U.S. forces alone lost 3,497 in dead, wounded and missing—in the first week of fighting were high and the nazis succeeded in fighting a delaying action that enabled Rommel and Kesselring to secure a firm grip on central and northern Italy.

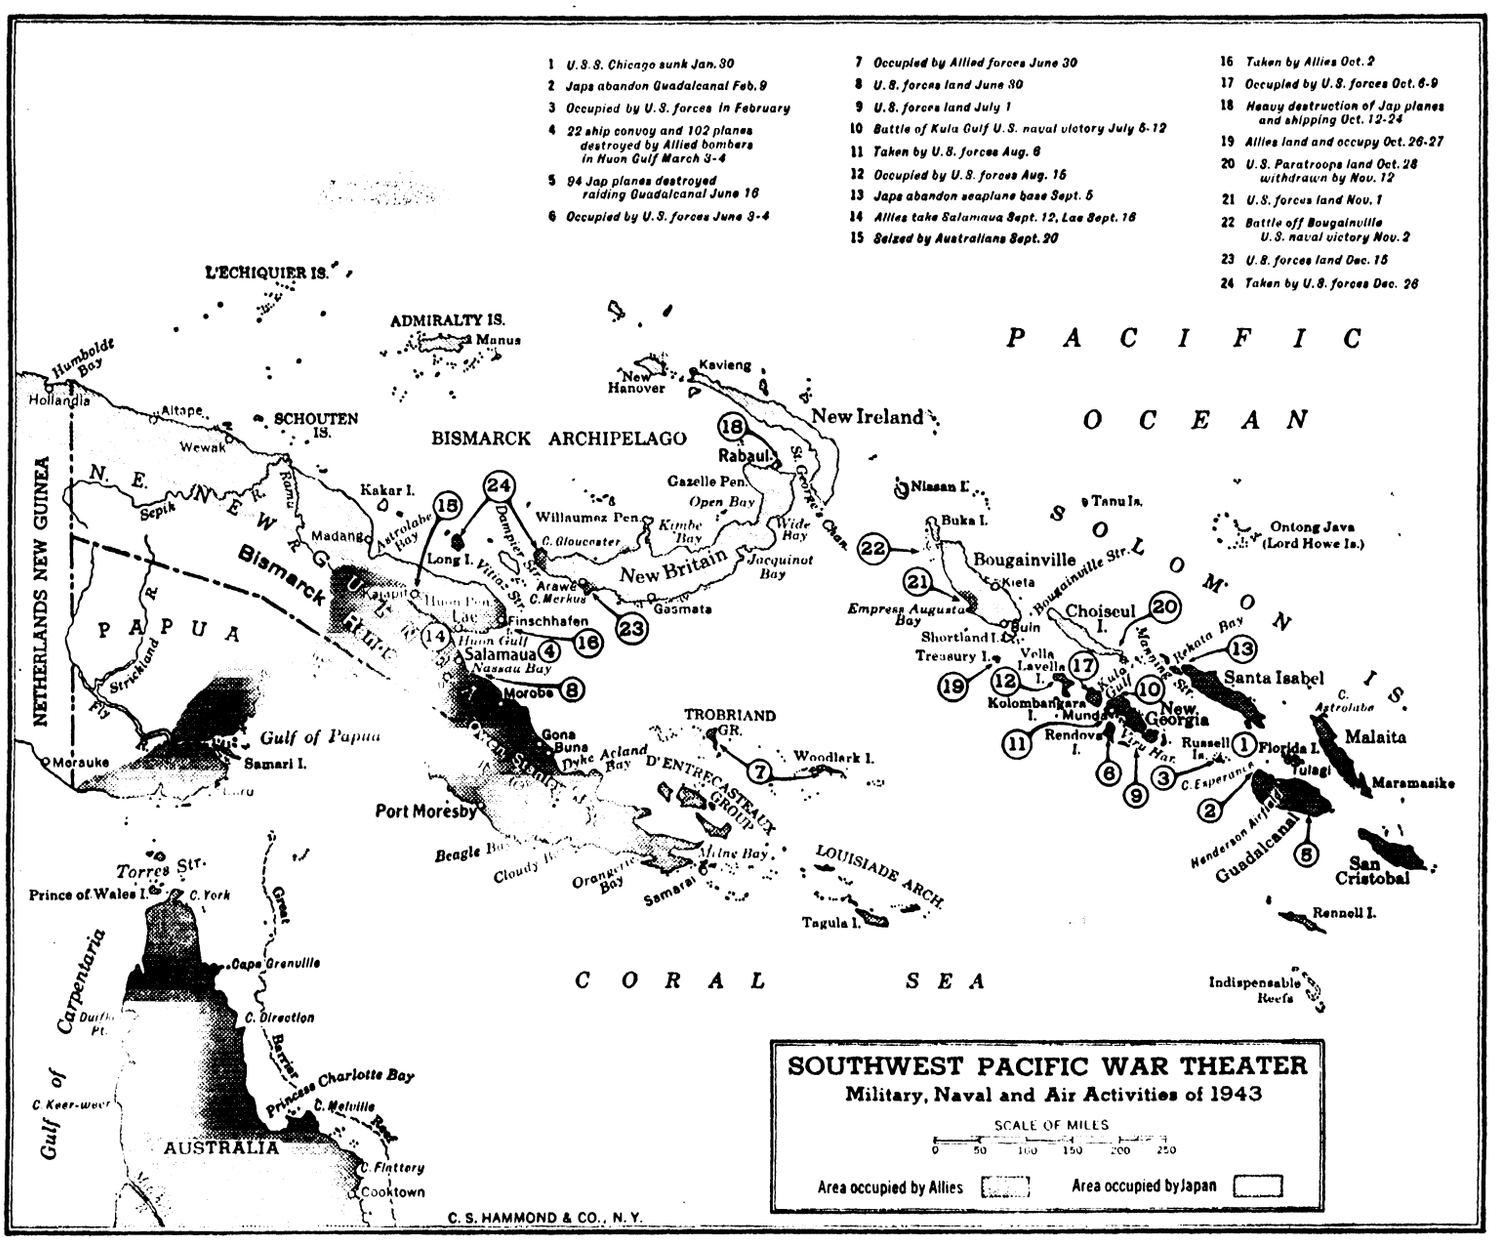
At this stage of the campaign in Italy the Allies controlled the lower portion of the Italian boot. The Germans held Naples and virtually all Italian territory north of the city. Marshal Kesselring had about eight divisions massed for the defense of Naples and the road to Rome; by the end of the year this force was augmented by several armoured divisions. Rommel had another 15 to 20 divisions in northern Italy. Meanwhile, German forces in Sardinia, attacked by two Italian divisions, had evacuated the island and a French army under Gen. Giraud invaded Corsica on Sept. 14 and cleared all German troops from the island by Oct. 5.

After Salerno the Allied 5th army, aided by strong air support, swung around the Sorrento peninsula and occupied Naples on Oct. 1. On the Adriatic front, the British 8th army keeping pace with the Allied 5th army's advance, captured the great Italian air base of Foggia, Sept. 27, after a swift 25-mi. lunge over flat terrain. From Foggia, with its network of 13 airfields, Allied bombers were brought within striking distance of cities in southern Germany, Austria and the Balkans.

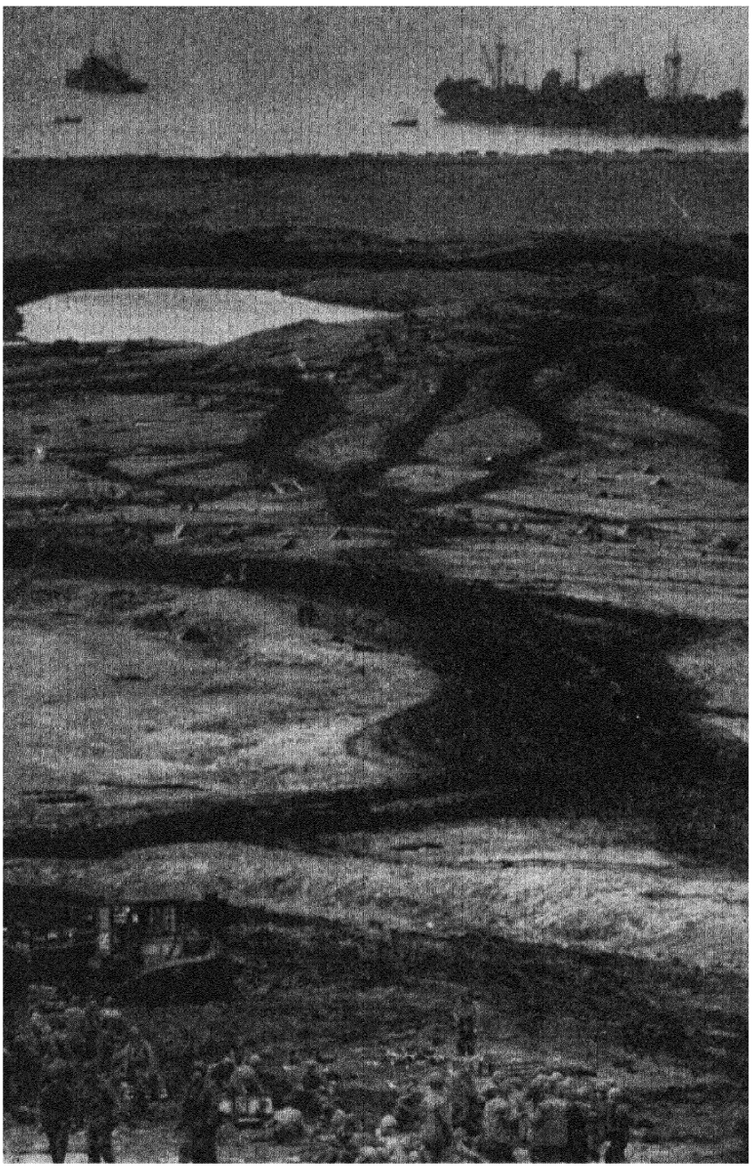
The Italian front hardened rapidly after the fall of Naples. The battle line, about 125 mi. long, stretched across the breadth of Italy from the Tyrrhenian to the Adriatic. The German "delaying action" strategy was aided by the rugged mountain terrain and the continuous autumn rains which bogged down Allied mechanized equipment and mired airfields. The Allied 5th army, holding the western section of the front, had succeeded by mid-October in crossing the Volturno river. The British 8th, holding the eastern sector, also made small gains. Expert in the strategic use of terrain for defensive operations, the Germans slowed the Allied advance to a walk by the winter of 1943–44. Their defense system was so arranged that it could be maintained by a relatively small number of troops. German artillery fire was expertly sighted while machine guns and mortars were artfully camouflaged in the heavily forested Apennines. By the end of the year the Italian campaign had settled down to a dreary repetition of the trench warfare of 1914–18, with neither side strong enough to effect a decisive breakthrough.

In an effort to break this deadlock, the Allies made a new landing below Rome on Jan. 22, 1944. British and American troops, supported by warships and planes, established beachheads on the Tyrrhenian coast about 30 mi. south of Rome, captured the port of Nettuno and then drove inland. They met little resistance during the first 48 hours, but the Germans rapidly reinforced their troops in this area and by March 1, the Allies were having difficulty in maintaining their new bridgehead.

Of some assistance to the Allied cause were the Italian guerrilla units operating behind German lines in central and northern Italy. Their activity was restricted, however, by the smallness of the territory in which they operated. The Badoglio government's declaration of war against Germany on Oct. 13, 1943, brought some recruits to the guerrilla detachments, but most of the Italian soldiers, dispirited by three years of futile service under the fascist regime, simply threw away their arms and returned to civilian life.



4. Balkan Operations.—A resurgence of activity among the guerrilla armies in the Balkans, notably Yugoslavia, attended the Allied invasion of Italy. Upon the surrender of the Badoglio government, the Yugoslav guerrillas attacked axis forces throughout the coastal areas. Their vigorous burst of activity forced Hitler to maintain troops in the Balkans badly needed elsewhere. The strength of the Yugoslav effort, however, was sapped by bitter factionalism that frequently flared into open civil war between the rival guerrilla forces. The Chetniks, led by Gen. Draja Mikhailovitch, numbered about 25,000 men and supported King Peter. They were sworn enemies of the partisan armies of Gen. Josip Brozovich, or Broz, known as Drug (Comrade) Tito, who rejected Peter. The partisans numbered upwards of 150,000 troops, were reported to be far more effective as a military force and carried the brunt of the fighting against the axis armies.



After the Allied invasion of Italy was underway, an Allied military mission went to Yugoslavia and served at the headquarters of both Tito and Mikhailovitch. Their purpose was to co-ordinate Yugoslav guerrilla activities with Allied strategy. At that time, the partisan armies were swarming through the Dalmatian coast. By the end of September they had occupied the key ports of Split, Susak and Senj and were launching fierce attacks on Trieste, Fiume and Dubrovnik. The German-Croat-Ustachi garrisons sent out frantic appeals for help; the nazi high command responded by rushing four divisions to the threatened areas to stave off the partisan blows. By Oct. 1 the Yugoslav partisans were battling the German troops over a wide front. Tito's forces slashed into the outskirts of Trieste, encircled Zagreb, disarmed the Italian garrison at Fiume and engaged German armies at Split and Susak. The partisans, however, ran short of ammunition and subsequently evacuated Split, Fiume and Susak. As a result of the widespread guerrilla raids, the Germans were required to exert nearly as great an effort against the Yugoslavs as against the Allies in Italy. Twenty-one divisions, 12 German and 9 Bulgarian, were engaged against the Tito forces who threatened to overrun Yugoslavia's main east-west communication line.

Toward the end of October, a German offensive against Marshal Tito's armies was underway. By Dec. 1943 Marshal Tito's units had lost most of their Adriatic coastline to Marshal Rommel, who had been given command of the Yugoslav as well as the north Italy front. The partisan front in Dalmatia dissolved under the superior firepower of the nazi panzers and most of the guerrillas fell back to the interior. Deep inland there was no front line, and the war was made up largely of swift guerrilla actions by partisan bands.

Marshal Tito's greatest handicap was lack of sufficient ammunition to fight a long, pitched battle. Frequently his armies were compelled to withdraw from engagements nearly won because their bullets had run out. The partisans had few tanks, little artillery and no anti-tank or anti-aircraft guns. On many occasions they refrained from occupying cities because they lacked means to defend them from German bombers.

Guerrilla forces were also active in Greece, but again deep-seated political quarrels between democratic elements and royalists caused internecine strife and sapped the strength of the Greek guerrilla bands. As in Yugoslavia, periodic outbursts of civil war flared between the two factions and prevented establishment of a cohesive anti-axis front. The E.D.E.S. (Greek National Democratic army) fought spirited battles against a rival guerrilla army, the E.L.A.S., directed by the Greek Front of National Liberation. The E.L.A.S. faction charged that the E.D.E.S. group, which leaned toward King George, had attempted to negotiate an armistice with the German occupation authorities. The E.L.A.S., representing elements

U.S. TROOPS making the initial landing on Attu island May 11, 1943, as Japanese defenders retreated to the hills

further to the political left, were believed pledged to a policy of ousting King George and establishing a republican regime. The fighting between the two bands became so bitter that Gen. Sir Henry M. Wilson was compelled to intervene. He ordered both sides to cease quarrelling and to present a united front against the German occupation forces.

A third front in the Mediterranean was opened in Sept. 1943, when British forces invaded the Dodecanese islands strung off the coast of Turkey. Allied control of these islands in the Aegean threatened to outflank the vaunted "iron ring" of German defenses in the Balkans from the east as the Allied invasion in Italy had outflanked them from the west. The initial British invasion efforts were successful and on Sept. 21 a British communiqué said that the key isles of Cos, Leros and Samos had been won.

The wehrmacht, however, was determined to reconquer the islands, which were far closer to German bases than to Allied supply sources in the middle east. The Dodecanese were only 50 and 100 mi. respectively from German-held Rhodes and Crete, but were at least 350 mi. distant from Cyprus, the closest British base. Thus the islands were within radius of German fighter planes but far beyond the radius of British fighter strength. Furthermore, the British occupation depended largely on the willingness of the Italian garrisons on the islands to participate in the fighting against their former allies.

The Italians, however, refused to co-operate and surrendered passively to the Germans who launched their counterattack on Oct. 3, 1943. In operations bearing a striking similarity to the successful nazi airborne invasion of Crete in May 1941, German parachutists and airborne troops, covered by aircraft and warships, landed on the three disputed islands and completely reconquered them by Nov. 22, 1943. The British attempt to seize the Dodecanese was criticized as a foolhardy venture in view of the fact that the air force was not able to give close support to the landing troops.

V.—THE BATTLE OF THE ATLANTIC

In early 1943 the U-boat campaign against Allied merchantmen plying the North Atlantic had reached a crisis. The German "wolf packs" were inflicting enormous losses on United Nations shipping and the Allies apparently were powerless to prevent it. Hitler's undersea raiders had sunk an average of 1,000,000 gross tons of shipping a month in 1942. The U-boats were torpedoing and sinking bottoms at such a rapid rate that combined U.S.-British construction in 1942 hardly offset the losses. The situation had become so grave that the U.S. and British governments had clamped an air-tight censorship on news of U-boat sinkings. This "silent" policy was evidently initiated in all good faith to conceal losses from the enemy; at the same time, however, it also prevented public opinion in the United Nations from realizing the gravity of the battle of the Atlantic. Obviously, the entire Allied war effort was in jeopardy. As long as the U-boat could disrupt sea communications at will, the Allies could not launch a full-scale offensive against Hitler's European fortress.

New measures to combat the German undersea raiders were imperative and in March 1943 U.S., British and Canadian officers met in Washington. They overhauled and renovated their anti-submarine campaign, scrapped older and traditional techniques for more modern methods in which air power played a more prominent part. On April 30, 1943, it was disclosed that Canada and Great Britain had been given full responsibility for convoying merchant shipping through the North Atlantic to British ports. Under this plan, U.S. and Canadian long-range bombers provided an air umbrella to an unspecified point somewhere in the mid-Atlantic; at this point British bombers took over and herded the convoys into United Kingdom ports.

This airguard over the full route proved extremely effective. U-boat sinkings, which, according to German high command reports, were 851,000 tons in March, fell to 415,000 tons in April and to 372,000 tons in May. In the month of June the German admiralty admitted that only 107,000 tons of Allied shipping were sunk. At the same time, the destruction of U-boats rose in inverse ratio to the decline in sinkings. The British admiralty announced in May that the number of submarines sunk exceeded output in that month, and in August President Roosevelt and Prime Minister Churchill revealed in a joint statement that axis submarines were sunk at the rate of one a day between May 1 and July 31, 1943.

By the fall and winter of 1943 the U-boat warfare waged by the Germans in the Atlantic was no longer a major problem. The German submarine command, striving to compete with the successful Allied strategy, developed new methods of attack. Anti-aircraft guns were installed on the undersea craft and the Germans used long-range aircraft to spot convoys and aid in concentrating U-boats against them. The new tactics were notable for their failure. On Dec. 9, 1943, Roosevelt and Churchill, in another joint statement, said that the number of U-boats destroyed exceeded the number of ships sunk. They also asserted that Allied merchant ship losses in November were the lowest of any month since May 1940.

One of the newer techniques used in protecting convoys and hunting down the U-boats was the pocket aircraft carrier. Planes based on these "baby flat-tops," officially known as escort carriers, would cruise the area in which a convoy was moving. Radio-telephonic communications enabled the planes to speed to positions where submarines were sighted. The submarine generally would be compelled to go into a crash dive to escape depth charges dropped from the planes. Other factors implementing convoy protection were the employment of destroyer-escorts, long-range patrol aircraft, new detection devices and improved depth charges. Additional factors were Portugal's agreement to let Great Britain use the Azores as a naval and air base, the increase in Russian air strength in the Murmansk area and the steady bombing of German submarine bases, construction yards and factories. (*See* also SUBMARINE WARFARE.)

VI.—THE PACIFIC THEATRE OF OPERATIONS

1. Introduction.—The Allied drive to reconquer the vast territory in the Pacific lost to Japan in the first six months of the war was well underway in 1943. But the process was slow and arduous. The road to Tokyo was strewn with geographical and logistical obstacles and was defended by a tough and clever army. While the Allied forces had succeeded in reconquering a number of Southwest Pacific islands of strategic importance, the Japanese still held Burma, Malaya, the Netherlands Indies, the East China coast and some sections of the Chinese hinterland. Japan's strategy to fight a gruelling delaying action was based on the hope that the Allies would tire of a protracted war in the Pacific and eventually sue for a negotiated peace. The Allies, however, were determined to destroy Japan, but not until Germany, the stronger of the two axis powers, was beaten first. As a result, the bulk of Allied war material was sent to the European theatre of war and the launching of an all-out assault in the Pacific necessarily had to wait upon completion of the European campaign. But despite the limitations placed on their offensive power in the far east, the Allies appeared to have achieved both air and naval superiority over the Japanese by the end of 1943. These two factors were of major importance and were largely responsible for the success of Allied amphibious operations in the Pacific throughout the year.

2. New Guinea.—A huge mountainous and jungle-ridden island, New Guinea was an important war zone in 1943. Gen. Douglas MacArthur, who was in command of military operations on the island, had launched an offensive to drive the Japanese from the northern coast of New Guinea. His purpose was to win control of the strategically situated coastline on the Huon gulf, and establish a base for operations against the Japanese-held island of New Britain. This drive, which had started in Sept. 1942, was successful. Jungle-trained Australian and American troops had captured the beachhead outposts of Buna and Gona by the end of 1942. On Jan. 22, 1943, the Allied forces seized Sanananda point, thus closing the first phase of the New Guinea campaign in which a Japanese army estimated at 15,000 men was virtually annihilated. Allied casualties were approximately half that figure. As the capture of Sanananda point perilled their control of the Huon gulf, the Japanese strove to redress their weakened position in New Guinea. In February a dozen Japanese troop transports, protected by a destroyer flotilla, sailed into the Bismarck sea, presumably to land troops on the Huon gulf. Allied scouting planes, however, sighted the convoy as it sneaked along the New Britain coast and a huge force of Allied bombers intercepted it. After a spectacular battle, the Allied planes destroyed the entire Japanese convoy, consisting of 10 warships and 12 transports. Some 15,000 Japanese aboard the vessels met their death by drowning or by the murderous strafing from the Allied planes. The

battle of the Bismarck sea, March 2-5, was a decisive victory of land-based aeroplanes over warships and crushed the Japanese hopes of re-conquering the Huon gulf area.

These successes in New Guinea and similar victories in the Solomons gave the Allies new springboards from which to launch new attacks on the Japanese bases in the Southwest Pacific. On June 30, 1943, the Allies opened a major offensive in both New Guinea and the Solomons to extend their grip on the arc-shaped island chain circling Australia's north coast. In New Guinea an Allied amphibious force landed at Nassau bay in an offensive aimed at Salamaua and Lae. Two months later another amphibious unit landed in the rear of both of these bases, completely isolating the Japanese garrison in this area. The Allied troops then systematically chopped up the trapped enemy forces and captured Salamaua, Sept. 12 and Lae, Sept. 16.

Occupation of these key bases enabled MacArthur to widen the target area of his fighter-planes and to give better air cover to his troops advancing up New Guinea's northern shoreline. Meanwhile, medium and long-range bombers intensified their attacks on the New Guinea bases of Finschhafen and Sattelberg. Land troops, moving steadily forward against bases shattered by Allied air blows, occupied Finschhafen, Oct. 2, and captured Sattelberg village, Nov. 26. The elimination of the scattered Japanese outposts in this New Guinea area enabled the Allied air forces to focus all their attention on the Japanese base of Rabaul, second in importance to Truk. MacArthur's next move was to neutralize Rabaul and air power was the weapon selected to accomplish this task. The air offensive against Rabaul and the neighbouring airfields and bases at Arawe, Gasmata and Cape Gloucester was launched in the autumn of 1943. Rabaul was pounded remorselessly; when it was adequately "softened," U.S. army troops invaded the southwest coast of New Britain Island on Dec. 15, 1943, and occupied the village of Arawe and its adjacent airfields after a few days of hard battle. Ten days later a detachment of U.S. marines landed in the Cape Gloucester area of New Britain on the island's northwestern tip. By the end of the year, the U.S. forces were pressing a hard drive to exterminate Japanese resistance on the island and to capture Rabaul.

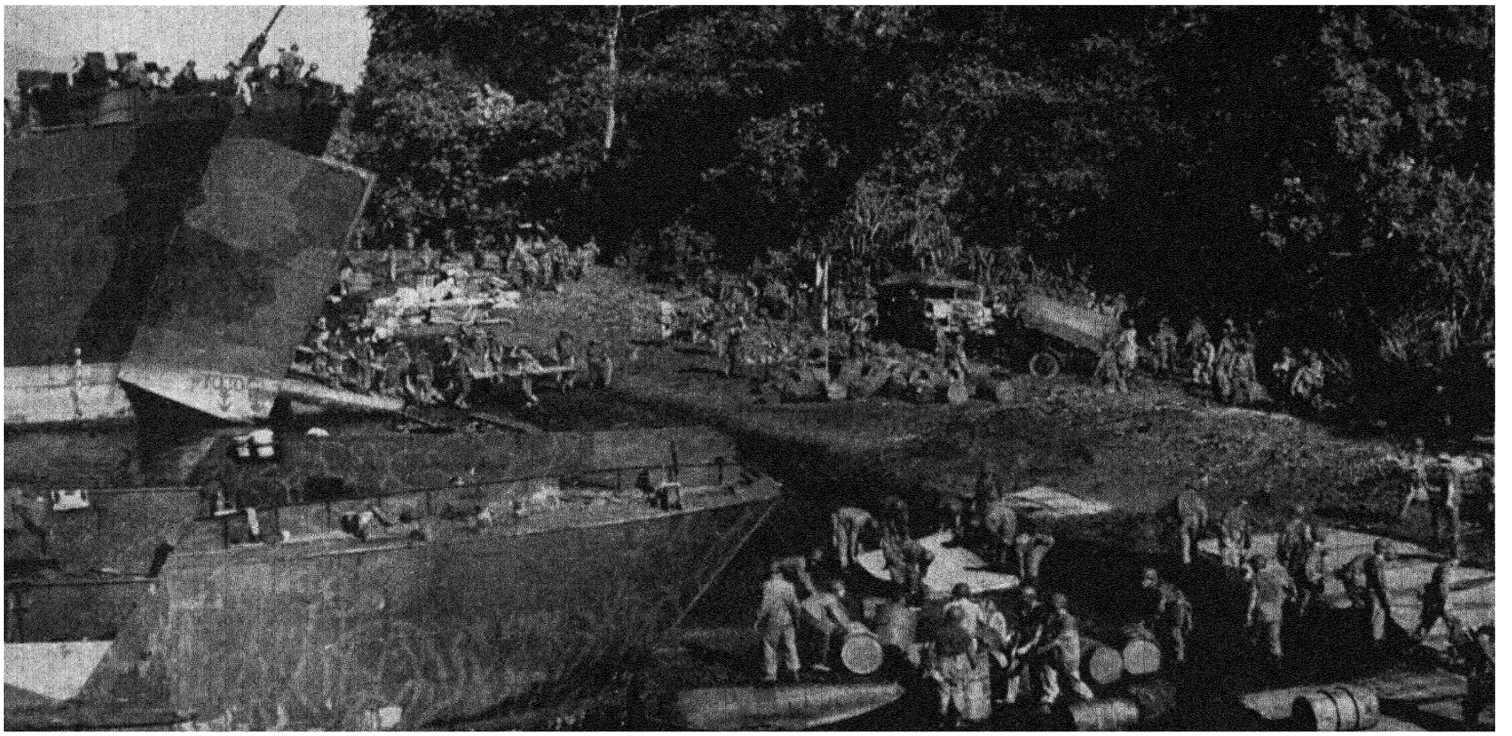
3. The Solomon Islands.—The nip-and-tuck battle for control of the Solomons, a typical South Sea cluster of coral reefs and dank malaria-ridden islands, resolved itself in the favour of the American forces in 1943. After the decisive defeat of the Japanese naval forces in the battle of the Solomons in Nov. 1942, the U.S. regular army troops and marines drove the Japanese from Henderson field on Guadalcanal. By Feb. 10, 1943, the Americans had completely cleared the island of Japanese and the arduous six-month campaign had ended in a victory for U.S. arms.

After the Guadalcanal campaign, the Allied commanders, Gen. MacArthur and Admiral William F. Halsey, commander of Allied armed forces in the South Pacific, decided on a co-ordinated drive from both New Guinea and the Solomons. Their goal was to reduce the fortified enemy zones that protected the Japanese base at Rabaul. These zones consisted mostly of airfields located at strategic sites on both fronts and their destruction was imperative for the safety of an Allied offensive. This new double-barrelled offensive was opened June 30, 1943, four months after the conquest of Guadalcanal. While Gen. MacArthur's men pressed forward on the New Guinea coast, the troops under Adm. Halsey's command invaded new island groups in the Solomons north of Guadalcanal. The Americans quickly seized Trobriand and Woodlark Islands, wiped out the Japanese garrison on Rendova and then crossed the narrow water gap to land on nearby New Georgia Island where they established secure bridgeheads under protection of a barrage from shore and naval guns.

The battle for New Georgia followed closely the pattern of the fighting for Guadalcanal. The Japanese fleet attempted to block the American landing forces but was soundly thrashed in the two battles of Kula gulf, July 6 and 12. Japanese resistance was stubborn in the initial phases of the New Georgia campaign, but weakened under the constant pressure brought to bear by the attacking forces. By Aug. 5 the Americans had won the coveted Munda air strip and by Aug. 26 all organized resistance on New Georgia had ended. Meanwhile, U.S. forces clamped a tight air and sea blockade around another island cluster—Arundel, Kolombangara, Vella Lavella and Santa Isabel—and cleared out all enemy troops by Oct. 15.

After the conquest of the central Solomons, Adm. Halsey lost no time invading the northern Solomons, where the remainder of Japanese strength was concentrated, and on Oct. 27, U.S. marines landed on tiny Mono and Stirling islands in the Treasury group. The following day, a larger force invaded Choiseul, but the Japanese withdrew rapidly without giving battle. The Choiseul landing set the stage for a larger operation, the invasion of Bougainville, where the Japanese at one time reportedly had a garrison of 40,000 men. On Oct. 31, a force of U.S. marines landed at Empress Augusta bay on Bougainville and were solidly entrenched on the island, and moved inland. By Feb. 15, 1944, the Allies had taken the Green Islands at the northern tip of Bougainville and started mopping-up operations against the 22,000 Japanese isolated in the central Solomons.

4. The Pacific Islands.—The success of the combined operations in New Guinea and the Solomons facilitated the next step in the Allied offensive in the Pacific—the flanking of Truk Island, Japan's major naval base in the South Pacific. The hub and heart of a concentric system of island bases, Truk was the Japanese equivalent of Pearl Harbor. A powerfully defended bastion, it guarded the Pacific lanes to the Japanese mainland. Its destruction was imperative as long as the Allies clung to the strategy of island-by-island conquest.



The drive to wrest the mid-Pacific islands from the Japanese had small beginnings. It started with the landing of U.S. troops on Funafuti, an Ellice island, in early 1943. This move brought U.S. bombers closer to the Japanese-held outposts in the Gilbert, Marshall and Caroline Islands. After a long softening process by bombers and warships had battered the Japanese defenses, U.S. marines and army troops invaded the Makin, Tarawa and Abemama atolls in the Gilberts, Nov. 20, 1943. Makin and Abemama fell easily to the attacking forces but Tarawa proved to be the costliest victory in the history of the U.S. marines. Of the several battalions that had to cross the exposed reefs in the initial assault on Tarawa, few survived the deadly Japanese fire. The attackers eventually gained the beach and annihilated the Japanese garrison estimated at between 4,000 and 5,000 men. The three islands were won by Nov. 23, but the conquest of Tarawa cost the marines 1,026 dead and 2,557 wounded. U.S. losses on Makin were 65 dead and 121 wounded; on Abemama, 1 dead and 2 wounded.

Striking a little more than two months after the capture of the Gilberts, a powerful army and marine force of 30,000 men invaded the Marshall Islands on Jan. 31. A far larger operation than the Gilberts, the invasion of the Marshalls was also more expertly handled. The U.S. troops had won the Kwajalein atoll in less than a week and had inflicted losses of 8,122 dead and 264 captured on the Japanese; U.S. losses in Kwajalein were only 286 killed, 82 missing and 1,148 wounded.

5. Burma.—The reconquest of Burma ranked high in Allied war plans in early 1943. Its recapture was vital if the United Nations were to accomplish their task of shipping war materials to Chinese armies in

U.S. MARINES preparing to attack Japanese positions from their bitterly-won beachhead at Tarawa. The 76-hour battle for this coral atoll in the Gilberts in Nov. 1943 was the bloodiest in the history of the marine corps

UNLOADING SUPPLIES from a U.S. naval LCI (foreground) and LST (background) at Lae, New Guinea, in Sept. 1943

quantities large enough to permit them to mount a large-scale offensive against the Japanese. But several factors militated against early realization of the Allied plans. First and foremost was the lack of sufficient offensive power of British troops stationed on the western Burma frontiers and of Chinese forces strung along the Salween river sector in northern Burma. Second, was Allied unwillingness to risk opening a new front which would consume more war supplies than could be spared while preparations were underway to launch a second front in Europe. Nevertheless, the thin trickle of supplies that was hitherto allotted this "orphaned" war zone grew into a substantial stream in late 1943 and measures were taken to further speed up the flow of military material to the Burma area. In Sept. 1943 it was revealed that U.S. army engineers had been long at work on a new supply road to China. Officially known as the Ledo road, work on the highway was protected by seasoned Chinese troops and U.S. air forces. Meanwhile, the fighting in the Burma frontier regions was limited to local engagements. Four British attempts to break through Japanese defenses on the tip of the Mayu peninsula ended in failure, and in north Burma, the Japanese neutralized the Chinese troops in the Salween river sector from mounting an offensive for a southward drive.

6. China.—There was little change in the Chinese battlefronts in 1943. The Japanese attacked frequently, the Chinese counterattacked just as often and each side claimed to have inflicted heavy casualties on the other. But under the ebb and flow of battle, two facts emerged clearly: (1) the Chinese armies were still woefully weak in arms and war supplies and lacked the power for a sustained offensive against the Japanese; and (2) the Japanese, heavily committed in holding their conquests in the Southwest Pacific, were primarily interested in holding their gains and in exploiting the economic wealth of the Chinese territory they had conquered. As the Japanese armies in China were large and well-armed, they were enabled largely to realize this goal. Acting on the military maxim that the best defense is an offense, the Japanese launched several drives in China in 1943. Their principal objective was to prevent the Chinese from massing for large-scale action and to devastate the principal rice-growing areas. In the case of the Japanese push toward Yunnan, the Japanese hoped to prevent effective Chinese concentration for an attack on Burma. In the major drives south of the Yangtze river, the Japanese aim was to keep China on the edge of starvation by devastating the "rice bowl." This fertile rice-producing area, around Lake Tung-ting, produces an annual surplus of 650,000 tons of rice. Without the crops harvested from the rice bowl, Free China would cease to exist. The Japanese opened a drive toward Lake Tung-ting in Feb. 1943. By March they had occupied important trading centres, burned granaries and interfered with planting. After a temporary setback in June, the Japanese resumed their destructive raids and again devastated large rice-growing regions.

In early November the Japanese launched another drive into the rice bowl. This offensive reached its climax in the struggle for Changteh, which the Japanese occupied Dec. 3, and then relinquished after several days of bloody fighting. In their retreat from Changteh, the Japanese systematically looted warehouses where the new rice crop had been stored and burned what grain they could not carry away with them. By the end of the year the Japanese had been cleared out of the rice bowl but not before they had accomplished their aim of destroying large quantities of rice needed to feed Free China.

7. The Aleutians.—As the U.S. was too heavily involved in war theatres scattered throughout the globe in the summer of 1942, no serious effort was made to dislodge the Japanese from their positions in the Aleutian chain of islands straddling the Bering sea. In 1943, however, the U.S. industrial machine was turning out war weapons in great quantities and the American high command decided to oust the Japanese from their Aleutian foothold. Strong forces were organized in the inner chain of the Aleutian Islands and on Jan. 12, 1943, the U.S. opened its Aleutian offensive with the occupation of Amchitka Island, only 70 flying miles from Japanese-occupied Kiska. Step no. 2 in the American offensive was the invasion by American ground forces of rocky Attu Island, May 11. After 19 days of battling fierce blizzards and determined Japanese resistance, the Americans won the island, annihilating the entire Japanese garrison, save for a few prisoners, by May 30. American planes and warships then softened Kiska, the largest and most important island held by the Japanese, with furious air and naval bombardments and on Aug. 15, a strong force of American and Canadian troops landed on Kiska. They met no opposition as all the Japanese had evacuated the island some time before rather than run the risk of annihilation.

Wrestling. With the national intercollegiate wrestling championship called off because of the war, interest in amateur wrestling in 1943 centred in the annual A.A.U. championships at New York. The host, West Side Y.M.C.A., won the team title for the third time in four years, followed closely by Cornell (Ia.) college and Michigan State college. Cornell's three-man team scored 13 points to tie Michigan State for runner-up honours. New champions were crowned in all weight divisions, although several 1942 titlists, including Douglas Lee of the Baltimore Y. and Merle Jennings of Michigan State, were successful in heavier weight divisions. After being dethroned from the 191-lb. title in 1942, Henry Wittenberg regained his third championship in this division during 1943. (M. P. W.)

Wyoming. A Rocky mountain state, admitted to the union July 10, 1890, as the 44th state. Leadership in the extension of rights to women gave it the name "Equality state." Land area, 97,506 sq.mi.; water area, 408 sq.mi.; pop. (1940) 250,742. The rural population was 157,165; urban, 93,577; 229,818 native white; 950 Negro; 17,107 foreign born. Capital, Cheyenne (22,474). Other cities of 10,000 or more: Casper (17,964); Laramie (10,627); Sheridan (10,529).

History.—State officials in 1943 were: governor, Lester C. Hunt (D.); secretary of state, Mart T. Christensen (R.); auditor, William Jack (D.); treasurer, Earl Wright (R.); superintendent of public instruction, Esther Anderson (R.). In the general election of 1942, 30,771 Republican and 23,684 Democratic votes were cast. Wyoming supreme court justices in 1943 were: Ralph Kimball (R.), chief justice; Fred H. Blume (R.) and William A. Riner (R), associate justices.

Education.—In the 1942–43 school year there were 675 elementary schools, with an enrolment of 37,780 and with 1,725 teachers. The total salary for elementary teachers was $1,925,912.02. There were 86 high schools and 28 permit high schools (2 years only) with an enrolment of 12,670 students and with 813 high school teachers. The high school teachers' salaries totalled $1,131,373.53.

Public Welfare, Charities, Correction.—The state department of public welfare reported the following estimate of expenditures for 1943: aid to dependent children, $222,810 (5,042 cases); old-age assistance, $1,230,236 (34,335 cases); aid to the blind, $103,976 (122 cases); general relief, $191,737 (568 cases). In 1943 Wyoming had three correctional institutions, one State Training school, one industrial institute for boys and one industrial girls' school. The state board of charities reported the following estimated expenditures for 1943: penitentiary, $333,756 (average of 211 inmates) (this amount also included expenditure for Saratoga Hot Springs and penitentiary farms); industrial boys' school, $65,331 (45 inmates); industrial girls' school, $41,172 (94 inmates); State Training school, $110,620 (388 inmates); hospital for the insane, $164,112 (673 inmates). Other state institutions and their estimated expenditures for 1943 were: state children's home, $41,236.20; Wyoming general hospital, $177,174; Hot Springs State park, $13,261; tuberculosis sanatorium, $36,760; soldier's and sailor's home, $29,840.

Communication.—In Nov. 1943, state highways totalled 4,082 mi.; rural highways, 20,012 mi.; railroads, 1,996.20 mi. (main tracks, taxable).

Banking and Finance.—In Nov. 1943 there were 30 state banks with deposits of $37,307,918.90; and resources of $40,589,589.56. National banks numbered 26, with deposits of $94,975,753.52, and resources of $101,871,481.04. There were eight insured savings and loan associations in June 1943. Total state receipts for the fiscal year were $15,074,848.30; disbursements, $11,939,162.76; gross bonded debt $2,520.00.

Ranching and Agriculture.—Wyoming livestock products sold for approximately between $55,000,000 and $60,000,000, in 1943, and farm products were valued at between $10,000,000 and $15,000,000 for the same period.

Table I.—*Leading Ranch and Farm Products of Wyoming, 1943 and 1942*

Product	1943 (est.)	1942
Cattle	947,000	885,000
Sheep	3,781,000	3,934,000
Wool, lb.	33,340,000	33,320,000
Hogs	125,000	84,000
Tame hay, tons	775,000	801,000
Wheat, bu.	3,430,000	4,259,000
Sugar beets, tons	270,000	451,000
Dry beans, cwt.	1,378,000	1,024,000
Corn, bu.	1,243,000	2,013,000
Potatoes, bu.	2,175,000	2,240,000

Manufacturing.—The value of all manufactures, excluding oil refining and dairying, was estimated at $10,000,000 in 1942. No figures for 1943 were available at the end of the year.

Mineral Production.—The total value of Wyoming's principal mineral production in 1943 was estimated at $46,247,392. Petroleum was the principal mineral product. The largest producer among numerous fields was Lance Creek.

Table II.—*Principal Mineral Products of Wyoming, 1943 and 1942*

Mineral	Taxable valuation	
	1943	1942
Petroleum	$26,961,955	$24,642,310
Bituminous coal	16,362,739	13,150,992
Iron	2,722,550	2,804,551
Bentonite	201,149	112,893

(M. H. E.)

X-Ray. The use of the X-ray for diagnosis of protrusion of an intervertebral disk made further advance during 1943. Dandy advocated abolition of the use of contrast solutions in diagnosis of protruded intervertebral disk but this advice is applicable only to cases with typical symptoms. Confirmation of the diagnosis by X-rays made after injection of contrast solutions is considered advisable by most of the experienced surgeons in this field. Air as a contrast is unsatisfactory because of its low diagnostic accuracy.

A new contrast medium called "pantopaque" (ethyl iodophenylundecylate) was described. This is an iodized oil much lighter and less viscid than lipiodol. Because of its fluidity it can be manipulated into any locality within the membranes covering the spine and brain by tilting the patient on the movable horizontal table. Examination of the dorsal and cervical regions is thus facilitated.

The greatest advantage of "pantopaque" is the ease with which it can be withdrawn through the same needle with which it is injected when the diagnostic procedure is finished. There is a further advantage that even if a small amount remains in the spinal canal it disappears after a few weeks, either disseminated in the spinal fluid or possibly absorbed.

Angiocardiography.—Since Robb and Steinberg in 1938 described a method for rendering opaque the heart chambers and large intrathoracic blood-vessels considerable practical advance was made in the clinical use of the method. The conditions in which it was found of value are listed in a review by Weber. They included congenital heart disease, coarctation of the aorta, aneurysm, and various intrathoracic conditions with associated changes in the size and contour of the heart and great vessels. Taylor and Shulman and Steinberg, Grishman and Sussman reported on the use of this method in diagnosis of various heart diseases and Liberson and Liberson published an interesting experimental article on the use of the method to diagnose pulmonary embolism.

The method consists in the intravenous injection, usually into a vein of the arm, of diodrast (3.5 - diiodo -4- pyridone -N- acetic acid and diethanolamine). They used in the average case 35 cc. of a 70% solution of the drug (24.5 gm. of diodrast).

The method appeared to be harmless and doubtless would be increasingly used to aid in the diagnosis of the unusually difficult heart and vascular conditions which older methods failed to make clear.

Cholecystography.—A new contrast medium has recently been devised to replace tetraiodophenolphthalein for gall-bladder

study. The name of the substance is priodax (beta-(4-hydroxg-3, 5- diiodophengl)-alpha-phenyl propionic acid). The advantages of priodax over tetraiodophenolphthalein were: 1. It does not contain phenolphthalein and does not act as a cathartic. This assures better absorption since it remains in the intestinal tract for a longer time. 2. It is less toxic. 3. It is almost completely absorbed from the intestinal tract and therefore does not produce opacities which conflict with the gall-bladder shadow. 4. It is easily and simply administered in tablet form. 5. The filling of the gall bladder is better than with other methods because of the complete absorption of the drug from the intestinal tract. (*See* also PHOTOGRAPHY; TUBERCULOSIS.)

Yachting. Fewer yachts were racing in 1943 than in 1942, due chiefly to the absence of many owners in the services or war work, but most of the recognized classes of smaller yachts were out and races were scheduled at most yachting localities. As in 1942, few of the larger yachts were out, being either in government service or laid up for the duration, except on the Great Lakes, where restrictions were fewer.

The two chief yachting events on the east coast, Larchmont race week, and the midsummer series at Marblehead, were held as usual, with a good showing in the smaller classes. At Larchmont, which held its 45th annual "week," 546 starts were recorded on the five days of racing, and at Marblehead, cradle of the sport on the New England coast, as many as 130 yachts started on several of the seven days of racing.

While the Star class sailed its chief event, the International championships, only two countries outside the United States were represented, Cuba and Venezuela, and all contestants sailed in boats furnished by the home fleet where the races were sailed, on Great South bay, Long Island. With 19 starters, sailing five races, the championship went to A. M. Deacon, representing Western Long Island sound, with 79 points. W. H. Picken, Jr., Great South Bay fleet, was second with 76 points, and C. de Cardenas, Cuba, third with 74. The Atlantic coast championship in the same class, was won by Horace Havemeyer, in "Gull II." Another important intersectional event was sailed as usual, the Barthel trophy race, representing the crew championship of the Great Lakes. Sailed on Lake St. Clair in 8-metre yachts, between crews representing Lakes Ontario, Erie and Michigan, it was won by the Lake Ontario crew headed by Elmer J. Doyle of Youngstown, N.Y., with Lake Erie second.

The Intercollegiate National Dinghy championship was sailed on Charles River basin, Boston, and was won by the Massachusetts Institute of Technology crew, 152 points, with Harvard second, 145 points. The McMillan trophy race, representing the Intercollegiate championship, sailed in June off Marblehead, was also won by M.I.T. with Harvard second. Other important intersectional championships were those in the Lightning class, sailed off Bay Head, N.J., which was won by Karl Smithers of Buffalo, and the Gulf Yachting association Lipton trophy, sailed in Fish class sloops, which was won by the Southern Yacht club crew with 35 points, Biloxi Yacht club crew second with 31 points.

Long-distance racing, always a popular part of a yachting season, was confined to the Great Lakes in 1943. Here, the two chief events of former years were sailed, the Chicago-Mackinac race of 333 mi. and the Port Huron-Mackinac, on Lake Huron. The former was sailed in two classes, racing and cruising. The Class Q sloop "Gloriant," owned by Vita Thomas, won the Mackinac cup in the racing class, while the sloop "Lassie," W. J. Lawrie, owner, took the Chicago-Mackinac trophy in the cruising division with "Tahuna," J. T. Snite, second.

In the somewhat shorter Port Huron-Mackinac race, "Apache," a N.Y.Y.C. 32-ft. class sloop, owned by Wilfred Gmeiner, was first in the racing-cruising class; the 8-metre "Shamrock," sailed by Ernest Grates took the racing class first prize, and in the cruising division, Andrew Langhammer's "Rambler VI" was the winner. All such events on the coasts had to be cancelled on account of war time restrictions. (H. L. ST.)

Yale University. An institution of higher education at New Haven, Conn. During 1943 the transfer to a war basis was completed. The army air force technical training command took over a large portion of the university's facilities and established a cadet school with an enrolment averaging 3,000. A navy V-12 program began July 1, with 1,500 undergraduates enrolled. At the same time, the army specialized training program was instituted with about 850 men, later increased to 1,500. After July 1943, except for certain students deferred as civilians for special essential training, or in 4-F, there were no undergraduates at Yale over 18 who were not in uniform. Yale was selected by the army for engineering, medical, and area and language training, the latter covering Japanese, Burmese, Chinese, Malay, Russian and Italian; advanced work was given for medical students, the military intelligence section and the civil affairs specialists training school. For the navy, courses were given in engineering and medicine, as well as in various basic studies.

Several committees in postwar planning were set up, and the research activities of the Institute of International Studies were expanded. Eight graduate fellowships of $2,500 a year each were established for advanced studies in the liberal arts.

Laboratory research was devoted to the war effort in many fields, including vitamin production, food dehydration, aeronautics, military clothing, high-altitude physiology and marine food resources. Among important acquisitions by the Yale library was the William Robertson Coe collection of Western Americana. The Yale Art gallery received the Maitland Griggs collection of early Italian paintings. For statistics of faculty, enrolment, endowment, etc., *see* UNIVERSITIES AND COLLEGES.

Yamamoto, Isoroku (1884–1943), Japanese naval officer, was born April 4 at Nagoaka, Japan. He was graduated from the naval academy in 1904 and fought as an ensign in the Russo-Japanese war. He was naval attaché in the Japanese embassy in Washington, 1925. As Japanese delegate at the London naval conference in 1934–35, he successfully fought the Anglo-American proposal to extend the naval "holiday." Yamamoto thereafter won rapid promotion. Foremost Japanese advocate of combining air and sea power in naval attacks, he was promoted to commander-in-chief of the fleet in 1939. Referring to the Japanese surprise attack on Pearl Harbor, Domei (Japanese) news agency revealed in a dispatch on Dec. 17, 1941, that the strategy of surprise carried out by Adm. Yamamoto was planned by him earlier.

A Tokyo radio report announced that he had been mortally injured in action while directing naval operations from a plane on a "far southern front," in April 1943, and that he had died shortly afterwards. The fact that no major engagements had taken place in that theatre of operations during the month cast doubt on the Japanese reports as to the circumstances surrounding his death. While Yamamoto was on his deathbed, the emperor promoted him to fleet admiral on April 20. He was succeeded by Adm. Mineichi Koga.

Yamashita, Tomoyuki (? -), Japanese army officer, was a close student of German military tactics. An able strategist, he trained Japanese soldiers in the technique of jungle warfare and conceived the military plan for the Japanese invasion of Malaya, 1941–42. His troops infiltrated the Malayan wilderness as independent units and, aided by native fifth-columnists, successfully marched through narrow jungle roads and paths that the British general staff thought were impenetrable. After a 10-week campaign, Singapore surrendered to Gen. Yamashita on Feb. 15, 1942. On March 9, after the failure of Gen. Masaharu Homma's drive to dislodge the U.S.-Filipino forces from the Bataan peninsula, Gen. Yamashita assumed command of the Philippines campaign. With a numerically superior army and air force, he won the battle of Bataan, April 9 and conquered the Corregidor island fortress, May 6, 1942. On Feb. 10, 1943, the Berlin radio broadcast a Tokyo dispatch that Yamashita, "supreme commander of forces in Malaya," had been promoted from lieutenant general to full general.

Yaroslavsky, Emelyan (1878?–1943), Russian historian and politician, was one of the original members of the "Old Bolsheviks." He was president of the League of Militant Atheists from its inception in 1927 and waged a ceaseless "educational" war against religion in the U.S.S.R. He was also a member of the Russian Communist party's central executive committee and a deputy of the supreme soviet. After the German invasion of the U.S.S.R. in June 1941, Premier Stalin apparently ordered Yaroslavsky to soft-pedal his campaign so as not to offend Russia's allies, who were deeply concerned over the "Godless" aspect of Russian culture. Yaroslavsky's death was reported in a Moscow broadcast according to newspaper dispatches of Dec. 5.

Yemen: *see* ARABIA.

Yeremenko, Andrei Ivanovitch (1892–), Russian army officer, was born Oct. 14 in Markova, the Ukraine. Drafted into the imperial Russian army in 1913, he became a corporal in 1914 and saw service in World War I on the eastern front. He became a guerrilla leader after the Brest-Litovsk peace signed by Germany and Russia, joined the red army during the revolution, and rose to the rank of officer in a cavalry unit. After the establishment of the soviet regime, Yeremenko, a student of strategy, attended the high cavalry school, the military-political academy and the Frunze military academy. During World War II, Yeremenko was given command of a field army on the northwest front, 1941–42 and in 1942–43 he was assigned to the Stalingrad front. During the bitter struggle for the Volga city, Yeremenko was wounded seven times and acquitted himself with valour.

He was decorated with the Order of the Red Banner, promoted to the rank of colonel general and in Aug. 1943, was raised to the rank of a full general.

Yersin, Alexandre Émile John (1863–1943), Swiss bacteriologist, was born Sept. 22 at Rougemont, Switzerland. He did notable work on the diphtheria bacillus and diphtheria serum. He also discovered the bubonic plague bacillus and succeeded in making a serum to combat the disease. Since the 1890s, Dr. Yersin lived in the far east where he directed the Pasteur institute at Nhatrang, French Indo-China. He died in French Indo-China according to a Berne dispatch of March 2. (See *Encyclopædia Britannica.*)

Young, Arthur Henry (1866–1943), U.S. artist and cartoonist, was born Jan. 14 near Orangeville, Stephenson county, Ill. He studied art in Chicago at the Academy of Design, 1884–86, and worked as illustrator and cartoonist for Chicago newspapers, 1884–94. He went to Denver in 1895, was co-editor of the *Masses*, 1911–19, was Washington correspondent for the *Metropolitan* magazine, 1912–17, and editor and publisher of *Good Morning*, 1919–21. He contributed illustrations and cartoons to many of the nation's best-known magazines and was contributing editor to the *New Masses*, Communist weekly. A talented and brilliant political cartoonist, he took an active part in campaigns for woman suffrage, labour organization, racial equality and abolition of child labour. Among his books are *Trees at Night* (1927), *On My Way* (1928), *Art Young's Inferno* (1933), *The Best of Art Young* (1936) and *Art Young, His Life and Times* (1939). He died in New York city, Dec. 29.

Young Men's Christian Association. In 1943, Howard A. Coffin became president; Eugene E. Barnett was general secretary. At the end of 1943 there were 1,300 local associations and 1,200,000 members, of whom 60% were under 25, in cities, colleges, high schools, rural areas, railway and industrial centres. War emergency services dominated the program. As a principal agency of the United Service Organizations, the Y.M.C.A. was designated to operate work in 445 communities near military establishments and in 60 overburdened war production centres. Y.M.C.A. personnel were provided for U.S.O. operations in various off-shore bases. American service men in many parts of the world were served by Y.M.C.A. movements of those countries. Work among prisoners of war was continued and enlarged at a cost of about $2,000,000. Some 76 neutral representatives of the World's Committee of Y.M.C.A.'s visited prison camps for conference with camp leaders about prisoners' recreational, educational and religious needs. American co-operation through staff and emergency aid was given to indigenous association movements of Free China, India, Egypt, Palestine, Turkey and Latin America. Local associations in the United States stressed wartime youth needs despite absence of large numbers of members and group leaders in military service. Extensive co-operation was given to local defense efforts and other community organizations. Special physical fitness programs were conducted. Citizenship education for American responsibility for postwar world order was stressed

(O. E. P.)

Young Womens Christian Association.

The regular ongoing program of the Y.W.C.A. in the United States was adapted and expanded in 1943 to meet wartime conditions. As an international Christian women's organization, it was concerned not only with providing war service to women and girls in the United States but also to the many thousands who turn to the Y.W.C.A. in other countries for help. Through the World Emergency and War Victims fund, financial support and personnel was given to those associations to assist in meeting the needs of the women and girls in uniform as well as farm and factory workers; in providing youth centres for children of working mothers; and in the relief and restoration of war victims. Support for the World Emergency and War Victims fund comes in the main from the National War fund and in part from the Church Committee on Overseas Relief and Reconstruction. In the United States, the Y.W.C.A. as a member agency of the United Service Organizations, Inc., was responsible for 239 U.S.O. operations serving men and women in the armed forces and in war production industries. The year 1943 saw also the beginning of another special project, Y.W.C.A. War-Community

Service, organized for the purpose of providing necessary recreational and other facilities for women and girls in over-crowded war industry communities where such facilities do not exist or are inadequate to meet the need. This service was one of six national agency projects comprising American War-Community Services, Inc., and was financed by local war chests.

(M. S. Ss.)

Youth Administration, National: *see* NATIONAL YOUTH ADMINISTRATION.

Youth Movements. Youth movements, organized efforts at political self-expression of young people, were dominated in 1943 by the universal war effort. In the totalitarian countries, whether communist or fascist, the youth movements continued strictly controlled by the respective governments as instruments of governmental policy. The efforts undertaken in 1942 to organize the youth in the democratic countries and in the axis countries for international action on a large scale were not renewed. The youth movements of the different religious organizations were carried on in the democratic countries, devoting much of their attention to the problems caused by the war and to the organization of the future peace. In fascist countries national youth organizations were formed to which all students must belong, while the world-wide Christian youth organizations like the Y.M.C.A, the Y.W.C.A and the Student Christian movement had been forbidden because of their international connections.

In the United States the newly organized United States Student assembly held its first meeting in May 1943. By its constitution it called itself "a confederation of autonomous democratic student groups, organized democratically and bound together by the common belief that democracy is the only just society." Communist organizations were barred from membership, when the Young Communist league tried to gain admission, because they were "not democratic by their very nature" and on account of their "mercurial foreign policy which changed according to the Moscow weather at any moment." The U.S. Student assembly called for "a dynamic revision of our society to banish political, economic and social insecurity" and for "a new America—not made new by changing our ideals, but by more complete acceptance of them." The assembly regarded itself as the American branch of the International Student assembly. The question of communist participation in democratic youth organizations came up again when the Young Communist league dissolved itself in Oct. 1943 and formed a new organization called "American Youth for Democracy" to unite communist and non-communist youth. The new organization called for an American-Soviet-British coalition, for the opening of a second front and for universal, obligatory military training for youth after the war. The democratic youth, however, did not join and regarded the formation of the new organization as an attempt of the communists to confuse the issues. (*See* also CATHOLIC ORGANIZATIONS FOR YOUTH.) (H. Ko.)

Yugoslavia. A kingdom in southeastern Europe, partitioned as a result of German aggression in 1941. Area 95,576 sq.mi.; pop. (est. Jan. 1, 1940) 15,703,000. Capital: Belgrade (266,849). Other chief cities: Zagreb (185,581); Subotica (100,058); Ljubljana (79,056); Sarajevo (78,173). Religion: 6,785,501 Greek Orthodox; 5,217,910 Roman Catholic; 1,561,166 Mohammedans; 231,169 Protestants; 68,405 Jews. King: Peter II; prime minister (1943): Bozhidar Puritch.

History.—The situation in Yugoslavia continued throughout 1943 in a troubled state, further complicated by the collapse of Italy. The unrest and bitterness produced by the occupation of Yugoslavia was also much increased by the internal struggle among the Yugoslavs themselves. This disunity had two aspects, often so interconnected that it was difficult to gain a clear picture of the forces and trends at work. There was first the resistance movement against the armies of occupation, especially the German and (until Sept.) the Italian armies. This movement was, however, divided into two camps violently hostile to each other and often in bitter armed conflict. One of these patriot armies, the Chetniks, was led by General Draja Mikhailovitch, minister of war in the Yugoslav cabinet. The other, generally called the Partisans, was led by General Tito, a Croat communist, whose real name was Josip Brozovich. The forces of Mikhailovitch represented mainly the Serb army and guerrillas, while those of Tito included Serbs, Croats and Slovenes and were of a more leftist political conviction, often representing an agrarian communism, yet accepting in their ranks men of all parties and classes, peasants, workers, intellectuals, officers and priests. For some time it seemed as if Tito's forces were supported by soviet Russia while the United States and Britain supported the forces of Mikhailovitch.

The Yugoslav government in London, recognized as one of the United Nations, reflected during 1943 the internal tensions of the homeland and was frequently reorganized. On Jan. 2 a new cabinet was formed in which Professor Slobodan Yovanovitch was not only prime minister but also minister of the interior and of foreign affairs. The cabinet resigned on June 17 because it was unable to define a satisfactory postwar policy. On June 26 a new cabinet was formed with Milosh Trifunovitch, deputy leader of the Serb radical party, as prime minister and Milan Grol, leader of the Serbian democratic party, as minister of foreign affairs. In a broadcast on June 28, a national holiday of the Serbs, King Peter promised his people that after their liberation they would be free "to decide on their own fate in conformity with the principles of democracy."

As a result of Serb-Croat tension the cabinet of Trifunovitch resigned on Aug. 10 and was followed by a cabinet with Dr. Bozhidar Puritch, a Serb diplomat, as prime minister. The Yugoslav government transferred its seat at the beginning of October from London to Cairo. From there on Oct. 7 King Peter called on his people to "obey Mikhailovitch and other national leaders of your resistance to the enemy and refrain from internal struggle." Thereby the king recognized officially the existence of other liberation movements especially that of Tito. On Oct. 16 the Yugoslav government was broadened by the inclusion of three new members, two Croats and one Slovene.

Meanwhile the struggle in Yugoslavia went on. The patriotic armies were able to wrest important territory from German control and at times many important cities in Dalmatia and Bosnia were entirely under patriot control. But the attempts of creating a united front of the patriots failed.

At the beginning of the summer of 1943 the British government established military liaison with the Yugoslav partisans under Tito, according to an official statement of the British general headquarters for the middle east on July 21. The British were already in liaison with the forces of Mikhailovitch. In mid-September the Partisans controlled Fiume and Spalato on the Adriatic coast but soon they were forced out by superior German forces. They had seized some of the equipment of the Italians, but it was in no way sufficient to allow them major operations against the German army.

On Dec. 4 the Partisan movement announced that it had set up a provisional regime in opposition to the existing Yugoslav government in exile. It was reported that 140 delegates had created a parliament and government for the territory already won back from the Germans. Dr. Ivan Ribar, first president of

he constitutional assembly of Yugoslavia after World War I, was elected head of the government, and General Tito was named ieldmarshal and chairman of the committee for national defense. A regular cabinet was formed, the three vice-presidents being espectively a Serb, a Croat and a Slovene. In the British parliament it was disclosed officially on Dec. 8 that the larger part of British supplies and arms sent to Yugoslavia had been going or some time to Tito's forces. On Dec. 14 Foreign Secretary Anthony Eden announced that the British military mission was eaded by Fitzroy Maclean, a former member of the British oreign office. The soviet government followed the British example and announced on Dec. 14 that it would also send a military mission to Yugoslavia.

By the end of Dec. 1943, the hostility between Tito's Partisans and the government in exile which had supported Gen. Mikhailovitch took on more and more violent form. Tito's council issued a manifesto depriving the government in exile of all rights and accusing Mikhailovitch openly of a hostile attitude and of organizing civil strife. The government in exile denied these charges and maintained the legitimacy of its position. (H. Ko.)

Yukon Territory. Yukon Territory lies in the extreme northwest of continental Canada, bounded by Alaska, British Columbia, the Northwest Territories and the Arctic ocean. Area, 207,076 sq.mi.; pop. (1941) 4,914. Seat of government, Dawson. Local administration is in the hands of a territorial legislative council composed of three members elected triennially, and a controller. The Yukon is represented at Ottawa by one member in the house of commons. From June to October, steamships ply regularly from White Horse to Dawson.

The chief industry is mining, followed by fur trading and fishing. For the first nine months of 1943, gold production shrank to 30,111 oz., as compared with 53,137 oz. produced in the same period of 1942. The fur haul in 1941–42 represented a value of $398,132 as compared with a value of $373,399 for 1940–41. The fishing catch for 1942 was valued at $3,056. With the completion of the Alaska highway, the Yukon was brought into direct communication with the rest of the dominion. Communications within the territory are maintained chiefly by plane, and, during the season of navigation, by steamship. A railway from White Horse to Skagway (Alaska) gives access to the Pacific. (J. I. C.)

Zanzibar and Pemba: *see* BRITISH EAST AFRICA.

Zeeman, Pieter (1865–1943), Netherlands physicist, was born May 25 at Zonnemaire, Zeeland. The discoverer of the Zeeman effect, a phenomena produced in spectroscopy, and winner of the Nobel prize in 1902 he died in Amsterdam, Oct. 9, according to a broadcast from a German-controlled Netherlands station. (See *Encyclopædia Britannica.*)

Zeitzler, Kurt (1895–), German army officer, was born in Luckau, Brandenburg, Germany. He volunteered in World War I and served as infantry lieutenant, resigning his commission after the armistice. He rejoined the reichswehr in 1926 as a captain, became a major in 1934, a colonel in 1935, a major general early in 1942 and then a full general. He commanded an infantry unit during the Polish campaign in Sept. 1939, and was chief of staff to Gen. Von Kleist during the Battle of France, May–June 1940. He was also chief of staff to Gen. Von Rundstedt on the French invasion coast in 1942. In the winter of 1942 Zeitzler was made chief of the German general staff, replacing Gen. Franz Halder. During 1943 he was at some of Hitler's conferences, including one in January with the Rumanian premier, Antonescu, and a meeting with Mussolini in April.

Zhukov, Georgi Konstantinovich (? –), Russian army officer, joined the Russian imperial army as a private in 1915. After the revolution, he attended the Frunze military academy, where he received his military training under Gen. Boris Shaposhnikov, crack soviet strategist. He was named chief of the red army general staff and vice-commissar for defense, Feb. 1941. During the nazi drive on Moscow in the fall of 1941, Zhukov was given command of the capital's defense forces on Oct. 23, replacing Gen. Timoshenko, who was sent to the southern front. The German offensive at one time reached a point some 20 miles from Moscow, but there Russian armies held fast. Zhukov's armies launched a series of counterattacks; in December, German defenses cracked under the hammering Russian blows, and Hitler's armies fell back on nearly all sectors of the immense Moscow front. There he directed the counteroffensive at Stalingrad, for which he later received Stalin's personal congratulations. He did not remain to direct the last steps, however, for early in Jan. 1943 he was sent to Moscow to co-ordinate the forces for raising the siege of Leningrad. The siege was lifted Jan. 18, and on Jan. 29 Zhukov was awarded the Order of Suvorov, first degree, for his part in the campaign.

Zinc. Production figures for zinc after 1940 were received only from the United States, so that no data for 1941 and 1942 can be added to the world table.

World Production of Zinc
(In thousands of metric tons)

	1929	1937	1938	1939	1940
Australia	50.8	70.9	70.9	70.8	85.0
Belgium	197.9	225.6	210.4	185.7	65.0
Canada	78.1	143.9	155.7	161.8	180.0
France	91.6	60.4	62.2	60.3	35.0
Germany	102.0	163.3	192.5	212.3	225.0
Norway	6.4	41.3	46.5	45.0	20.0
Poland	169.0	109.3	110.8	117.9	160.0
U.S.S.R.	3.4	70.0	80.0	90.0	95.0
United Kingdom	59.2	63.1	56.2	50.4	60.0
United States	573.0	534.9	414.6	488.3	657.0
World Total	1,472.8	1,667.9	1,589.7	1,678.1	1,732.0
Ex. U.S.	899.8	1,133.0	1,175.1	1,189.8	1,148.0

The recoverable metal content of zinc ores mined in the United States increased from 749,125 short tons in 1941 to 760,210 tons in 1942, an increase of only slightly over 1%. Increases of output in Colorado, Missouri, New Mexico, New York, Idaho, Tennessee, Utah and five other states with minor changes totalled 68,946 tons; this was largely offset by decreases totalling 57,851 tons in Oklahoma, Kansas, Montana, Virginia, Nevada and three other states. In each list, the states are arranged in decreasing order of the magnitude of the tonnage change. In the tri-state district of Oklahoma, Kansas and southwest Missouri, the largest producing area, 8,513,000 tons of ore and 9,921,000 tons of tailings represented an increase of 6% in the tonnage treated during the year, but a decline in yield resulted in a drop of zinc produced from 258,837 tons in 1941 to 236,965 tons in 1942.

During 1942 and 1943 censorship prevented the publication of smelter output, but this restriction was removed in Dec. 1943. The smelter output in the United States from both domestic and foreign ores was 929,770 short tons in 1942, and 889,656 tons through Nov. 1943. The latter figure is at a rate of 970,512 tons for the year, an improvement of 4% over 1942. The returns for domestic ore in 1943 were not available at the close of the year, but in 1942 there was a drop to 629,957 tons, as compared with 652,599 tons in 1941. Domestic sales increased from 733,918 tons in 1942 to 742,916 tons through Nov. 1943, equivalent to a rate of 810,454 tons for the full year, and a rise of 10% over 1942.

In contrast, export sales dropped heavily, from 151,650 tons in 1942 to only 55,136 tons through Nov. 1943. Total sales in 1943 were at a rate of 870,601 tons, as compared with 885,568 tons in 1941. Stocks had been critically low throughout 1940 and 1941, and up to May 1942. Increased production and decreased sales built the stocks up from a low of 18,477 tons at the end of May 1942, to 65,268 tons at the end of the year, with even better results in 1943, reaching 159,853 tons at the end of November. Although this would be an abnormally high figure for stocks under normal conditions, it represented only about two months' average output under current conditions.

An unofficial report stated that the zinc output of Canada in 1942 was 216,000 short tons, equivalent to 20% of the combined output of the United Nations. (G. A. Ro.)

Zirconium. No information was made public in the U.S. on zirconium in 1943, beyond the fact that the supply was improved; formerly listed as supply in balance with essential demand, the year closed with a surplus supply. How much of this improvement came from domestic output, and how much from imports, was not known. There were small-scale recoveries of zircon from beach sands in Florida for several years, and more extensive operations were planned. (G. A. Ro.)

Zoology. The year 1943 saw curtailment of zoological science in some areas of the U.S. and expansion in others. The expansion dealt largely with the teaching of premedical zoology; particularly in those colleges and universities engaged in training army or navy cadets under government contract. Broadly, most of these programs required the teaching of general zoology (botany was included in naval programs but not in army), comparative vertebrate anatomy and vertebrate embryology. The details, of course, differed both between army and navy requirements as well as between institutions. These training programs served the double function of rapidly preparing pre-professional students in basic biological science and of making it possible for many zoologists to remain actively engaged in their profession on home grounds. Zoology also expanded in certain applied areas; especially as related to agriculture through economic entomology and to medicine through parasitology. The curtailment of zoology occurred along four lines: (1) In teaching not associated with medicine or veterinary medicine; (2) in loss of students and investigators to the war effort; (3) in basic research (although a commendable amount of this was done), and (4) in national and regional meetings and activities at summer biological stations. To document the last point, total attendance at the Marine Biological station (Woods Hole, Mass.) dropped from 461 in 1941 to 273 in 1942 to 228 in 1943. For another year the American Association for the Advancement of Science did not meet. Thus, members of such societies as the American Society of Zoologists and the Ecological Society of America could not get together for the exchange of ideas. However, certain organizations (the American Society of Zoologists, for example) published detailed abstracts of the current researches of its membership. These were widely circulated.

Research.—A problem that has long interested zoologists concerns the adjustments necessary for ocean animals to evolve into fresh water forms. The palaeontologist and morphologist advance evidence to show that the ancestors of the major phyla arose in the sea. In 1943, confirmatory evidence based on physiological considerations, appeared in a paper by L. C. Beadle. To invade fresh waters, marine animals must maintain a total body-fluid concentration greater than that of the external environment. Some animals, such as the marine worm *Nereis diversicolor*, show the beginnings of osmotic regulation. When in fresh or slightly salty water this species maintains for a time an internal salt concentration which is greater than that of the surrounding water. This permits the worms to enter brackish water. On the other hand, other forms such as certain crustacea withstand dilute sea water by virtue of another type of mechanism; one which prevents essential diminution in the concentration of body fluids. In such organisms this is accomplished by active absorption of salt from the medium through gills or other parts of the body surface. Thus, one type of physiological mechanism retains salt that is present (*Nereis*) while another brings in extra salt which then is stored in fluids and tissues (crustacea). It seems likely that devices such as these have been used by animals in their emancipation from the sea.

W. H. Johnson and E. G. Stanley Baker showed that the size of populations of a ciliate protozoan, *Tetrahymena*, was increased when vitamin B_1, thiamin hydrochloride, was added to the medium in certain concentrations. This greater population size was due, not to an acceleration of individual reproductive rate, but rather to an extension of the period of maximum cell division beyond that characteristic of controls in which thiamin was low or absent. Certain cultures, to which two other B-complex vitamins (riboflavin and pyridoxin) were added in addition to the thiamin, maintained the largest living populations. This research, dealing as it does with relatively simple one-celled creatures, demonstrated anew that the need for vitamins is not limited to "higher" forms but is something quite general among animals.

In 1943 W. F. Lamoreux studied the effect of light on the weight of white leghorn cockerels. In his experiments other factors such as food, temperature and genetic stock were controlled. He found that, when the birds were exposed to light for nine hours daily, they weighed significantly more after six weeks of such treatment than did birds exposed for 12 hours daily. Further, roosters that got only four hours of light in each 24 weighed more than did those that got 14 hours. Lamoreux reached the interesting conclusion that gains in the body weight of domestic fowl are greatest when the daily period of light is inadequate for the maximum stimulation of reproduction. Thus, midwinter light conditions, while excellent for inducing growth, are not favourable for the development of the gonads with consequent reproduction. (*See* also MARINE BIOLOGY.)

Zoological Gardens.—Postwar plans for zoos were being made, particularly in the United States. The New York Zoological society was planning a research centre for the study of animal diseases in relation to human diseases. It was to receive for this purpose $3,000,000 under a postwar program, and was to contribute $20,000 towards a $1,500,000 postwar aquarium or oceanarium at Coney Island, containing fresh- and salt-water animals from all over the globe. Dr. David L. Coffin was appointed to the Herbert Fox memorial fellowship in comparative pathology by the Zoological Society of Philadelphia. The fellowship provides for half-time work at the zoo by faculty members of the school of veterinary medicine interested in the diseases of wild animals.

In Great Britain, Winston Churchill was elected honorary fellow of the London Zoological society. The lion presented to him to commemorate his African visit was the father of cubs born in the zoo. H. Vinall collected fresh-water fish for the first wartime opening of the aquarium. Many tropical fish were to remain in the congenial temperature of the reptile house. (V. R.)

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* in which the articles appear. For example, **"American Iron and Steel Institute 44, 43, 42, 41"** indicates that the entry "American Iron and Steel Institute" is to be found in the *1944 Book of the Year*, the *1943 Book of the Year*, the *1942 Book of the Year* and the *1941 Book of the Year*. The reference **"Adult Education: *see* Education 44, 43, 42. *See* Education, Adult 41, 40"** indicates that the entry "Adult Education" is to be found in the article "Education" in the *1944 Book of the Year*, the *1943 Book of the Year*, and the *1942 Book of the Year*, and under the heading "Education, Adult" in the *1941 Book of the Year* and the *1940 Book of the Year*. **All black type entries without dates indicate that the same entries appear in all previous issues. Examples,** not **Advertising 44, 43, 42, 41, 40,** but **Advertising;** not **Academy of Arts and Letters, American: *see* American Academy of Arts and Letters 44, 43, 42, 41, 40,** but **Academy of Arts and Letters, American: *see* American Academy of Arts and Letters.**

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text (of this issue only) not given a special article. All the light type headings show page references.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
